quite unjust to consider the work of the alchemists, who tried to make artificial gold, as consummate nonsense. *A priori* there was no reason why a change from lead to gold should be less possible than a change from iron to rust; indeed there is no a priori reason against it now. But experience has taught us that lead and gold are chemical elements in the modern sense, and that there is a general experimental law that elements are not transformed into one another. So experience taught the alchemists irresistibly that in spite of the manifoldness of chemical changes it is not always possible to change any given substance into another; the possibilities are much more limited, and there is only a certain range of substances to be obtained from a given one. The impossibility of transforming lead or copper into noble metals proved to be only one case out of many, and it was recognized generally that there are certain chemical families whose members are related to one another by their mutual transformability, while it is impossible to bridge the boundaries separating these families.

The man who brought all these experiences and considerations into scientific form was Robert Boyle. He stated as a general principle, that only tangible and ponderable substances should be recognized as elements, an element being a substance from which other substances may be made, but which cannot be separated into different substances. He showed that neither the peripatetic nor the alchemical elements satisfied this definition. But he was more of a critical than of a synthetical turn of mind; although he established the above principle, he hesitated to point out what substances, among those known at his time, were to be considered as elements. He only paved the way to the goal by laying the foundations of analytical chemistry, *i.e.* by teaching how to characterize and to distinguish different chemical individuals. Further, by adopting and developing the corpuscular hypothesis of the constitution of the ponderable substances, he foreshadowed, in a way, the law of the conservation of the elements, viz. that no element can be changed into another element; and he considered the compound substances to be made up from small particles or corpuscles of their elements, the latter retaining their essence in all combinations. This hypothesis accounts for the fact that only a limited number of other substances can be made from a given one—namely, only those which contain the elements present in the given substance. But it is characteristic of Boyle's critical mind that he did not shut his eyes against a serious objection to his hypothesis. If the compound substance is made up of parts of the elements, one would expect that the properties of the compound substance would prove to be the sum of the properties of the elements. But the experience of cases showed that the compounds show properties which generally differ very considerably from those of the compounds. On the one hand, the corpuscular hypothesis of Boyle was developed into the atomic hypothesis of Dalton, which was considered at the beginning of the 19th century as the very best representation of chemical facts, while, on the other hand, the difficulty as to the properties of the compounds remained the same as Boyle found it, and has not yet been removed by an appropriate development of the atomic hypothesis. Thus Boyle considered, *i.e.* the metals as elements. However, it is interesting to note that he considered the mutual transformation of the metals as not altogether impossible, and he even tells of a case when gold was transformed into base metal. It is a common psychological fact that a reformer does not generally succeed in being wholly consistent in his reforming ideas; there remains invariably some point where he commits exactly the same fault which he set out to abolish. We shall find the same inconsistency also among other chemical reformers. Even earlier than Boyle, Joachim Jung (1587-1657) of Hamburg developed similar ideas. But as he did not distinguish himself, as Boyle did, by experimental work in science, his views exerted only a limited influence amongst his pupils.

In the times following Boyle's work we find no remarkable outside development of the theory of elements, but a very important inside one. Analytical chemistry, or the art of distinguishing different chemical substances, was rapidly developing, and the necessary foundation for such a theory was thus laid. We find the discussions about the true elements disappearing from the text-books, or removed to an insignificant corner, while the description of observed chemical changes of different ways of preparing the same substance, as identified by the same properties, and of the methods for recognizing and distinguishing the various substances, take their place. The similarity of certain groups of chemical changes, as, for example, combustion, and the inverse process, reduction, was observed, and thus led to an attempt to shape these most general facts into a common theory. In this way the theory of "phlogiston" was developed by G.E. Stahl, phlogiston being (according to the usual way of regarding general properties as being due to a principle or element) the "principle of combustibility," similar to the "sulphur" of the alchemists. This again, must be regarded as quite a legitimate step justified by the knowledge of the time. For experience taught that combustibility could be transferred by chemical action, *e.g.* from charcoal to litharge, the latter being changed thereby into combustible metallic lead; and according to Boyle's principle, that only bodies should be recognized as chemical elements, phlogiston was considered as a body. From the fact that all leading chemists in the second half of the 18th century used the phlogiston theory and were not hindered by it in making their great discoveries, it is evident that a sufficient amount of truth and usefulness was embodied in this theory. It states indeed quite correctly the mutual relations between oxidation and reduction, as we now call these very general processes, and was erroneous only in regard to one question, which at that time had not aroused much interest, the question of the change of weight during chemical processes.

It was only after Isaac Newton's discovery of universal gravitation that weight was considered as a property of paramount interest and importance, and that the question of the changes of weight in chemical reactions became one worth asking. When in due time this question was raised, the fact became evident at once, that combustion means not less but gain of weight. To be sure of this, it was necessary to know first the chemical and physical properties of gases, and it was just at the same time that this knowledge was developed by Priestley, Scheele and others. Lavoisier was the originator and expounder of the necessary reform. Oxygen was just discovered at that time, and Lavoisier gathered evidence from all sides that the theory of phlogiston had to be turned inside out to fit the new facts. The total of the weights of all substances concerned within a chemical change is not altered by the change. This principle of the "conservation of weight" led at once to a simple and unmistakable definition of a chemical element. As the weight of a compound substance is the sum of the weights of its elements, the compound necessarily weighs more than any of its elements. An element is therefore a substance which, by being changed into another substance, invariably increases its weight, and never gives rise to substances of less weight. By the help of this criterion Lavoisier composed the first table of chemical elements similar to our modern ones. According to the knowledge of his time he regarded the alkalies as elements, although he remarked that they are rather similar to certain oxides, and therefore may possibly contain oxygen; the truth of this was proved at a later date by Humphry Davy. But the inconsistency of the reformer, already referred to, may be observed with Lavoisier. He included "heat and light" in his list of elements, although he knew that neither of them had weight, and that neither fitted his definition of an element; this atavistic survival was in the beginning removed from the table of the elements by Berzelius in the beginning of the 19th century. In this way the question of what substances are to be regarded as chemical elements had been settled satisfactorily in a qualitative way, but it is interesting to realize that the last step in this development, the theory of Lavoisier, was based on quantitative considerations. Such considerations became of paramount
interest at once, and led to the concept of the combining weights of the elements.

The first discoveries in this field were made in the last quarter of the 18th century by J. B. Richter. The point at issue was a rather commonplace one: it was the fact that when two neutral salt solutions were mixed to undergo mutual chemical decomposition and recombination, the resulting liquid was neutral again, i.e., it did not contain any excess of acid or base. In other words, if two salts, A'B' and A"B", composed of the acids A' and A" and the bases B' and B", underwent mutual decomposition, the amount of the base B' left by the first salt, when its acid A' united with the base B" to form a new salt A'B", was just enough to make a neutral salt A"B" with the acid A" left by the second salt. At first sight this looks quite simple and self-evident,—that neutral salts should form neutral ones again and not acid or basic ones,—but if this fact is once stated very serious quantitative inferences may be drawn from it, as Richter showed. For if the symbols A', A", B', B" denote at the same time such quantities of the acids and bases as form neutral salts, then if three of these quantities are determined, the fourth may be calculated from the others. This follows from the fact that by making A'B' with just the proper amount of the other salt to form A'B", the remaining quantities B' and A" exist in exactly the ratio to form a neutral salt A'B". It is possible, therefore, to ascribe to each acid and base a certain relative weight or "combining weight" by which they will combine one with the other to form neutral salts. The same reasoning may be extended to any number of acids and bases.

It is true that Richter did not find out by himself this simplest statement of the law of neutrality which he discovered, but he expressed the same consequence in a rather clumsy way by a table of the combining weights of different bases related to the unit amount of a certain acid, and doing the same thing for the unit weight of every other acid. Then he observed that the numbers in these different tables are proportionate to one another. The same holds good if the corresponding series of the combining weights of acids for unit weights of different bases were tabulated.

It was only a little later that a Berlin physicist, G. E. Fischer, united the whole system of Richter's numbers simply into a double table of acids and bases, taking as unit an arbitrarily chosen substance, namely sulphuric acid. The following table by Fischer is therefore the first table of combining weights.

It is interesting again to notice how difficult it is for the discoverer of a new truth to find out the most simple and complete statement of his discovery. It looks as if the amount of work needed to get to the top of a new idea is so great that not enough energy remains to clear the very last few steps. It is noteworthy also to observe how difficult it was for the chemists of that time to understand the bearing of Richter's work. Although a summary of his results was published in Berthollet's Essais de statique chimique, one of the most renowned chemical books of that time, nobody dared for a long time to take up the scientific treasure laid open for all the world.

At the beginning of the 19th century the same question was taken up from quite another standpoint. John Dalton, in his investigations of the behaviour of gases, and in order to understand more easily what happened when gases were absorbed by liquids, used the corpuscular hypothesis already mentioned in connexion with Boyle. While he depicted to himself how the corpuscles, or, as he pre-

Dalton at once drew a peculiar inference from this view. If two elements combine in different ratios, one must conclude that different numbers of atoms unite. There must be, therefore, a simple ratio between the quantities of the one element united to the same quantity of the other. Dalton showed at once that the analysis of carbon monoxide and of carbonic acid satisfied this consequence, the quantity of oxygen in the second compound being double the quantity in the first one. A similar relation holds good between marsh gas and olefiant gas (ethylene). This is the "law of multiple proportions" (see Atom). By these considerations Dalton extended the law of combining weights, which Richter had demonstrated only for neutral salts, to all possible chemical compounds. While the scope of the law was enormously extended, its experimental foundation was even smaller than with Richter. Dalton did not concern himself very much with the experimental verification of his ideas, and the first communication of his theory in a paper on the absorption of gases by liquids (1805) attracted as little notice as Richter's discoveries. Even when T. Thomson published his results, the chemists, in an appendix to his widely read text-book of chemistry, matters did not change very much. It was only by the work of J. J. Berzelius that the enormous importance of Dalton's views was brought to light.

Berzelius was at that time busy in developing a trustworthy system of chemical analysis, and for this purpose he investigated the composition of the most important salts. He then went over the work of Richter, and realized that by his law he could check the results of his analyses. He tried it and found the law to hold good in most cases; when it did not, according to his analyses, he found that the error was on his own side and that better analyses fitted Richter's law. Thus he was prepared to understand the importance of Dalton's views and he proceeded at once to test its exactness. The result was the best possible. The law of the combining weights of the
atoms, or of the atomic weights, proved to hold good in every case in which it was tested. All chemical combinations between the several elements are therefore regulated by weight according to certain numbers, one for each element, and combinations between the elements occur only in ratios given by these weights or by simple multiples thereof. Consequently Berzelius regarded Dalton's atomic hypothesis as proved by experiment, and became a strong believer in it.

At the same time W. H. Wollaston had discovered independently the law of multiple proportions in the case of neutral and acid salts. He gave up further work when he learned of Dalton's ideas, but afterwards he pointed out that it was necessary to distinguish the hypothetical part in Dalton's views from their empirical part. The latter is the law of combining weights, or the law that chemical combination occurs only according to certain numbers characteristic for each element. Besides this purely experimental law there is the hypothetical explanation by the assumption of the existence of atoms. As it is not proved that this explanation is the only one possible, the existence of the law is not a proof of the existence of the atoms. He therefore proved that the characteristic combining numbers of the elements are not "atomic weights" but "chemical equivalents."

Although there were at all times chemists who shared Wollaston's cautious views, the atomic hypothesis found general acceptance because of its ready adaptability to the most diverse chemical facts. In our time it is even rather difficult to separate, as Wollaston did, the empirical part from the hypothetical one, and the concept of the atom penetrates the whole system of chemistry, especially organic chemistry.

If we compare the work of Dalton with that of Richter we find a fundamental difference. Richter's inference as to the existence of combining weights in salts is based solely on an experimental observation, namely, the persistence of neutrality after double decomposition; Dalton's theory, on the contrary, is based on the hypothetical concept of the atom. Now, however favourably one may think of the probability of the existence of atoms, this existence is really not an observed fact, and it is necessary therefore to ask: Does there exist some general fact which may lead directly to the inference of the existence of combining weights of the elements, just as the persistence of neutrality leads to the same consequence as to acids and bases?

The answer is in the affirmative, although it took a whole century before this question was put and answered. In a series of rather difficult papers (Zeits. f. Phys. Chem. since 1895, and Annalen der Naturphilosophie since 1902), Franz Wald (of Klado, Bohemia) developed his investigations as to the genesis of this general law. Later, W. Ostwald (Faraday lecture, Trans. Chem. Soc., 1904) simplified Wald's reasoning and made it more evident.

The general fact upon which the necessary existence of combining weights of the elements may be based is the shifting character of the boundary between elements and compounds. It has already been pointed out that Lavoisier considered the alkalies and the alkaline earths as elements, because in his time they had not been decomposed. As long as the decomposition had not been effected, these compounds could be considered and treated like elements without mistake, their combining weight being the sum of the combining weights of their (subsequently discovered) elements. This means that compounds enter in reaction with other substances as a whole, just as elements do. In particular, if a compound AB combines with another substance (elementary or compound) C to form a ternary compound ABC, it enters this latter as a whole, leaving behind no residue of A or B. Inversely, if a ternary compound ABC be changed into a binary one AB by taking away the element C, there will not be found any excess of A or B, but both elements will exhibit just the same ratio in the binary as in the ternary compound.

Experimentally this important fact was proved first by Berzelius, who showed that by oxidizing lead sulphide, PbS, to lead sulphate, PbSO₄, no excess either of sulphur or lead could be found after oxidation; the same held good with barium sulphite, BaSO₃, when converted into barium sulphate, BaSO₄.

On a much larger scale and with very great accuracy the inverse was proved half a century later by J. S. Stas, who reduced silver chloride, AgClO₃, silver bromate, AgBrO₃, and silver iodate, AgIO₃, to the corresponding binary compounds, AgCl, AgBr, and AgI, and searched in the residue of the reaction for any excess of silver or halogen. As the tests for these substances are among the most sensitive in analytical chemistry, the general law underwent a very severe test indeed. But the result was the same as was found by Berzelius—no excess of one of the elements could be discovered. We may infer, therefore, generally that compounds enter into combinations without change of the ratio of their elements, or that the ratio between different elements in their compounds is the same in binary and ternary (or still more complicated) combinations.

This law involves the existence of general combining weights just in the same way as the law of neutrality with double decomposition of salts involves the law of the combining weights of acids and bases. For if the ratio between A and B is determined, this same ratio must obtain in all ternary and more complicated compounds, containing the same elements. The same is true for any other elements, C, D, E, F, &c., as related to A and B. Thus the law to the ternary compound ABC the same conclusion may be drawn as to the ratio A : C in all compounds containing A and C, or B : C in the corresponding compounds. By reasoning further in the same way, we come to the conclusion that only such compounds are possible which contain elements according to certain ratio-numbers, i.e., their combining weight. Any other ratio would violate the law of the integral reaction of compounds.

As to the law of multiple proportions, it may be deduced by a similar reasoning by considering the possible combinations between a compound, e.g., AB, and one of its elements, say B. AB and B can combine only according to their combining weights, and therefore the quantity of B combining with AB is equal to the quantity of AB which has combined with A to form AB. The new combination is therefore to be expressed by ABₓ. By extending this reasoning in the same way, we get the general conclusion that any compounds must be composed according to the formula AₓBₙCₚ... , where m, n, p, &c., are integers.

The bearing of these considerations on the atomic hypothesis is not to disprove it, but rather to show that the existence of the law of combining weights, which has been considered for so long as a proof of the truth of this hypothesis, does not necessarily involve such a consequence. Whether atoms may prove to exist or not, the law of combining weights is independent thereof.

Two problems arose from the discoveries of Dalton and Berzelius. The first was to determine as exactly as possible the correct numbers of the combining weights. The other was to determine the true ratio of the atomic weights. And which is the multiple one? Both questions have had most ample experimental investigation, and are now answered rather satisfactorily. The first question was a purely technical one; its answer depended upon analytical skill, and Berzelius in his time easily took the lead, his numbers being readily accepted by the continent of Europe. In England there was a certain hesitation at first, owing to Prout's assumption (see below) but when Turner, at the instigation of the British Association for the Advancement of Science, tested Berzelius's numbers and found them entirely in accordance with his own measurements, these numbers were universally accepted. But then a rather large error in one of Berzelius's numbers (for carbon) was discovered in 1841 by Dumas and Stas, and a kind of panic ensued. New determinations of the atomic weights were undertaken from all sides. The result was most satisfactory for Berzelius, for no other important error was discovered, and even Dumas remarked that repeating a determination by Berzelius only meant getting the same result, if one worked properly. In later times more exact measurements, corresponding to the increasing accuracy in analysis, were carried out by various workers, amongst

256
whom J. S. Stas distinguished himself. But even the classical work of Stas proved not to be entirely without error; for every period has its limit in accuracy, which extends slowly as science extends. In recent times American chemists have been especially prominent in work of this kind, and the determinations of E. W. Morley, T. W. Richards and G. P. Baxter rank among the first in this line of investigation.

During this work the question arose naturally: How far does the exactness of the law extend? It is well known that most natural laws are only approximations, owing to disturbing causes. Are there disturbing causes also with atomic weights? The answer is that as far as we know there are none. The law is still an exact one. But we must keep in mind that an absolute answer is never possible. Our exactness is in every case limited, and as long as the possible variations lie behind this limit, we cannot tell anything about them. In recent times H. Landolt has doubted and experimentally investigated the law of the conservation of weight.

Landolt's experiments were carried out in vessels of the shape of an inverted U, each branch holding one of the substances to react one on the other. Two vessels were prepared as equal as possible and hung on both sides of a most sensitive balance. Then the difference of weight was determined in the usual way by exchanging both the vessels on the balance. After this set of weighings one of the vessels was inverted and the chemical reaction between the contained substances was performed; then the double weighing was repeated. Finally also the second vessel was inverted and a third set of weightings taken. From blank experiments where the vessels were filled with substances which did not react one on the other, the maximum error was determined to 0.03 milligramme. The reactions experimented with were: silver salts with ferrous sulphate; iron on copper sulphate; gold chloride and ferrous chloride; hydrochloric acid and hydriodic acid; iodine and sulphur dioxide; uranyl nitrate and potassium hydrate; chloro hydrate and potassium hydrate; electrolysis of cadmium iodide by an alternating current; solution of ammonium chloride, potassium bromide and uranyl nitrate in water, and precipitation of an aqueous solution of copper sulphate by alcohol. In most of these experiments a slight diminution of weight was observed which exceeded the limit of error distinctly in two cases, viz. silver nitrate with ferrous sulphate and iodide with hydrochloric acid, the loss of weight amounting from 0.068 to 0.199 mg. with the first and 0.047 to 0.177 mg. with the second reaction on about 50 g. of substance. As each of these reactions had been tried in nine independent experiments, Landolt felt certain that there was no error of observation involved. "But when the vessels were covered inside with paraffin wax, no appreciable diminution of weight was observed."

These experiments apparently suggested a small decrease of weight as a consequence of chemical processes. On repeating them, however, and making allowance for the different amounts of water absorbed on the surface of the vessel at the beginning and end of the experiment, Landolt found in 1908 (Zeit. physik. Chem. 64, p. 581) that the variations in weight are equally positive and negative, and he concluded that there was no change in weight, at least to the extent of 1 part in 10,000,000.

There is still another question regarding the numerical values of the atomic weights, namely: Are there relations between the numbers belonging to the several elements? Richter had arranged his combining weights according to their magnitude, and endeavoured to prove that they form a certain mathematical series. He also explained the incompleteness of his series by assuming that certain acids or bases requisite to the filling up of the gaps in the series, were not yet known. He even had the satisfaction that in his time a new base was discovered, which fitted rather well into one of his gaps; but when it turned out afterwards that this new base was only calcium phosphate, this way of reasoning fell into discredit and was resumed only at a much later date.

To obtain a correct table of atomic weights the second question already mentioned, viz. how to select the correct value in the case of multiple proportions, had to be answered. Berzelius was constantly on the look-out for means to distinguish the true atomic weights from their multiples or sub-multiples, but he could not find an unmistakable test. The whole question fell into a terrible disorder, until in the middle of the 19th century S. Cannizzaro showed that by taking together all partial evidences one could get a system of atomic weights consistent in itself and fitting the exigencies of chemical systematics. Then a startling discovery was made by the same method which Richter had tried in vain, by arranging all atomic weights in one series according to their numerical values.

The Periodic Law.—The history of this discovery is rather long. As early as 1817 J. W. Dobereiner of Jena drew attention to the fact that the combining weight of strontium lies midway between those of calcium and barium, and some years later he showed that such "triax" occurred in other cases too. L. Gmelin tried to apply this idea to all elements, but he realized that in many cases more than three elements had to be grouped together. While Ernst Lennsen applied the idea of triads to the whole table of chemical elements, but without any important result, the other idea of grouping more than three elements into series according to their combining weights proved more successful. It was the concept of homologous series just developed in organic chemistry which influenced such considerations. First Max von Pettenkofer in 1859 and then J. B. A. Dumas in 1851 undertook to show that such a series of similar elements could be formed, having nearly constant differences between their combining weights. It is true that this idea in all its simplicity did not hold good extensively enough; so J. P. Cooke and Dumas tried more complicated types of numerical series, but only with a temporary success.

The idea of arranging all elements in a single series in the order of the magnitude of their combining weights, the germ of which is to be found already in J. B. Richter's work, appears first in 1860 in some tables published by Lothar Meyer for his lectures, Independently, A. E. de Chancourtois in 1862, J. A. R. Newlands in 1863, and D. I. Mendeleeff in 1869, developed the same idea with the same result, namely, that it is possible to divide this series of all the elements into a certain number of very similar parts. In their papers, which appeared in the same year, 1860, Lothar* Meyer and Mendeleeff gave to all these trials the shape now generally adopted. They succeeded in proving beyond all doubt that this series was of a periodic character, and could be cut into shorter pieces of similar construction. Here again gaps were present to be filled up by elements to be discovered, and Mendeleeff, who did this, predicted from the general regularity of his table the properties of such unknown elements. In this case fate was more kind than with Richter, and science had the satisfaction of seeing these predictions turn out to be true.

The following table contains this periodic arrangement of the elements according to their atomic weight. By cutting the whole series into pieces of eight elements (or more in several
of new work done for their determination. To avoid the uncertainty arising from this inevitable state of affairs, an international committee was formed by the cooperation of the leading chemical societies all over the world, and an international table of the most probable values is issued every year. The following table is that for 1910:

**International Atomic Weights, 1910.**

In the long and manifold development of the concept of the element one idea has remained prominent from the very beginning down to our times: it is the idea of a primordial matter. Since the naive statement of Thales that all things came from water, chemists could never reconcile themselves to the fact of the conservation of the elements. By an experimental investigation which extended over five centuries and more, the impossibility of transmuting one element into another—for example, lead into gold—was demonstrated in the most extended way, and nevertheless this law has so little entered the consciousness of the chemists that it is seldom explicitly stated even in carefully written text-books. On the other side the attempts to reduce the manifoldness of the actual chemical elements to one single primordial matter have never ceased, and the latest development of science seems to endorse such a view. It is therefore necessary to consider this question from a most general standpoint.

In physical science, the chemical elements may be compared with such concepts as mass, momentum, quantity of electricity, entropy and such like. While mass and entropy are determined univocally by a unit and a number, quantity of electricity has a unit, a number and a sign, for it can be positive as well as negative. Momentum has a unit, a number and a direction in space. Elements do not have a common unit as the former magnitudes, but every element has its own unit, and there is no transition from one to another. All these magnitudes underlie a law of conservation, but to a very different degree. While mass was...
considered as absolutely invariable in the classical mechanics, the newer theories of the electrical constitution of matter make mass dependent on the velocity of the moving electron. Momentum also is not entirely conservative because it can be changed by light-pressure. Entropy is known as constantly increasing, remaining constant only in an ideal limiting case. With chemical elements we observe the same thing as with momentum; though till recently considered as conservative, there is now experimental evidence that they do not always show this character.

Generally the laws of the conservation of mass, weight and elements are expressed as the "law of the conservation of matter." But this expression lacks scientific exactness because the term "matter" is generally not defined exactly, and because only the above-named properties of ponderable objects do not change, while all other properties do to a greater or less extent. Considered in the most general way, we may define matter as a complex of gravitational, kinetic and chemical energies, which are found to cling together in the same space. Of these energies the capacity factors, namely, weight and mass, and elements, are conservative as described, while the intensity factors, potential, velocity and affinity, may change in wide limits. To explain why we find these energies constantly combined one with another, we only have to think of a mass without gravity, a ponderable body without mass. The qualities could not move on earth by mere movement would carry it into infinite space, and the second would acquire infinite velocity by the slightest push and would also disappear at once. Therefore only such objects which have both mass and weight can be handled and can be objects of our knowledge. In the same way all other energies come to our knowledge only by being (at least temporarily) associated with this combination of mass and weight. This is the true meaning of the term "matter."

In this line of ideas matter appears not at all as a primary concept, but as a complex one; there is therefore no reason to consider matter as the last term of scientific analysis of chemical facts, and the idea of a primordial matter appears as a survival from the very first beginning of European natural philosophy. The most general concept science has developed to express the variety of experience is energy, and in terms of energy (combined with number, magnitudes, time and space) all observed and observable experiences are to be described. (W. O.)

**ELEMI**, an oleo-resin (Manilla elemi) obtained in the Philippine Islands, probably from *Canarium commune* (nat. ord. Bursaraceae) which when dried is a hard and granular substance of honey-like consistency, but which gradually hardens with age. It is soluble in alcohol and ether, and has a spicy taste with a smell like fennel. In the 17th and 18th centuries the term elemi usually denoted an oleo-resin (American or Brazilian elemi) obtained from trees of the genus *Icica* in Brazil, and still earlier it meant oriental or African elemi, derived from *Boswellia Frereana*, which flourishes in the neighbourhood of Cape Gardafui. The word, like the older term *animi*, appears to have been derived from *enkaemon* (Gr. *evaimos*), the name of a styptic medicine said by Pliny to contain tears exuded by the olive tree of Arabia.

**ELEPHANT**, the designation of the two existing representatives of the Proboscidea, a sub-order of ungulate mammals, and also extended to include their more immediate extinct relatives. As the distinctive characteristics of the sub-order, and also of the single existing genus *Elephas*, are given in the article *Proboscidea*, it will suffice to point out how the two existing species are distinguished from one another.

The more specialized of the two species is the Indian or Asiatic elephant, *Elephas maximus*, specially characterized by the extreme complexity of the structure of its molar teeth, which are composed of a great number of tall and thin plates of enamel and dentine, with the intervals filled by cement (see *Proboscidea*, fig. 1). The average number of plates of the six successive molar teeth may be expressed by the "ridge-formula" 4, 8, 12, 12, 16, 24. The plates are compressed from before backwards, the anterior and posterior surfaces (as seen in the worn grinding face of the tooth) being nearly parallel. Ears of moderate size. Upper margin of the end of the proboscis developed into a distinct finger-like process, much longer than the lower margins, and the whole trunk uniformly tapering and smooth. Five nails on the fore-feet, and four (occasionally five) on the hind-feet.

The Asiatic elephant inhabits the forest-lands of India, Burma, the Malay Peninsula, Cochin China, Ceylon and Sumatra. Elephants from the last-named islands present some variations from those of the mainland, and have been separated under the names of *E. sylonicus* and *E. sumatratus*, but they are not more than local races, and the Ceylon animal, which is generally tuskless, may be the typical *E. maximus*. In which case the Indian race will be *E. maximus indicus*. The appearance of the Asiatic elephant is familiar to all. In the wild state it is gregarious, associating in herds of ten, twenty or more individuals, and, though it may under certain circumstances become dangerous, it is generally inoffensive and even timid, fond of shade and solitude and the neighbourhood of water. The height of the male at the shoulder when full grown is usually from 8 to 10 ft., occasionally as much as 11, and possibly even more. The female is somewhat smaller.

The following epitome of the habits of the Asiatic elephants is extracted from Great and Small Game of India and Tibet, by R. Lydekker:

"The structure of the teeth is sufficient to indicate that the food consists chiefly of grass, leaves, succulent shoots and fruits; and this has been found by observation to be actually the case. In this respect the Asiatic species differs very widely from its African relative, whose nutrient is largely composed of boughs and roots. Another difference between the two animals is to be found in the great intolerance of the direct rays of the sun displayed by the Asian species, which never voluntarily exposes itself to the sun. Consequently, during the hot season in Upper India, and at all times except during the rains in the more southern districts, elephants keep much to the denser parts of the forests. In Southern India they delight in hill-forest, where the undergrowth is largely formed of bamboo, the tender shoots of which form a favourite delicacy; but during the rains they venture out to feed on the open grass tracts. Water is everywhere essential to their well-being; and no animals delight more thoroughly in a bath. Nor are they afraid to venture out of their depth, being excellent swimmers, and able, by means of their trunks, to breathe without difficulty when the entire body is submerged. The herds, which are led by females, appear in general to be family parties; and although commonly restricted to from thirty to fifty, may occasionally include as many as one hundred head. The old bulls are very generally solitary for a considerable portion of the year, but return to the herds during the pairing season. Some 'rogue' elephants—gunda of the natives—remain, however, permanently separated from the rest of their kind. All such solitary bulls, as their colloquial name indicates, are of a spoilful disposition; and it appears that with the majority the inducement to live apart is due to their partiality for cultivated crops, into which the more timid females are afraid to venture. 'Must' elephants are males in a condition of—probably sexual—excitement, when an abundant discharge of dark oily matter exudes from two pores in the forehead. In addition to various sounds produced at other times, an elephant when about to charge gives vent to a shrill loud 'trumpet'; and on such occasions rushes on its
adversary with its trunk safely rolled up out of danger, endeavouring either to pin him to the ground with its tusks (if a male tusker); or to trample him to death beneath its ponderous knees or feet."

Exact information in regard to the period of gestation of the female is still lacking, the length of the period being given from eighteen to twenty-two months by different authorities. The native idea, which may be true, is that the shorter period occurs in the case of the female and the longer in that of male calves. In India, elephants seldom breed in captivity, though they do so more frequently in Burma and Siam; the domesticated stock is therefore replenished by fresh captures. Occasionally two calves are produced at a birth, although the normal number is one. Calves suckle with their mouths and not with their trunks. Unlike the African species, the Indian elephant charges with its trunk curled up, and consequently in silence.

As regards their present distribution in India, elephants are found along the foot of the Himalaya as far west as the valley of Dehra-Dun, where the winter temperature falls to a comparatively low point. A favourite haunt used to be the swamp of Azufghur, lying among the sal-forests to the northward of Meerut. In the great tract of forest between the Ganges and Kistna rivers they occur locally as far west as Bilaspur and Mandla; they are met with in the Western Ghats as far north as between latitude 17° and 18°, and are likewise found in the hill-

forests of Mysore, as well as still farther south. In this part of the peninsula they ascend the hills to a considerable height, as they do in the Newara Eilya district of Ceylon, where they have been encountered at an elevation of over 7000 ft. There is evidence that about three centuries ago elephants wandered in the forests of Mulwa and Nimar, while they survived to a later date in the Chanda district of the Central Provinces. At the comparatively remote epoch when the Deccan was a forest tract, they were probably also met with there, but the swamps of the Bengal Sundarbans appear unsuited to their habits.

Of tusks, the three longest specimens on record respectively measure 8 ft. 9 in., 8 ft. 2 in. and 8 ft.; their respective weights being 81, 80 and 60 lb. These are, however, by no means the heaviest—one, whose length is 7 ft. 33 in., weighing 102 lb; while a second, of which the length is 7 ft. 33 in., scaled 97½ lb. Of the largest pair in the possession of the British Museum, which belonged to an elephant killed in 1866 by Colonel G. M. Payne in Madras, one tusk measures 6 ft. 8 in. in length, and weighs 77½ lb, the other being somewhat smaller. It should be added that some of these large tusks came from Ceylon; such tuskers being believed to be descended from mainland animals imported into the island. "White" elephants are partial or complete albino, and are far from uncommon in Burma and Siam. Young Indian elephants are hairy, thus showing affinity with the mammoth.

The African elephant is a very different animal from its Asiatic cousin, both as regards structure and habits; and were it not for the existence of intermediate extinct species, might well be regarded as the representative of a distinct genus. Among its characteristics the following points are noticeable. The molar teeth are of coarse construction, with fewer and larger plates and thicker enamel; the ridge-formula being 3, 6, 7, 7, 10; while the plates are not flattened, but thicker in the middle than at the edges, so that their worn grinding-surfaces are lozenge-shaped. Ears very large. The upper and lower margins of the end of the trunk form two nearly equal prehensile lips. Only three toes on the hind-foot. A very important distinction is to be found in the conformation of the trunk, which, as shown in fig. 2, looks as though composed of a number of segments, gradually decreasing in size from base to tip like the joints of a telescope, instead of tapering gradually and evenly from one extremity to the other. The females have relatively large tusks, which are essential in obtaining their food. Except where exterminated by human agency (and this has been accomplished to a deplorable extent), the African elephant is a native of the wooded districts of the whole of Africa south of the Sahara. It is hunted chiefly for the sake of the ivory of its immense tusks, of which it yields the principal source of supply to the European market, and the desire to obtain which is rapidly leading to the extermination of the species. In size the male African elephant often surpasses the Asiatic species, reaching nearly 12 ft. in some cases. The circumference of the fore-foot is half the height at the shoulder, a circumstance which enables sportsmen to estimate approximately the size of their quarry. A tusk in the British Museum measures 10 ft. 2 in. in length, with a basal girth of 24 in. and a weight of 262½ lb; but a still longer, although lighter, tusk was brought to London in 1905.

Several local races of African elephant have been described, mainly distinguished from one another by the form and size of the ears, shape of the head, &c. The most interesting of these is the pigmy Congo race, *E. africanus pumilio*, named on the occurrence of an immature specimen in the possession of C. Hagenbeck, the well-known animal dealer of Hamburg. According to Hagenbeck’s estimate, this elephant, which came from the French Congo, was about six years old at the time it came under scientific notice. Moreover, in the opinion of the same observer, it is in no wise an abnormally dwarfed or ill-grown representative of the normal type of African elephant, but a well-developed adolescent animal. In height it stood about the same as a young individual of the ordinary African elephant when about a year and a half old, the vertical measurement at the shoulder being only 4 ft., or merely a foot higher than a new-born Indian elephant. Hagenbeck’s estimate of its age was based on the presence of well-developed tusks, and the relative proportion of the fore and hind limbs, which are stated to show considerable differences in the case of the African elephant according to age. Nothing was stated as to the probability of an increase in the stature of the French Congo animal with growth; but even if not another foot, its height would be considerably less than half that of a large Central African bull of the ordinary elephant.

By Dr Paul Matschi's several races of the African elephant have been described, mainly, as already mentioned, on certain differences in the shape of the ear. From the two West African races (*E. a. cylotis* and *E. a. axotis*) the dwarf Congo elephant is stated to be distinguished by the shape of its ear; comparison in at least one instance having been made with an immature animal. The relatively small size of the ear is one of the most distinctive characteristics of the dwarf race. Further, the skin is stated to be much rougher, with fewer cracks, while a more importance difference occurs in the trunk, which lacks the transverse ridges so distinctive of the ordinary African elephant, and thereby approximates to the Asiatic species.

If the differences in stature and form are constant, there can be no question as to the right of the dwarf Congo elephant to rank as a well-marked local race; the only point for consideration being whether it should not be called a species. The great interest in connexion with a dwarf West African race of elephant is in relation to the fossil pigmy elephants of the limestone
fissures and caves of Malta and Cyprus. Although some of these elephants are believed not to have been larger than donkeys, the height of others may be estimated at from 4 to 5 ft., or practically the same as that of the dwarf Congo race. By their describers, the dwarf European elephants were regarded as distinct species, under the names of *Elephas melitensis*, *E. mnaidiensis* and *E. cypriotis*; but since their molar teeth are essentially miniatures of those of the African elephant, it has been suggested by later observers that these animals are nothing more than dwarf races of the latter. This view may receive some support from the occurrence of a dwarf form of the African elephant in the Congo; and if we regard the latter as a subspecies of *Elephas africanus*, it seems highly probable that a similar position will have to be assigned to the pigmy European fossil elephants. If, on the other hand, the dwarf Congo elephant be regarded as a species, then the Maltese and Cyprian elephants may have to be classed as races of *Elephas pumilio*; or, rather, *E. pumilio* will have to rank as a race of the Maltese species. In this connexion it is of interest to note that, both in the Mediterranean islands and in West Africa, dwarf elephants of the African type are accompanied by pigmy species of hippopotamus, although we have yet evidence to show that in Africa the two animals occupy actually the same area. Still, the close relationship of the Pigmy Liberi, the pigmy hippopotamus to the fossil Mediterranean species is significant, in relation to the foregoing observations on the elephant.

It may be added that fossil remains of the African elephant have been obtained from Spain, Sicily, Algeria and Egypt, in strata of the Pleistocene age. Some of the main differences in the habits of the African as distinct from those of the Asiatic elephant have been mentioned under the heading of the latter species. The most important of these are the greater tolerance by the African animal of sunlight, and the hard nature of its food, which consists chiefly of boughs and roots. The latter are dug up with the tusks; the left one being generally employed in this service, and thus becoming much more worn than its fellow.

**ELEPHANTA ISLE** (called by the natives *Gharapuri*), a small island between Bombay and the mainland of India, situated about 6 m. from Bombay. It is nearly 5 m. in circumference, and the few inhabitants it contains are employed in the cultivation of rice, and in rearing sheep and poultry for the Bombay market. The island, though small, is highly picturesque, for it contains several springs of good water. There are also important quarries of building stone. But it owes its chief celebrity to the mythological excavations and sculptures of Hindu superstition which it contains. Opposite to the landing-place was a colossal statue of an elephant, cracked and mutilated, from which the island received from the Portuguese the name it still bears. The statue was removed in 1864, and may now be seen in the Victoria Gardens, Bombay. At a short distance from this spot is a cave, the entrance to which is nearly 60 ft. wide and 18 high, supported by pillars cut out of the rock; the sides are sculptured into numerous compartments, containing representations of the Hindu deities, but many of the figures have been defaced by the zeal of the Mahomedans and Portuguese. In the centre of the excavations is a remarkable *Trimurti* or bust, formerly thought to represent the Hindu Triad, namely, Brahma the Creator, Vishnu the Preserver, and Siva or Mahadeva the Destroyer, but now held to be a triform representation of Siva alone. The heads are from 4 to 5 ft. in length, and are well cut, and the faces, with the exception of the third, are of gigantic size. The hands are strongly curiously ornamented; and one of the figures holds in its hand a cobra, while on the cap are, amongst other symbols, a human skull and an infant. On each side of the *Trimurti* is a pilaster, the front of which is filled up by a human figure leaning on a dwarf, both much defaced. There is a large compartment to the right, hollowed a little, and covered with a great variety of figures, the largest of which is 16 ft. high, representing the double figure of Siva and Parvati, named Viraj, half male and half female. On the right is Brahma, four-faced, on a lotus—one of the very few representations of this god which now exist in India; and on the left is Vishnu. On the other side of the *Trimurti* is another compartment with various figures of Siva and Parvati, the most remarkable of which is Siva in his vindictive character, eight-handed, with a collet of skulls round his neck. On the right of the entrance to the cave is a square apartment, supported by eight colossal figures, containing a gigantic symbol of Mahadeva or Siva cut out of the rock. In a ravine connected with the great cave are two other caves, also containing sculptures, which, however, have been much defaced owing to the action of damp and the falling of the rocks; and in another hill is a fourth cave. This interesting retreat of Hindu religious art is said to have been dedicated to Siva, but it contains numerous representations of other Hindu deities. It has, however, for long been a place not so much of worship as of archaeological and artistic interest alike to the European and Hindu traveller. It forms a wonderful monument of antiquity, and must have been a work of incredible labour. Archaeological authorities are of opinion that the cave must have been excavated about the 10th century of the Christian era, if not earlier. The island is much frequented by the British residents of Bombay; and during his tour in India in 1875 King Edward VII., then prince of Wales, was entertained there by the Governor-General of India.

**ELEPHANTIASIS** (Bartholomei, *Boucomeni*), is a disease dependent on chronic lymphatic obstruction, and characterized by hypertrophy of the skin and subcutaneous tissue. Two distinct forms are known, (1) *elephantiasis araba*, due to the development of living parasites, *filaria sanguinis hominis* (or *filaria Bancrofti*), and (2) the non-filarial form due to lymphatic obstruction from any other cause whatever, as erysipelas, the deposit of tuberculous or cancerous material in the lymphatic glands, phlegmasia dolens (white leg), long-continued eczema, &c. The enlargement is limited to a particular part of the body, generally one, or in rare cases both of the lower limbs, occasionally the scrotum, one of the labiae or the mammary gland; far more rarely the face. An attack is usually ushered in by febrile disturbance (elephantoid fever), the part attacked becoming rapidly swollen, and the skin tense and red as in erysipelas. The subcutaneous tissues become firm, infiltrated and hard, pitting only on considerable pressure. The skin becomes roughened with a network of dilated lymphatics, and vesicles and bullae may form, discharging a chyle-like fluid when broken (lymphocele). There is much thickening of the subcutaneous tissue, and a feeling of hardness and wart-like, and there is a great tendency for varicose ulcers to form. At the end of a variable time enlargement ceases to take place, and the disease enters a quiescent stage; but recurrences occur at irregular intervals, always ushered in by elephantoid fever. At the end of some years the attacks of fever cease, and the affected part remains permanently swollen. The only difference in the history of the two forms of the disease lies in the fact that the non-filarial form progresses steadily, until either the underlying condition is cured, or in the case of cancer, &c., brings about a fatal issue. The *elephantiasis* due to filaria is spread by the agency of mosquitoes, in whose bodies the intermediate stage is passed. The dead mosquito falls upon the water, which thus becomes infected, and hence the ova reach the human stomach. The young worm develops, bores through the gastric mucous membrane and finally becomes lodged in the lymphatics, usually of one or other of the extremities. A large number of embryonic filariae are produced. Some remain in the lymphatic spaces and cause lymphatic obstruction, while others enter the blood stream by night (filaria nocturna), or by day (filaria diurna). It is supposed that this latter type, biting an infected person, itself becomes infected with the blood it abstracts, and that so a new generation is developed.

Treatment for this condition is unsatisfactory. Occasionally the dilated lymph trunks can be found, and an operation performed to implant them in some vein (lymphangioplasty). And in some few other cases artificial lymphatics have been made by introducing sterilized silk thread in the subcutaneous tissues of the affected part, and prolonging it into the normal tissue. This operation has been most successful when performed on
elephantoid arms dependent on a late stage of cancerous breast. Elevation of the limb and elastic pressure should always be tried, but often amputation has to be resorted to in the end. The disease is totally different from the so-called elephantiasis gracorum or true leprosy, for which see LEPROSY.

ELEPHANT'S-FOOT, the popular name for the plant Testudinaria elephantipes, a native of the Cape of Good Hope. It takes its name from the large tuberous stem, which grows very slowly but often reaches a considerable size, e.g. more than 3 yds. in circumference with a height of nearly 3 ft. above ground. It is rich in starch, whence the name Hottentot bread, and is covered on the outside with thick, hard, corky plates. It develops slender, leafy, climbing shoots which die down each season. It is a member of the monocotyledonous order Dioscoreaceae, half of the 17th century, when it became a centre for the trade with south Russia.

ELEUSIS, an ancient Greek city in Attica about 14 m. N.W. of Athens, occupying the eastern part of a rocky ridge close to the shore opposite the island of Salamis. Its fame is due chiefly to its Mysteries, for which see MYSTERY. Tradition carries back the origin of Eleusis to the highest antiquity. In the earlier period of its history it seems to have been an independent rival of Athens, and it was afterwards reckoned one of the twelve Old Attic cities. A considerable portion of its small territory was occupied by the plains of Thria, noticeable for their fertility, though the hopes of the husbandmen were not unfrequently disappointed by the blight of the south wind. To the west was the Πέλοψ Ράμων or Rharian Plain, where Demeter is said to

climbing plants with slender herbaceous or shrubby shoots, to which belong the yam and the British black bryony, Tamus communis.

ELETS, a town of Russia, in the government of Orel, 122 m. by rail E.S.E. of Orel, on the railway which connects Riga with Tsarskisyn on the lower Volga. Pop. (1883) 36,680; (1900) 38,239. Owing to its advantageous position Elets has grown rapidly. Its merchants buy large quantities of grain, and numerous flour-mills, many of them driven by steam, prepare flour, which is forwarded to Moscow and Riga. The trade in cattle is very important. Elets has the first grain elevator erected in Russia (1887), a railway school, and important tanneries, foundries for cast iron and copper, tallow-melting works, limekilns and brickworks. The cathedral and two monasteries contain venerated historic relics.

Elets is first mentioned in 1147, when it was a fort of Ryazan. The Turkish Polovtsi or Kumans attacked it in the 13th century, and the Mongols destroyed it during their first invasion (1239) and again in 1305. The Tatars plundered it in 1415 and 1455; and it seems to have been completely abandoned in the latter half of the 15th century. Its development dates from the second
Roman pavement, the curb surrounding an early well. This is almost certainly the καλλίχωρον φωσις mentioned by Pausanias. The Propylaia is a structure of Roman imperial date, in close imitation of the Propylaea on the Athenian Acropolis. It is, however, set in a wall of 6th-century work, though repaired in later times. This wall encloses a sort of outer court, of irregular triangular shape. The Small Propylaea is not set exactly opposite to the Great Propylaea, but at an angle to it; an inscription on the architrave records that it was built by Appius Claudius Pulcher, the contemporary of Cicero. It is also set in a later wall that occupies approximately the same position as two earlier ones, which date from the 6th and 5th centuries respectively, and must have indicated the boundary of the inner precinct. From the Small Propylaea a paved road of Roman date leads to one of the doors of the Telesterion. Above the Small Propylaea, partly set beneath the overhanging rock, is the precinct of Pluto; it has a curious natural cleft approached by rock-cut steps. Several inscriptions and other antiquities were found here, including the famous head, now in Athens, usually called Euboules, though the evidence for its identification is far from satisfactory. A little farther on is a rock-cut platform, with a well, approached by a broad flight of steps, which probably served for spectators of the sacred procession. Beyond this, close to the side of the Telesterion, are the foundations of a temple on higher ground; it has been conjectured that this was the temple of Demeter, but there is no evidence that such a building existed in historic times, apart from the Telesterion. The Telesterion, or Hall of Initiation, was a large covered building, about 170 ft. square. It was surrounded on all sides by steps, which must have served as seats for the mystae, while the sacred dramas and processions took place on the floor of the hall; these steps were partly built up, partly cut in the solid rock; in later times they appear to have been covered with marble. There were two doors on each side of the hall, except the north-west, where it cut off the solid rock, and a rock terrace at a higher level adjoins it; this terrace may have been the station of those who were not yet admitted to the full initiation. The roof of the hall was carried by rows of columns, which were more than once renewed.

The architectural history of the hall has been traced by Professor W. Dörpfeld with the help of the various foundations that have been brought to light. The earliest building on the site is a small rectangular structure, with walls of polygonal masonry, built of the rock quarried on the spot. This was succeeded by a square hall, almost of the same plan as the later Telesterion, but about a quarter of the size; its eastern corner coincides with that of the later building, and it appears to have had a portico in front like that which, in the later hall, was a later addition. Its roof was carried by columns, of which the bases can still be seen. This building has with great probability been assigned to the time of Peisistratus; it was destroyed by the Persians. Between this event and the erection of the present hall, which must be substantially the one designed by Ictinus in the time of Pericles, there must have been a restoration, of which we may see the remains in a set of round sinkings to carry columns, which occur only in the north-east part of the hall; a set of bases arranged on a different system occur in the south-west part, and it is difficult to see how these two systems could be reconciled unless there were some sort of partition between the two parts of the hall. Both sets were removed to make way for the later columns, of which the bases and some of the drums still remain. These later columns are shown, by inscriptions and other fragments built into their bases, to belong to later Roman times. At the eastern and southern corners of the hall of Ictinus are projecting masses of masonry, which were the foundation for a portico that was to be added; but perhaps they were only buttresses, intended to resist the thrust of the roof of this huge structure, which rested at its northern and western corners against the solid rock of the hill. On the south-east side the hall is faced with a portico, extending its whole width; the marble pavement of this portico is a most conspicuous feature of Eleusis at the present day. The portico was added to the hall by the architect Philo, under Demetrius of Phalerum, about the end of the 4th century B.C. It was never completed, for the fluting of its columns still remains unfinished.

The Telesterion took up the greater part of the sacred precinct, which seems merely to have served to keep the profane away from the temple. The massive walls and towers of the time of Pericles, which resemble those of a fortress, are quite close in on the south and east; later, probably in the 4th century B.C., the precinct was extended farther to the south, and at its end was erected a building of considerable extent, including a curious apsidal chamber, for which a similar but larger curved structure was substituted in Roman times. This was probably the Bouleuterion. The precinct was full of altars, dedications and inscriptions; and many fragments of sculptures, pottery and other antiquities, from the earliest to the latest days of Greece, have been discovered. It is to be noted that the subterranean passages which some earlier explorers imagined to be connected with the celebration of the mysteries, have proved to be nothing but cisterns or watercourses.

The excavations of Eleusis, and the antiquities found in them, have been published from time to time in the Εξόρυξη Αρχαιοτήτων and in the Παλαιατζήκ of the Greek Archaeological Society, especially from 1863 onwards. See also D. Philibos, Eleusis, ses mystères, ses ruines, et son musée. Inscriptions have also been published in the Bulletin de correspondance hellénique. (E. Gr.)

ELEUTHERIUS, pope from about 175 to 189. Allusions to him are found in the letters of the martyrs of Lyons, cited by Eusebius, and in other documents of the time. The Liber Pontificalis, at the beginning of the 6th century, says that he had relations with a British king, Lucius, who was desirous of being converted to Christianity. This tradition—Roman, not British—is an enigma to critics, and, apparently, has no historical foundation.

ELEUTHEROPOLIS (Gr. Ἐλευθέριον πόλις, "free city"), an ancient city of Palestine, 25 m. from Jerusalem on the road to Gaza, identified by E. Robinson with the modern Beit Jibrin. This identification is confirmed by Roman milestones in the neighbourhood. It represents the Biblical Mareshah, the ruins of which exist at Tell Sandahanna close by. As Betogabra it is mentioned by Ptolemy; the name Eleutheropolis dates from the Syrian visit of Septimius Severus (A.D. 202). Eusebius in his Onomasticon uses it as a central point from which the distances of other towns are measured. It was destroyed in 796, rebuilt by the crusaders in 1134 (their fortress and chapel remain, much ruined). It was finally captured by the Seljuk Turks in 1244. Beit Jibrin is now in the centre of a district of great archaeological interest. Besides the crusader and other remains in the village itself, the surrounding country possesses many Tells (mounds) covering the sites of ancient cities. The famous caves of Beit Jibrin honeycomb the hills all round. These are immense artificial excavations of unknown date. Roman milestones and aqueducts also are found, and close by the now famous tomb of Apollon, with wall-paintings of animals and other ornamentation, was discovered in 1902; a description of it will be found in Thiersch and Peters, The Marissa Tombbs, published by the Palestine Exploration Fund. (R. A. S. M.)

ELEVATORS, LEFTS or HOSTS, machines for raising or lowering loads, whether of people or material, from one level to another. They are operated by steam, hydraulic or electric power, or, when small and light, by hand. Their construction varies with the magnitude of the work to be performed and the character of the motive power. In private houses, where only small weights, as coal, food, &c., have to be transferred from one floor to another, they usually consist simply of a small wooden or iron platform suspended from the roof of the upper floor by a tackle, the running part of which hangs from top to bottom and can be reached and operated at any level. In buildings where great weights and numbers of people have to be lifted, or a high speed of elevation is demanded, some form of motor is necessary. This is usually, directly or indirectly, a steam-engine or occasionally a gas-engine; sometimes a water-pressure engine is adopted, and it is becoming more and more common to employ an electric motor deriving its energy from
the general distribution of the city. Large establishments, hotels or business houses, commonly have their own source of energy, an electric or other power "plant," on the premises.

The hydraulic elevator is the simplest in construction of elevators proper, sometimes consisting merely of a long pipe set deeply in the ground under the cage and containing a correspondingly long plunger, which rises and falls as required and carries the elevator-cage on its upper end (fig. 1). The "stroke" is thus necessarily equal to the height traversed by the cage, with some surplus to keep the plunger steady within its guiding-pipe. The pipe or pump chamber has a length exceeding the maximum rise and fall of the plunger, and must be strong enough to sustain safely the heavy hydraulic pressures needed to raise plunger and cage with load. The power is usually supplied by a steam pump (occasionally by a hydraulic motor), which forces water into the chamber of the great pipe as the elevator rises, a waste-cock drawing off the liquid in the process of lowering the cage. A single handle within the cage generally serves to apply the pressure when raising, and to reduce it when lowering the load. The most common form of hydraulic elevator, for important work and under usual conditions of operation, as in cities, consists of a suspended cage, carried by a tackle, the running part of which...
is connected with a set of pulleys at each end of a frame (fig. 2). The rope is made fast at one end, and its intermediate part is carried round first one pulley at the farther end of the frame and then round another at the nearer end, and so on as often as is found advisable in the particular case. The two pulley shafts carrying these two sets of pulleys are made to traverse the frame in such a way as, by their separation, to haul in on the running part, or, by their approximation, to permit the weight of the cage to haul out the rope. By this alternate hauling and "rendering" of the rope the cage is raised and lowered. The use of a number of parallel and independent sets of pulleys and tackles assures safety in case of the breakage of any one, each being strong enough alone to hold the load. The movement of the pair of pulley shafts is effected by a water-pressure engine, actuating the plunger of a pump which is similar to that used in the preceding apparatus, but being relatively of short stroke and large diameter, is more satisfactory in design and construction as well as in operation. Electricity may be applied to elevators of this type by attaching the travelling sheaves to a nut in which works a screwed shaft driven by an electric motor. In other electric lifts the cables which support the elevator work on a drum which is turned by means of the drum being connected to the motor-shaft either by a series of pinions or by a worm-gear. The drum may also be worked by a steam or gas engine. Where the traffic is not very heavy, a form of elevator that requires no attendant is convenient. In this any one wishing to use the lift has merely to press a button placed by the side of the liftgate on the floor on which he happens to be standing, when the car shall come to him; and having entered it, he can cause it to travel to any floor he desires by pressing another button inside the car. The motive power in such cases may be either electric or hydraulic, but the control of the switches or valves that govern the action of the apparatus is electric.

The history of the elevator is chronologically extensive, but only since 1850 has rapid or important progress been effected. In that year George H. Fox & Co. built an elevator operated by the motion of a vertical screw, the nut on which carried the cage. This device was used in a number of instances especially in hotels in the large cities, during the succeeding twenty years, and was then generally supplanted by the hydraulic lift of the kind already described as the plunger-lift. With the increased demand for power, speed, safety, convenience of manipulation, and comfort in operation, the inventive ability of the engineer developed the various systems more and more perfectly, and experience gradually showed to what service each type was best adapted and the best construction of each for its peculiar work. Whatever the class, the following are the essentials of design, construction and operation: the elevator must be safe, comfortable, speedy and convenient, must not be too expensive in either first cost or maintenance, and must be absolutely trustworthy. It must not be liable to fracture of any element of the hoisting gear that will permit either the fall of the cage or its projection by an over-weighted balance upwards against the top of its shaft. It must be possible to stop it, whether in regular working or in emergency, or when an accident occurs, with sufficient promptness, yet without endangering life or property, or even very seriously inconveniencing the passengers. Acceleration and retardation in starting and stopping must be smooth and easy, the stop must be capable of being made precisely where and when intended, and no danger must be incurred by the passengers from contact with running parts of the mechanism or with the walls and doors of the elevator shaft.

These requirements have been fully met in the later forms of elevator commonly employed for passenger service. Usual sizes range from loads of 1000 to 5000 lb with speeds of from 80 to 250 ft. a minute unloaded, and 75 to 200 ft. loaded, and a height of travel of from 50 to 200 ft. In some very tall buildings, as the Singer and Metropolitan buildings in New York, elevators have been installed having a maximum speed of 600 ft. a minute, with a rise of over 500 ft. Where electric motors are employed, their speed ranges from 600 and 700 revolutions per minute in the larger to 1000 and 1200 in the smaller sizes, corresponding to from 20 down to 4 or 5 h.p. Two or more counter-weights are employed, and from four to six suspension cables ensure as nearly as possible absolute safety. The electric elevators of the Central London railway are guaranteed to raise 17,000 lb 65 ft. in some of its shafts, in 30 secs. from start to stop. Over 100,000 ft. of 3-in. and 17,000 ft. of 4-in. steel rope are required for its 24 shafts, and each rope can carry from 16 to 22 tons without breaking. The steel used in the cables, of which there are four to six for each car and counter-weight, has a tensile strength of 85 to 90 tons per sq. in. of section. The maximum pull on each set of rope is assumed to be not over 9500 lb, the remainder of the load being taken by the counterbalance. Oil "dash-pots" or buffers, into which enter plungers attached to the bottom of the cage, prevent too sudden a stop in case of accidental, and safety-clutches with friction adjustments of ample power and fully tested before use give ample insurance against a fall even if all the cables should yield at once—an almost inconceivable contingency. The efficiency, i.e. the ratio of work performed to power expended, is the same, was in these elevators found by test to be between 70 and 75%.

Safety devices constitute perhaps the most important of the later improvements in elevator construction where passengers are carried. The simplest and, where practicable, most certain of them is the "air-cushion," a chamber into which the cage falls if detached or from any cause allowed to fall too rapidly to the bottom, compression of the air bringing it to rest without shock (fig. 3). This chamber must be perfectly air-tight, except in so far as a purposely arranged clearance around the sides, diminishing downwards and in well-established proportion, is adjusted to permit a "dash-pot" action and to prevent rebound. The air-cushion should be about one-tenth the depth of the elevator shaft; in high buildings it may be a well 20 or 30 ft. deep. The Empire building, in New York, is twenty stories in height, the total travel of the cage is 287 ft., and the air-cushion is 50 ft. deep, extending from the floor of the third storey to the bottom of the shaft. Sliding doors of great strength, and automatic in action, at the first and second floors, are the only openings. The shaft is tapered for some distance below the third floor, and then carried straight to the bottom. An inlet valve admits air freely as the cage rises, and an adjusted safety-valve provides against excess pressure. A "car," falling freely from the twentieth storey, was checked by this arrangement without injury to a basket of eggs placed on its floor. Other safety devices consist of catches under the floor or the sides of the shaft, holding out of engagement by the pull on the cables. But if the strain is suddenly relieved, as by breakage of a cable or accident to the engine or motor, they instantly fly into place and, engaging strong side-struts in the shaft, hold the car until it can be once more lifted by its cables. These operate well when the cables part at or near the car, but they are apt to fail if the break occurs on the opposite side of the carrying sheaves at the top of the shaft, since the friction and inertia of the mass of the cables may in that case be sufficient to hold the paws out of gear either entirely or until the headway is so great as to cause the smashing of all resistances when they do engage.

Another principle employed in safety arrangements is the
action of inertia of parts properly formed and attached. Any
dangerous acceleration of the cage causes the inertia of these
parts to produce a retardation relative to the car which throws
into action a brake or a catch, and thus controls the motion
within safe limits or breaks the fall. The hydraulic brake
has been used in this apparatus, as have mechanical and pneumatic
apparatus. This control of the speed of fall is most commonly
secured by the employment of a centrifugal or other governor
or regulator. The governor may be on the top of the cage and driven
by a stationary rope fixed between the top and bottom of
the shafts, or it may be placed at the top of the shaft and driven
by a rope travelling with the car. Its action is usually to trip
into service a set of spring grips or friction clutches, which,
as a rule, grasp the guides of the cage and by their immense
pressure and great resultant friction bring the cage to rest within
a safe limit of speed, time and distance. A coefficient of friction
of about 15% is assumed in their design, and this estimate is
confirmed by their operation. Pressures of 10 tons or more are
sometimes provided in these grips to ensure the friction required.
There are many different forms of safety device of these various
classes, each maker having his own. The importance of absolute
safety against a fall is so great that the best builders are not
satisfied with any one form or principle, but combine provisions
against every known danger, and often duplicate such precau-
tions against the most common accidents.

The “travelling staircase,” which may be classed among the
passenger elevators, usually consists of a staircase so constructed
that while the passenger is ascending it the whole structure is
also ascending at a predetermined rate, so that the progress made
is the sum of the two rates of motion. The system of “treads and
risers” is carried on a long endless band of chain sustained by
guides holding it in its desired line, and rendering at either end
over cylinders or sprockets. The junctions between the stairway
and the upper or lower floors are ingeniously arranged so as to
avoid danger of injury to the passengers.

Freight elevators have the same general forms as the passenger
elevators, but are often vastly larger and more powerful, and
are not as a rule fitted up for such heights of lift, or constructed
with such elaborate provision for safety or with any special
finish. Elevators raising grain, coal, earth and similar materials,
such as can be taken up by scooping into a bucket, or can be run
into and out of the bucket by gravity, constitute a class by them-
elves, and are described in the article CONVEYORS.

The term “grain elevator” is often used to include buildings
as well as machinery, and it is not unusual in Europe to hear a
flour-mill, with its system of machinery, mills, elevator and
storage departments, spoken of as an “American elevator”
(see GRANARIES).

ELF (O. Eng. elf; cf. Ger. Alp, nightmare), a diminutive
supernatural being of Teutonic mythology, usually of a more or
less mischievous and malignant character, causing diseases and
evil dreams, stealing children and substituting changelings,
and thus somewhat different from the Romanic fairy, which
usually takes the form of a sinister ass or horse. The prehistoric
arrowheads and other flint implements were in England early known as
“elf-bolts” or “elf-arrows,” and were looked on as the weapons
of the elves, with which they injured cattle. So too a tangle
in the hair was called an “elf-lock,” as being caused by the mischief
of the elves.

ELGAR, SIR EDWARD (1857– ), English musical com-
poser, son of W. H. Elgar, who was for many years organist
in the Roman Catholic church of St George at Worcester, was born
there on the 2nd of June 1857. His father's connexion with
music at Worcester, with the Glee Club and with the Three
Choirs Festivals, supplied him with varied opportunities for a
musical education, and he learnt to play several instruments.
In 1879 he became bandmaster at the county lunatic asylum,
and held that post till 1883. He was also a member of an orchestra
at Birmingham, and in 1883 an internuncio by him was played
there at a concert. In 1882 he became conductor of the
Worcester Amateur Instrumental Society; and in 1885 he
succeeded his father as organist at St George’s, Worcester. There he
wrote a certain amount of church music. In 1890 he moved
to London, but finding no encouragement retired to Malvern in
1891; in 1904 he went to live at Hereford, and in 1905 was made
professor of music at Birmingham University. To the public
he was usually known as his oratorio _The Dream of
Gerontius_ was performed at Birmingham in 1900, but this was
at once received as a new revelation in English music, both at home
and by Richard Strauss in Germany, and the composer was made
a Mus. Doc. at Cambridge. His experience in writing church
music for a Roman Catholic service cannot be overlooked in
regard to this and other works by Elgar, who came to be regarded
as the representative of a Catholic or neo-Catholic style
of religious music, for which an appreciative public was ready
in England at the moment, owing to the recent developments in
the more artistic and sensuous side of the religious movement.
And the same interest attached to his later oratorios, _The Apostles_
(1905) and _The Kingdom_ (1906). But Elgar's sudden rise into
popularity, confirmed by his being knighted in 1904, drew
attention to his other productions. In 1896 his _Scenes from the
Sage of King Olaf_ was recognized by musicians as a fine work,
and in the same year his _Scenes from the Bavarian Highlands_
and _Lux Christi_ were performed; and apart from other important
compositions, his song-cycle _Sea-Pictures_ was sung at Norwich
in 1899 by Clara Butt, and his orchestral _Variations on an
original theme_ were given at a Richter concert in the same year.
In 1901 his popular march "Pomp and Circumstance" was
played at a promenade concert, the stirring melody of his song
"Land of Hope and Glory" being effectually utilized. It is
impossible here to enumerate all his works, which
have excited a good deal of criticism in musical circles without
impairing his general recognition as one of the few front-rank
English composers of his day; but his most important later
production, his first orchestral symphony, produced in 1908
with immediate success, raised his reputation as a composer to
an even higher place, as a work of marked power and beauty,
developing the symphonic form with the originality of a real
master of his art. In 1908 he resigned his professorship at
Birmingham University.

ELGIN, a city of Kane county, Illinois, U.S.A., in the N.
part of the state, 36 m. N.W. of Chicago. Pop. (1880) 8,787;
(1890) 17,823; (1900) 22,433, of whom 5,410 were foreign-born;
(1910 census) 25,976. Elgin is served by the Chicago & North-
Western and the Chicago, Milwaukee & St Paul railways, and by
interurban electric railways to Chicago, Aurora and Belvidere.
The city is the seat of the Northern Illinois hospital for the
insane, of the Elgin Academy (chartered 1839; opened 1856),
and of St Mary's Academy (Roman Catholic); and has the Gail
Borden public library, with 35,000 volumes in 1908. The city
has six public parks, Lord's Park containing 112, and Wing
Park 121 acres. The city is in a fine dairying region and is
an important market for butter. Among Elgin's manufactures
are watches and watch-cases, butter and other dairy products,
cooperage (especially butter tubs), canned corn, shiats, foundry
pipes, pipe-organ, and caskets and casket trimmings; in 1905 Elgin's total factory product was valued at
$6,340,274. The Elgin National Watch factory, and the Borden
milk-condensing works, are famous throughout the United States
and beyond. The publishing office of the Dunks, or German
Brethren, is at Elgin; and several popular weeklies with large
circulations are published here. A permanent settlement
was made as early as 1835, and Elgin was chartered as a city in 1854
and was rechartered in 1880.

ELGIN, a royal, municipal and police burgh, and county
town of Elginshire, Scotland, situated on the Lossie, 5 m. S.
of Lossiemouth its port, on the Moray Firth, and 714 m. N.W.
of Aberdeen, with stations on the Great North of Scotland and
Highland railways. Pop. (1901) 8,400. It is a place of very con-
siderable antiquity, was created a royal burgh by Alexander I.,
and received its charter from Alexander II. in 1254. Edward I.
went to the castle in 1296 and 1303, and it was said to be the
memory of his visit that the building was destroyed im-
mediately after national independence had been reasserted.
ELGIN AND KINCARDINE, EARLS OF

The hill on which it stood was renamed the Ladyhill, and on the scanty ruins of the castle now stands a monument to the 5th Duke of Gordon, consisting of a column supported by a tablet. The church has suffered periodically from fire, notably in 1452, when half of it was burnt by the earl of Huntly. Montrose plundered it twice in 1645. In 1746 Prince Charles Edward spent a few days in Thunderton House. His hostess, Mrs Anderson, an ardent Jacobite, kept the sheets in which he slept, and was buried in them on her death, twenty-five years afterwards. For fifty years after this date the place retained the character and traditions of a sleepy cathedral city, but with the approach of the 19th century it was touched by a more modern spirit. As the result much that was picturesque disappeared, but the prosperity of Elgin was increased, so that now, owing to its pleasant situation in "the Garden of Scotland," its healthy climate, cheap living, and excellent educational facilities, it has become a flourishing community. The centre of interest is the cathedral of Moray, which was founded in 1224, when the church of the Holy Trinity was converted to this use. It was partially burned in 1270 and almost destroyed in 1390 by Alexander Stewart, the Wolf of Badenoch, natural son of Robert II., who had incurred the censure of the Church. In 1402 Alexander, Lord of the Isles, set fire to the tower of the cathedral for a contempt of the Church, "for the memory of which the Little Cross (so called to distinguish it from the Muckle or Market Cross, restored in 1888) was erected. After these outrages it was practically rebuilt on a scale of grandeur that made it the most magnificent example of church architecture in the north. Its design was that of a Jerusalem cross, with two flanking towers at the east end, two at the west end, and one in the centre, at the intersection of the roofs of the nave and transepts. It measured 282 ft. long from east to west by 120 ft. across the transepts, and consisted of the choir, the gable of which was pierced by two tiers of five lancet windows and the Omega rose window; the north transept, in which the Dunbars were buried, and the south transept, the doorway of which is interesting for its dog's-tooth ornamentation; and the nave of five aisles. The grand entrance was by the richly carved west door, above which was the Alpha window. The central steeple fell in 1506, but was rebuilt, the new tower with its spire reaching a height of 198 ft. By 1538 the edifice was complete in every part. Though the Reformation left it unscathed, it suffered wanton violence from time to time, the spire being partly destroyed in 1617, the roofs in 1657 and sold to Holland to pay the troops, but the ship conveying the spoils founder on the North Sea. In 1657 the roof-tree of the choir perished during a gale, and three years later the rich timber screen was demolished. The central tower again collapsed in 1711, after which the edifice was allowed to go to ruin. Its stones were carted away, and the churchyard, overgrown with weeds, became the dumping-ground for rubbish. It lay thus scandalously neglected until 1824, when John Shanks, a "drouthy" cobbler, was appointed keeper. By a species of inspiration this man, hitherto a ne'er-do-well, conceived the notion of restoring the place to order. Undismayed, he attacked the mass of litter and with his own hands removed 3000 barrow-loads. When he died in 1841 he had cleared away all the rubbish, disclosed the original plan, and collected a quantity of fragments. A tablet, let into the wall, contains an epitaph by Lord Cockburn, recording Shanks's services to the venerable pile, which has since been entrusted to the custody of the commissioners of woods and forests. The chapter-house, the crypt, the twin-towered sacristy, the buildings, and contained a 'Prentice pillar, of which a similar story is told to that of the ornate column in Rosslyn chapel. In the lavatory, or vestibule connecting the chapter-house with the choir, Marjory Anderson, a poor half-crazy creature, a soldier's widow, took up her quarters in 1748. She cradled her son in the piscina and lived on charity. In the course of time the lad joined the army and went to India, where he rose to the rank of major-general and amassed a fortune of £70,000 with which he endowed the Elgin Institution (commonly known as the Anderson Institution) at the east end of High Street, for the education of youth and the support of old age. Within the precincts of the cathedral grounds stood the bishop's palace (now in ruins), the houses of the dean and archdeacon (now North and South Colleges), and the manses of the canons. Other ecclesiastical buildings were the monasteries of Blackfriars (1230) and Greyfriars (1410) and the preceptory of Maisondieu (1240). They also were permitted to fall into decay, but the 3rd marquess of Bute undertook the restoration of the Greyfriars' chapel. The parish church, in the Greek style, was built in 1828. Gray's hospital, at the west end of High Street, was endowed by Dr Alexander Gray (1751-1808), and at the east end stands the Institution, already mentioned, founded by General Andew Anderson (1746-1822). Other public buildings include the assembly rooms, the town-hall, the museum (in which the antiquities and natural history of the shire are abundantly illustrated), the district asylum, the academy, the county buildings and the court house, the market buildings, the Victoria school of science and art, and Lady Gordon-Cumming's children's home. In 1903 Mr G. A. Cooper presented his native town with a public park of 42 acres, containing lakes representing on a miniature scale the British Isles. Grant Lodge, an old mansion of the Graems family, occupying the south-west corner of the park, stands amid trees, and is now a residence. From the heights the view commands the links of the Lossie and the surrounding country, and a recreation ground is laid out on Lossie Green. The industries include distilling and brewing, nursery gardening, tanning, saw and flour mills, iron-foundries and manufactures of woolens, tweeds and plaiting, and the quarrying of sandstone. Elgin combines with Banff, Cullen, Inverurie, Kintore and Peterhead to return one member to parliament, and the town is controlled by a council with provost and bailies. Two miles and a half S. by W. of Elgin stands the church of Birnie, with the exception of the church at Mortlach in Banffshire probably the oldest place of public worship in Scotland still in use. It is not later than 1150 and, with its predecessor, was the cathedral of Moray during the rule of the first four bishops; the fourth bishop, Simon de Toey, an Englishman, was buried in its precincts in 1184. In the church is preserved an old Celtic altar-bell of hammered iron, known as the "Ronnell bell." Such is the odour of sanctity of this venerable church that there is an old local saying that "to be thrice prayed for in the kirk of Birnie will either mend or end ye." Six miles to the S.W. of Elgin is the island of Lorne, of which little is known; surrounded by fine sea cliffs, the isle is now occupied by a 21st century army, which he rose to the rank of general. His chief attention was, however, devoted to diplomacy. In 1792 he was appointed envoy at Brussels, and in 1793 envoy extraordinary at Berlin; and from 1799 to 1802 he was envoy extraordinary at the Porte. It was during his stay at Constantinople that he formed the purpose of removing from Athens the celebrated sculptures now known as the Elgin Marbles. His doing so was censured by some as vandalism, and doubts were also expressed as to the artistic value of many of the marbles; but he vindicated himself
ELGIN AND KINCARDINE, EARLS OF

in a pamphlet published in 1810, and entitled Memorandum on the Subject of the Earl of Elgin's Pursuits in Greece. In 1816 the collection was purchased by the nation for £36,000, and placed in the British Museum, the outlay incurred by Lord Elgin having been more than £50,000. Lord Elgin was a Scottish representative peer for fifty years. He died at Paris on the 14th of November 1841.

James Bruce, 8th earl of Elgin (1811-1863), British statesman, eldest son of the 7th earl by his second marriage, was born in 1811, and succeeded to the peerage as 8th earl of Elgin and 12th of Kincardine in 1841. He was educated at Eton and at Christ Church, Oxford, where he had as companions and rivals his younger predecessors in the office of governor-general of India, Dalhousie and Canning. He began his official career in 1842 at the age of thirty, as governor of Jamaica. During an administration of four years he succeeded in winning the respect of all classes. He improved the condition of the negroes and conciliated the planters by working through them. In 1846 Lord Grey appointed him governor-general of Canada. Son-in-law of the popular earl of Durham, he was well received by the colonists, and he set himself deliberately to carry out the Durham policy. In this his frank and genial manner aided him powerfully. His mission lost none of those who had suffered in the troubles of 1837 led the mob of Montreal to pelt his carriage for the reward of rebels for rebellion, as Mr Gladstone described it. But long before his eight years' term of service expired he was the most popular man in Canada. His relations with the United States, his hearty support of the self-government and defence of the colony, and his settlement of the free-trade and fishery questions, led to his being raised in 1849 to the British peerage as Baron Elgin.

Soon after his return to England in 1854, Lord Palmerston offered him a seat in the cabinet as chancellor of the duchy of Lancaster, which he declined. But when, in 1856, the seizure of the "Arrow" by Commissioner Yeh plunged England into war with China, he at once accepted the appointment of special envoy with the expedition. On reaching Point de Galle he was met by a force summoned from Bombay to Calcutta by the news of the sepoys mutiny at Meerut on the 12th of May. His first idea, that the somewhat meagre intelligence would justify most energetic action, was at once changed by the receipt of the urgent letters from Lord Canning reached him at Singapore, the next port, on the 3rd of June. H.M.S. "Shannon" was at once sent on to Calcutta with the troops destined for China, and Lord Elgin himself followed it, when gloomier letters from India reached him. The arrival of the "Shannon" gave new life to the handful of white men fighting for civilization against fearful odds, and before the reinforcements from England arrived the back of the mutiny had been broken. Nor was the position in China seriously affected by the want of the troops. Lord Elgin sent in his ultimatum to Commissioner Yeh at Canton on the same day, the 12th of December, that he learned the relief of Lucknow, and he soon after sent Yeh a prisoner to Calcutta. By July 1858, after months of Chinese deception, he was able to leave the Gulf of Pechili with the emperor's assent to the Treaty of Tientsin. Subsequently he visited Japan, and obtained less considerable concessions from its government in the Treaty of Yedo. It is true that the negotiations were confined to the really subordinate Tycoon of Shogun, but that visit proved the beginning of British influence in the most progressive country of Asia. Unfortunately, the Chinese difficulty was not yet at an end. After tedious disputes with the tariff commissioners as to the opium duty, and a visit to the upper waters of the Yang-tze, Lord Elgin had reached England in May 1859.

But when his brother and the allied forces attempted to proceed to Peking with the ratified treaty, they were fired on from the Taku forts at the mouth of the Peiho. The Chinese had resolved to try the fortune of war once more, and Lord Russell again sent out Lord Elgin as ambassador extraordinary to demand an apology for the attack, the execution of the treaty, and an indemnity for the military and naval expenditure. Sir Robert Napier (afterwards Lord Napier of Magdala) and Sir Hope Grant with the French, so effectually routed the Tatar troops and sacked the Summer Palace that by the 24th of October 1860 a convention was concluded which was "entirely satisfactory to Her Majesty's government." Lord Elgin had not been a month at home when Lord Palmerston selected him to be viceroy and governor-general of India. He had now attained the object of his honourable ambition, after the office had been filled in most critical times by his juniors and old college companions, the marquis of Dalhousie and Earl Canning. He succeeded a statesman who had done much to reorganize the whole administration of India, shattered as it had been by the mutiny. But, as the first viceroy directly appointed by the Crown, and as subject to the secretary of state for India, Lord Elgin at once gave up all Lord Canning had fought for, in the co-ordinate independence, or rather the stimulating responsibility, of the governor-general, which had prevailed from the days of Clive and Warren Hastings. On the other hand, he loyally carried out the wise and equitable policy of his predecessor towards our feudatories with a firmness and a dignity that in the case of Holkar and Udaipur had a good effect. He did his best to check the aggression of the Dutch in Sumatra, which was contrary to treaty, and he supported Dost Mahomed in Kabul until his elder son entered the then neutral and disputed territory of Herat. Determined to maintain inviolate the integrity of our own north-west frontier, Lord Elgin assembled a camp of exercise at Lahore, and marched a force to the Peshawar border to punish those branches of the Yusufzai tribe who had violated the engagements of 1858.

It was in the midst of this "little war" that he died. Soon after his arrival at Calcutta, he had projected the usual tour to Simla, to be followed by an inspection of the Punjab and its warlike ring-fence of Pathans. He even contemplated the summoning of the central legislative council at Lahore. After passing the summer of 1863 in the cool retreat of Peterhoff, Simla, Lord Elgin began a march across the hills from Simla to Sialkot by the upper valleys of the Beas, the Ravi and the Chenab, chiefly to decide the two allied questions of tea cultivation and trade routes to Kashgar and Tibet. The climbing up to the Rotung Pass (13,000 ft.), which separates the Beas valley from that of the Chenab, and the crossing of the frail twig bridge across the Chandra torrent, prostrated him by the time he had descended into the more sheltered valley. Henceforward he wrote his last letter to Sir Charles Wood, still full of hope and not free from anxiety as to the Sittana expedition. At the lovely hill station of Dharmasala, "the place of piety," he died of fatty degeneration of heart on the 20th of November 1863.

For his whole career see Letters and Journals of James, Eighth Earl of Elgin, edited by Wal rond, but corrected by his brother-in-law, Dean Stanley; for the China missions see Narrative of the Earl of Elgin's Mission to China and Japan, by Laurence Oliphant, his private secretary; for the brief Indian administration see the Friend of India for 1862-1863.

Victor Alexander Bruce, 9th earl of Elgin (1840- ), British statesman, was born on the 10th of May 1849, the son of the 8th earl, and was educated at Eton and Balliol College, Oxford. In 1863 he succeeded as 9th earl of Elgin and 13th of Kincardine. A Liberal in politics, he became first commissioner of works (1886), and subsequently viceroy of India (1894-1899). His administration in India was chiefly notable for the frontier wars of 1878-1880, and for the new viceroy's baton entered the then neutral and disputed territory of Herat. Determined to maintain inviolate the integrity of our own north-west frontier, Lord Elgin assembled a camp of exercise at Lahore, and marched a force to the Peshawar border to punish those branches of the Yusufzai tribe who had violated the engagements of 1858.

After his return to England he was nominated chairman of the royal commission to investigate the conduct of the South African War; and on the formation of Sir Henry Campbell-Bannerman's ministry in December 1905, he became a member of the cabinet as secretary of state for the colonies. In this capacity, though he showed many statesmanlike qualities, he was somewhat overshadowed by his brilliant under-secretary in the Commons, Mr Winston Churchill, whose speeches on colonial affairs were as aggressive as Lord Elgin's were cautious; and when in April 1908 Mr Asquith became prime minister, Lord Elgin retired from the cabinet.
ELGINSHIRE, or MORAY (Gaelic "among the sea-board men"), a northern county of Scotland, bounded N. by the Moray Firth, E. and S.E. by Banffshire, S. and S.W. by Inverness and W. by Nairnshire. It comprises only the eastern portion of the ancient province of Moray, which extended from the Spey to the Bannock Burn and from the Grampians to the sea, embracing an area of about 3,000 sq. m. The area of the county is 305,119 acres, or 472 sq. m.

Elginshire is naturally divided into two sections, the level and fertile coast and its hinterland—"the Leigl o' Moray," a tract 30 m. long by from 510 to 12 m. broad—and the hilly country in the south. There are, however, no high mountains. Carn Righ (1784 ft.), Lang Hill (1783 ft.) and Carn Kitty (1714 ft.) are the chief eminences in the south-central district until the ridge of the Cromdale Hills is reached on the Banffshire border, where the highest point is 2329 ft. above the sea. The two most important rivers, the Spey (95) and the Findhorn, both have their sources in Inverness-shire. About 50 m. of the course of the Spey are in Elginshire, to which it may be roughly said to serve as the boundary line on the south-east and east. The Findhorn rises in the Monadhlaich Mountains which form the watershed for several miles between it and the Spey. Of its total course of nearly 70 m. only the last 12 are in the county, where it separates the woods of Altyle from the Forest of Darnaway, before entering the Moray Firth in a bay on the north-eastern shore, which it has given its name. During the first 7 m. past Elgin the stream passes through some of the finest scenery in Scotland. It is marked by sudden risings, and in the memorable Moray flood of August 1829 wrought the highest havoc. Of other rivers the Lossie rises in the small lakes on the banks of Carn Kitty and pursues a very winding course of 34 m. till it reaches the Moray Firth: Ballintob Burn, Rothes Burn and Tulchan Burn are left-hand affluents of the Spey; the Dorboc and Divie, uniting their forces near Dunphail House, join the Findhorn at Relugas; and Muckle Water, a left-hand tributary of the Findhorn, comes from Nairnshire. The Spey and Findhorn are famous for salmon, but some of the smaller streams, too, afford good sport. The lochs are few and unimportant, among them being Loch Spynie, 23 m. N., and Loch-na-Bo, 4 m. S.E. of Elgin; Loch of Blairs, 24 m. S. of Forres; Loch Romach, 3 m. S. of Rafford; Loch Dallas, about 4 m. S.W. of Dallas, and Lochindorb in the S.W., 6 m. N.N.W. of Grantown. Loch Spynie was once a lake extending from the Firth to within 2 m. of Elgin and covering an area of over 2000 acres. Its shores were the haunt of a great variety of birds, and its waters were full of salmon, sea-trout and pike. But early in the 19th century it was resolved to reclaim the land, and the drainage works then undertaken reduced the beautiful loch to a swamp of some 120 acres.

Lochindorb is now the largest lake, being 2 m. in length and fully 1 m. wide. In the upper end, on an island believed to be artificial, stand the ruins of Lochindorb Castle, in the 14th century the stronghold of the Wolf of Badenoch, and afterwards successively the property of the earl of Moray, the Campbells of Caedor and the earl of Seafield. Sir Thomas Dick Lauderdale saw at Caedor Castle a massive iron gate which, according to tradition, Sir Donald Campbell of Caedor carried on his back from Lochindorb to Caedor, a distance of 13 m. In the southern half of the county, amongst the hills, are several glens, among them the Glen of Rothes, Glen Lossie, Glen Gheallaidh, Glen Tulchan and Glen Beag. Strathspey, though more of a valley than a glen, is remarkable for its extent and beauty.

Geology.—This county may be divided geologically into two areas, the hilly region to the south being composed of the crystalline schists of the Central Highlands and the fertile coast to the north of the old Stobo and Southcraigs Trias strata. In the Cromdale Hills in the south-east of the county the metamorphic series comprises schistose quartzite, quartz-schists, micaceous flagstones and mica-schists, which are granitic and holocrystalline, the dark laminae in some cases containing heavy residues such as limonite and zircon. The greater portion of the metamorphic area west of the Spey consists of granulitic quartz-biote-granulites and bands of muscovite-biote-schist belonging to the Moine series of the Geological Survey (see SCOTLAND: Geology). In certain areas these are permeated by granitic material in the form of thin strings, knots and veins. Excellent sections of these rocks are exposed in the Findhorn, the Divie and the tributaries of the Spey. Near Grantown there is a group locally developed, comprising crystalline limestone with tremolite, kyanite gneiss, muscovite-biote-schist and hornblende biote-schist. The general strike of the crystalline schists, save where there are local deflections, is north-east and south-west, and the general dip is to the south-east. Between Lochindorb and Grantown there is a narrow belt of the old granitic rocks, which is crossed by the outcrops of the Caledonides represented by the Cairnagorm granite. Within the county there are representatives of the middle and upper divisions of the Old Red Sandstone resting unconformably on the crystalline schists. The strata consist of the Middle and Upper Old Red Sandstones, shales, slates and sandstones, passing upwards into a thin zone of andesite lavas, indicating contemporaneous volcanic action. West of the Tynet Burn, in the Ladder and the Findhorn, the Old Red Sandstone rests directly on the metamorphic rocks. Even to the south of the main boundary of the upper division there are small outliers of that series resting on the crystalline schists. Hence there must be a discordance there, which appears to be the case in the county. The strata of the upper division consist of red, grey and yellow false-bedded sandstones with conglomerat bands, which are well seen in the Findhorn between Sliege and C oddal, where they are crossed by the river. In the vicinity of the town of Elgin are great sheets of red sandstone, quartz-biotite-granulites and layers of conglomerate; the local conglomerate consisting of red, grey and yellow sandstones and a peculiar cherty and calcareous band, known as the cherty rock of Stotfold. The sandstones are visible in quarries on the north slope of Quarry Wood, at Findrassie, on the road to the Margate and on the seashore between Burghead and Lossiemouth. They are invested with special interest on account of the remarkable series of reptilian remains obtained from them, comprising Stagonolepis, a crocodile allied to the modern caiman in form; Telerpeton (Dipnoi); Dinogastria and Geikia) and a horned reptile, Elginia mirabilis (see SCOTLAND: Geology). The palaeontological evidence points to the conclusion that these reptilian sandstones must belong in part to the Trias, indeed it is possible that the lower and middle Trias are represented by some of these sandstone layers. In the quarry of Elgin these reptilian beds rest directly on the sandstones containing Halopichius of Upper Old Red Sandstone age, so that the apparent conformability must be entirely deceptive. Within the area covered by the Trias west of Stotfold,flagstones appear, and further west, with fish scales of Upper Old Red age, where they form a low ridge protruding through the younger strata. Both the Upper Old Red and Triassic sandstones have been largely quarried for building purposes. On the shore at Lossiemouth a patch of white sandstones yielding fossils characteristic of Lower Oolite.

The glacial deposits distributed over the fertile plain of Moray and in the upland valleys of interest. The great masses of boulders were derived from Moray Firth in a north-easterly and south-easterly direction, which carried boulders of granite from Strath Nairn and augen gneiss from Easter Ross. In the Elgin district, boulders belonging to the lower and middle Lower Old Red Sandstone, the quartzite of the upper division and the upper division of the Old Red Sandstone in the Ladder were transported as gravel and on the surface of the ground. The largest transported mass occurs at Linksfield, where a succession of sandstones and shales rests on boulder clay and is covered by it, which from the fossils may be of Lower Old Red Sandstone age. It occurs in the Ladder and the Old Red Sandstone.
ELGINSHIRE

to the glens and straths under barley approximates that under oats. In the uplands, oats is the principal cereal. The breeding of live-stock is profitable, and some of the finest specimens of short-haired and polled cattle and of crosses between the two are bred. On the larger farms in the Laigh Leicester sheep are kept all the year round, but in the uplands the Blackfaced take their place. Large numbers of horses and pigs are also raised.

Other Industries.—Whisky is the chief product, and the numerous distilleries are usually busy. There are woollen mills at Elgin and elsewhere and chemical works at Forres and Burghead. Owing to the absence of coal what little mineral wealth there is (iron and lead) cannot be remuneratively worked. The sandstone quarries, yielding a building-stone of superior quality, are practically inexhaustible. The plantations mainly consist of larch and fir and, to a smaller extent, of oak. Much timber was once floated down the Spey and other rivers, but, since the increased facilities of carriage afforded by the railways, trees have been felled on a wider scale. Boat-building is carried on at Burghead, Lossiemouth and Kingst——so-called from the fact that a firm from Kingston-on-Hull laid down a yard there in 1784——while at Garmouth the fishing fleet lies up during the winter and is also repaired there. The Firth fisheries are of considerable value. The boats go out from Findhorn, Burghead, Hopeman and Lossiemouth, which are all furnished with safe harbours. Findhorn has been twice visited by calamities. The first village was overwhelmed by the drifting sands of Culbin, and the second was buried beneath the waves in 1791. Kingston harbour is tidal, exposed, and liable to interruption from a shifting bar. The deep sea fisheries comprise haddock, cod, ling and herring, and the Spey, Findhorn and Lossie yield large quantities of salmon.

The Great North of Scotland railway enters the shire in the S.E. from Craigellachie, whence a branch runs up the Spey to Boat of Garten in Inverness-shire, and in the N.E. from Port Gordon, running in both cases to Elgin, from which a branch line extends to Lossiemouth. The Highland railway traverses the western limits of the shire running almost due north to Forres, whence it turns westward to Nairn and eastward to Elgin. From the county town it runs to Aberdeen via Orbiston and Keith, with a branch to Fochabers from Orbiston.

Population and Government.—The population was 43,471 in 1891 and 44,800 in 1901, when 1895 persons spoke both Gaelic and English, and 2 spoke Gaelic only. The chief towns are Elgin (pop. in 1901, 8460), Forres (4313) and Lossiemouth (3904), to which may be added Rothie (1621), Grantown (2568) and Burghead (1531). In 1881 the population of Nairnshire the county returns one member to parliament. Elgin and Forres are royal burghs; the municipal and police burghs include Burghead, Elgin, Forres, Grantown, Lossiemouth, and Rothes. Elginshire is included in one sheriffdom with Inverness and Nairn, and there is a resident sheriff-substitute at Elgin. The county is under school-board jurisdiction, several of the schools earning grants for higher education. There are academies at Elgin and Fochabers and science and art and technical schools at Elgin and Grantown. The bulk of the "residue" grant is spent in subsidizing the agricultural department of Aberdeen University and the science schools and art and technical classes in the county.

History.—Moray, in the wider sense, was first peopled by Picts of the Gaelic branch of Celts, of whom relics are found in the stone circle at Viewfield and at many places in Nairnshire. Christianity, introduced under the auspices of Columba (from whose time the site of Burghead church has probably been occupied), flourished for a period until the Columban church was expelled in 1271 by King Nectan. Thereafter the district was given over to intermittent strife between the northern and southern Picts, which was ended by the crofters of Kenneth MacAlpine in 831, as one result of which the kingdom of Pictavia was superseded by the principality of Moravia. Still, settled order had not yet been secured, for the Norsemen raided the country first under Thorsten and then under two Sigurds. It was in the time of the second Sigurd that the Firth was fixed as the northern boundary of Moray. In spite of such interruptions as the battle of Toriness (Burghead) on the 14th of August 1040, in which Thorsten, earl of Orkney and Shetland, overthrew a strong force of Scots under King Duncan, the consolidation of the kingdom was being gradually accomplished. After Macbeth ascended the throne the Scandinavians held their hands. Though Macbeth and his fainéant successor, "daft" Lulach, were the only kings whom Moray gave to Scotland, the province never lacked for able, if headstrong, men, and it continued to enjoy home rule under its own marmar, or great steward (the equivalent of earl, the title that replaced it), until the dawn of the 12th century, when as an entity it ceased to exist. With a view to breaking up the power of the marmars David I. and his successors colonized the seaboard with settlers from other parts of the kingdom. Nevertheless, from time to time the clansmen and their chiefs descended from their fastnesses and plundered the Laigh, keeping the people for generations in a state of panic. Meanwhile, the Church had become a civilizing force. In 1107 Alexander had founded the see of Moray and the churches of Birnie, Kinmeddar and Spynie were in turn the cathedral of the early bishops, until in 1224 under the episcopate of Andrew Moray (de Moravia), the church of the Holy Trinity in Elgin was chosen for the cathedral. Another factor that drew them together was the struggle for independence. In his effort to stamp out Scottish nationality Edward I. came as far north as Elgin, where he stayed for four days in July 1296, and whence he issued his writ for the parliament at Berwick. Wallace, however, had no doughtier supporter than Sir Andrew Moray of Bothwell, and Bruce recognized the assistance he had received from the men of the north by erecting Moray into an earldom on the morrow of Bannockburn and bestowing it upon Thomas Randolph (see Moray, THOMAS RANDOLPH, EARL OF). Henceforward the history of the county resolved itself in the main into matters affecting the power of the Church and the ambitions of the Moray dynasties. The Church accepted the Reformation peacefully if not with gratitude. But there was strife between Covenanters and the adherents of Episcopacy until, prelay itself being abolished in 1689, the bishopric of Moray came to an end after an existence of 581 years. (For the subsequent history of the earldom, which was successively held by the Randolphs, the Dunbars, the Douglases, the royal Stewarts and an illegitimate branch of the Stewarts, see MURRAY OF MORAY, EARLS OF.) Other celebrated Moray families who played a more or less strenuous part in local politics were the Gordons, the Grant and the Duffs. Still, national affairs occasionally evoked interest in Moray. In the civil war Montrose ravaged the villages which stood for the Covenanters, but most of the great lairds shifted in their allegiance, and the mass of the people were quite indifferent to the declining fortunes of the Stewarts. Charles II. landed at Garmouth on the 3rd of July 1659 on his return from his first exile in Holland, but hurried southwards to try the yoke of Presbytery. The fight at Cromdale (May day, 1660) shattered the Jacobite cause, for the efforts in 1715 and 1745 were too spasmodic and half-hearted to affect the loyalty of the district to Hanoverian rule. A few weeks before Culloden Prince Charles Edward stayed in Elgin for some days, and a month afterwards the duke of Cumberland passed through the town at the top of his speed and administered the coup de grâce to the Young Pretender on Drumossie Moor.

Twice Elginshire has been the scene of catastrophes without parallel in Scotland. In 1694 the barony of Culbin—a fine estate, with a rent roll in money and kind of £500 a year, belonging to the Kinnairds, comprising 3600 acres of land, so fertile that it was called the Granary of Moray, a handsome mansion—a church and several houses—was buried under a mass of sand in a storm of extraordinary severity. The sandy waste measures 3 m. in length and 2 in breadth, and the sand, exceedingly fine and light, is constantly shifting and, at rare intervals, exposing traces of the vanished desmesne. This wilderness of dome-shaped dunes divided by a loftier ridge lies to the north-west of Forres.

The other calamity was the Moray floods of the 2nd and 3rd of
August 1820. The Findhorn rose 50 ft. above the ordinary level, inundating an area of 20 sq. m.; the Dvii rose 40 ft. and the Loosie flooded all the low ground around Elgin. The floods tore down bridges and buildings, and obliterated farms and home- steads.

Khind, Sketches of the Past and Present State of Moray (Edinburgh, 1839); E. Dunbar Dunbar, Documents relating to the Province of Moray (Edinburgh, 1895); C. A. Gordon, History of the House of Gordon (Aberdeen, 1890); C. Rampini, History of Moray and Nairn (Edinburgh, 1897); C. Innes, Elgin, Past and Present (Elgin, 1860); J. Macdonald, "Burnhead" (Proceedings of Glasgow Archaeological Soc.), (1891); Sir T. Dick Lauder, The Wolf of Badenoch (Glasgow, 1886); An Account of the Great Floods of August 1820 in the Province of Moray and Adjoining Districts (Edinburgh, 1821).

ELGON, also known as MASAWA, an extinct volcano in British East Africa, cut by c. N. and 34° E., forming a vast isolated mass over 40 m. in diameter. The outer slopes are in great measure precipitous on the north, west and south, but fall more gradually to the east. The southern cliffs are remarkable for extensive caves, which have the appearance of water-worn caves on a coast line and have for ages served as habitations for the natives. The higher parts slope gradually upwards to the rim of an old crater, lying somewhat north of the centre of the mass, and measuring some 8 m. in diameter. The highest point of the rim is about 14,100 ft. above the sea. Steep spurs separated by narrow ravines run out from the mountain, affording the most picturesque scenery. The ravines are traversed by a great number of streams, which flow north-west and west to the Nile through Lake Choga), south and south-east to Victoria Nyanza, and north-east to Lake Rudolf by the Turkwell, the head-stream of which rises within the crater, breaking through a deep cleft in its rim. To the north-west of the mountain a grassy plain, swampy at certain seasons, is held in by a ring of lakes ending in Choga, to the north-east the country becomes somewhat arid, while towards the south it is well wooded. The outer slopes are clothed in their upper regions with dense forest formed in part of bamboo, especially towards the south and west, in which directions the rainfall is greater than elsewhere. The lower slopes are exceptionally fertile on the west, and produce bananas in abundance. On the north-west and north the region between 6000 and 7000 ft. possesses a delightful climate, and is well watered by streams of ice-cold water. The district of Save on the north is a halting-place for Arab and Swahili caravans going north. On the west the slopes are densely inhabited by small Bantu-Negro tribes, who style their country Masawa (the alternative name for the mountain); but on the south and north there are tribes which seem akin to the Gallas. Of these, the best known are the El-gonyi, from whom the name Elgon has been derived. They formerly lived almost entirely in the caves, but many of them have descended to villages at the foot of the mountain.

Elgon was first visited in 1833 by Joseph Thomson, who brought to light the cave-dwellings on the southern face. It was crossed the trains from south toward its crater reached, in 1818, by the J. Janson and Erzen Gedge, while the first journey round it was made by C. W. Hobley in 1836. (E. H.)

ELI (Hebrew for “high” ? 1 Sam. chaps. I.-iv.), a member of the ancient priesthood founded in Egypt (1 Sam. ii. 27), priest of the temple of Shiloh, the sanctuary of the ark, and also “judge” over Israel. This was an unusual combination of offices, when it is considered that in the history preserved to us he appears in the weakness of extreme old age, unable to control the petulance and rapacity of his sons, Hophni and Phinehas, who disregarded the sanctuary and disgusted the people. While the central authority was thus weakened, the Philistines advanced against Israel, and gained a complete victory in the great battle of Ebenezer, where the ark was taken, and Hophni and Phinehas slain. Hearing the news Eli fell from his seat and died. In a passage not unlike the account of the birth of Benjamin (Gen. xxxv. 16 sq.), it is added that the wife of Phinehas, overwhelmed at the loss of the ark and her husband, died in child-birth, naming the babe Ichabod (1 Sam. iv. 19 sq.). This name, which popular etymology explained by the words “the glory is removed (or, stronger, ‘banished’) from Israel” (cf. Hos. x. 5), should perhaps be altered from i-k básó (as though “not glory”) to Jōchebed (Yōhebed, a slight change in the original), the name which tradition also gave to the mother of Moses (q.v.). After these events the sanctuary of Shiloh appears to have been destroyed (cf. Jer. vii. 12, xxxvi. 6, 9), and the descendants of Eli with the whole of their clan or “father’s house” subsequently appear as settled at Néc (1 Sam. xxi. 1, xxii. 11 sqq., cp. xiv. 3), perhaps in the immediate neighbourhood of Jerusalem (Is. x. 32). In the massacre of the clan by Saul, and the subsequent substitution of the survivor Abiathar by Zadok (1 Kings ii. 37, 38), later writers saw the fulfilment of the prophecies of judgment which was said to have been uttered in the days of Eli against his corrupt house (1 Sam. ii. 27 sqq., iii. 11 sqq.).

See further, Samuel, Books of; and on Eli as a descendant of a Levite clan (1 Sam. ii. 27 sqq.), see Levites (§ 3). W. R.S.; S. A.C.

ELIAS, of Cortona (c. 1180-1253), disciple of St Francis of Assisi, was born near Assisi, about 1180, of the working class, but became schoolmaster at Assisi and then notary at Bologna. In 1210 he was sent by the Franciscan mission to the Holy Land, and in 1210 St Francis made him first provincial minister of Syria. When St Francis was recalled from the East in 1220 he brought Elias with him. Elias played a leading part in the early history of the Franciscan order (see Franciscans); Francis made him his vicar general in 1221; and he was the practical acting superior of the order till Francis’s death in 1226, and the real superior till the general chapter of 1227. This chapter did not elect him minister general, but that of 1232 did; at the chapter of 1239 he was deposed. During these years he erected the basilica and monastery at Assisi which were entirely his creation—he collected the funds and carried the work through, being himself the builder and even the architect. Elias was a man of extraordinary ability, the friend both of Gregory IX. and of his opponent Frederick II. After his deposition Elias joined the party of the emperor and so incurred excommunication. Frederick sent him as ambassador to Constantinople. He dressed and lived as a Franciscan throughout and a small number of friars adhered to him; for these he built a church and monastery from which later efforts were made to bring about his reconciliation with the Holy See and the Church; at last on his death-bed he made his submission to the pope and died in 1253, having received the Sacraments.

The best account of Elias is that by Ed. Lempp, Frère Étie de Cortone (1901), who points out the conflict of view, as to the relations between Elias and Francis, between the Speculum perfectioem and the First Life, by Thomas of Celano; Lempp and Sabatier accept the hostile picture given by the Speculum perfectioem. But see further FRANCIS OF ASSISI, SAINT, “Note on Sources,” and especially the articles by Goeze, there referred to, in the Historia Vierteljahrsheft. There is a good article on Elias, but written before the new materials had been produced, in Wetzer and Welte, Kirchenhistorien (ed. 2).

ELIAS, JOHN (1774-1841), Welsh Nonconformist preacher and reformer, was born on the 2nd of May 1774, in the parish of Abererch, Carnarvonshire. In his youth he came under the influence of the Calvinistic Methodist revival and became a preacher at nineteen. In 1799 he married and settled at Llanfechell in Anglesey, giving up his trade as a weaver to become a small shoemaker. His fame as a preacher increased, and under the direction of Thomas Charles of Bala he established numerous Sunday schools, and gave and sent to the inhabitants of the Welsh support to the founding of the London Missionary Society, the British and Foreign Bible Society and the Religious Tract Society. On Charles’s death in 1814 he became the recognized leader of the Calvinistic Methodist Church, and the story of his life is simply a record of marvellously successful preaching tours. He died on the 8th of June 1841; ten thousand people attended his funeral.

1 On the old views relating to the succession of the priests, according to which the high-priesthood was diverted from the line of Eleazar and Phinehas into that of Ithamar, see Robertson Smith, Old Test, in Jewish Church, 2nd ed., p. 266.
ELIAS LEVITA—ELIE DE BEAUMONT

His eloquence was so remarkable that he was known as "the Welsh Demosthenes." His strength lay in his intense conviction of an intimate connexion between sin and punishment and in his power of dramatic presentation. As an ecclesiastic he was not so successful; he helped to complete his church's Consolation of Faith in 1832, and laid great stress on a clause which limited the scope of the atonement to the elect. He was a stout Tory in politics and had many friends among the Anglican clergy; he opposed the movement for Roman Catholic emancipation. Several of his sermons were published in Welsh.

ELIAS LEVITA (1469–1549), Jewish grammarian, was born at Neustadt on the Aisch, a place in Bavaria lying between Nuremberg and Würzburg. He preferred to call himself "Ashkenazi," the German, and bore also the nickname of "Bachur," the youth or student, which latter he gave as title to his Hebrew grammar. Before the end of the 15th century he went to Italy, which thenceforth remained his home. He lived first at Padua, in 1529, after the capture of this town by the army of the League of Cambray to Venice, and finally in 1513 to Rome, where he found a patron in the learned general of the Augustinian Order, the future cardinal Egidio di Viterbo, whom he helped in his study of the Kabbalah, while he himself was inspired by him to literary work. The storming of Rome by the army of the Constable de Bourbon in 1527 compelled Elia to go to Venice, where he finished his Levita's writings on the Hebrew grammar, known as Daniel Bomberg. In the years 1541 and 1542 he lived at Isy, in Southern Württemberg, where he published several of his writings in the printing-house of the learned pastor Paul Fagius. The last years of his life he spent at Venice, continuously active in spite of ill-health and the weakness of old age. His monument in the graveyard of the Jewish community at Venice boasts of him that "he illuminated the darkness of grammar and turned it into light." The importance of Levita rests both in his numerous writings and in his personal activity. In the remarkable period which saw the rise of the Reformation and gave to the study of the Hebrew Bible and to its language an importance in the history of the world, it was Levita who furthered in an extraordinary manner the study of Hebrew in Christian circles by his activity as a teacher and by his writings. To his pupils especially belong Sebastian Minoter, who translated Levita's grammatical works into Latin, also George de Selve, bishop of Lavaur, the French ambassador in Venice (1536), who was instrumental in obtaining for Levita an invitation from Francis I. to come to Paris, which invitation, however, Levita did not accept. Levita's writings on the Hebrew grammar, known as Daniel Bomberg, a text-book, 1538; Haaraka, an explanation, alphabetically arranged, of irregular word-forms; a Table of Paradigms; Pirke Eliyahu, a description—partly metrical—of phonetics, and other chapters of the grammar, 1530; his earliest work, a Commentary on Moses Kimhi's Hebrew Grammar, 1508) were by reason of their methodical exposition, their clear articulation, their avoidance of prolixity, especially suited as an introduction to the study of the Hebrew language. Amongst Levita's other writings is the first dictionary of the Targumim (Meturgeman, 1541) and the first attempt at a lexicon in which much of the treasure of late Hebrew language was explained (Tishbi, explanation of 712 new Hebrew vocables, as a supplement to the dictionaries of David Kimhi and Nathan b. Yehiel, 1542). Scientifically most valuable, and of original importance, are the works of Levita on the Massora; his Concordance to the Massora (Sefer Zikhronot completed in the second revision 1536), of which hitherto only a small part has been published, and especially his most celebrated book Massoreth HaMassoreth (1538), published with English translation by E. D. Ginsburg, London, 1891. This was the first attempt to give a systematic account of the contents and history of the Massora. By his criticism of the Massora, and especially by proving that the punctuation of the books of the Hebrew Bible is of late origin, Levita exercised an epoch-making influence. Of his other writings may be mentioned his running commentary on David Kimhi's Grammar and Dictionary (in the Bomberg editions 1545, 1546), his German translation of the Psalms (1545) and the Baba-Buch (more properly Burowbuch, a German recension of the Italian novel Historia di Buoro d'Autone, 1508).

ELIE DE BEAUMONT, JEAN BAPTISTE ARMAND LOUIS LÉGROCE (1798–1874), French geologist, was born at Cancon, in Calvados, on the 25th of September 1798. He was educated at the Lyceé de l'Henri IV, where he took the first prize in mathematics and physics; at the École Polytechnique, where he stood first at the exit examination in 1819; and at the École des Mines (1810–1822), where he began to show a decided preference for the science with which his name is associated. In 1823 he was selected along with Dufrenoy by Brochant de Villiers, the professor of geology in the École des Mines, to accompany him on a scientific tour to England and Scotland, in order to inspect the mining and metallurgical establishments of the country, and to study the principles on which Greenough's geological map of England (1828) had been prepared, with a view to the construction of a similar map of France. In 1835 he was appointed professor of geology at the École des Mines, in succession to Brochant de Villiers, whose assistant he had been in the duties of the chair since 1827. He held the office of engineer-in-chief of mines in France from 1833 until 1847, when he was appointed inspector-general; and in 1861 he became vice-president of the Conseil-Général des Mines and a grand officer of the Legion of Honour. His growing scientific reputation secured him the election as a corresponding member of the Royal Academy of Sciences of France and of the Royal Society of London. By a decree of the president he was made a senator of France in 1852, and on the death of Arago (1853) he was chosen perpetual secretary of the Academy of Sciences. Élie de Beaumont's name is widely known to geologists in connexion with his theory of the origin of mountain ranges, first propounded in a paper read to the Academy of Sciences in 1829, and afterwards elaborated in his Notice sur le système des montagnes (3 vols., 1852). According to his view, all mountain ranges parallel to the same great circle of the earth are of strictly contemporaneous origin, and between the great circles a relation of symmetry exists in the form of a pentagonal réseau. An elaborate statement and criticism of the theory was given in his anniversary address to the Geological Society of London in 1853 by William Hopkins (Quart. Journ. Geol. Soc.). The theory has not found general acceptance, but it proved of great value to geological science, owing to the extensive additions to the knowledge of the structure of mountain ranges which its author made in endeavouring to find facts to support it. Probably, however, the best service that Élie de Beaumont rendered was in connexion with the geological map of France, in the preparation of which he had the leading share. During this period Élie de Beaumont published many important memoirs on the geology of the country. After his supernumeration at the École des Mines he continued to superintend the issue of the detailed maps almost until his death,
ELIJAH

which occurred at Canon on the 21st of September 1874. His academic lectures for 1843-1844 were published in 2 vols., 1845-1849, under the title Leçons de géologie pratique.

ELIJAH (a Hebrew name meaning "Yah[weh] is God"), in the Bible, the greatest and sternest of the Hebrew prophets, makes his appearance in the narrative of the Old Testament with an abruptness not out of keeping with his character and work (1 Kings xviii. 1). The first and most important part of his career lay in the reign of Ahab, i.e., during the first half of the 9th century B.C. He is introduced as predicting the drought (1) God was to send upon Israel as a punishment for the apostasy into which Ahab had brought him, his household, and his people, by his worship of Baal, and his cruelty to the worshipers of the true God. During the first portion of this period Elijah found a refuge by the brook Cherith, "before the Jordan." This description leaves it uncertain whether the brook was to the east of Jordan in Elijah's native Gilead, or — less probably — to the west in Samaria. Here he drank of the brook and was fed by ravens, who night and morning brought him bread and flesh. 8 When this had dried up, the prophet betook himself to Zarephath, a Phoenician town near Sidon. At the gate of the town he met the widow to whom he had been sent, gathering sticks for the preparation of what she believed was to be her last meal. She received the prophet with hospitality, sharing with him all but exhausted store, in faith of his promise in the name of the God of Israel that the supply would not fail so long as the drought lasted. During this period her son died and was miraculously restored to life in answer to the prayer of the prophet (1 Kings xvii. 14-24).

7

Elijah emerged from his retirement in the third year, when, the famine having reached its worst, Ahab and his minister Obadiah sent themselves to search the land for provender for the royal stables. To the latter Elijah suddenly appeared, and announced his intention of showing himself to Ahab. The king met Elijah with the reproach that he was "the trouble of Israel," which the prophet boldly flung back upon him who had forsaken the commandments of the Lord and followed the Baalim. 4 The retort was accompanied by a challenge — or rather a command — to the king to assemble on Mount Carmel "all Israel" and the four hundred and fifty prophets of Baal. (The four hundred prophets of Asherah have been added later.) From the allusion to an "altar of Jehovah that was broken down" (1 Kings xviii. 39) it has been inferred that Carmel was an ancient sacred place. (On Mount Carmel and Elijah's connexion with it in history and tradition see Carmel.)

The scene on Carmel is perhaps the grandest in the life of Elijah, or indeed in the whole of the Old Testament. As a typical embodiment for all time of the conflict between superstition and true religion, it is (often with a refrain of "is Jehovah") translated in the vocabulary of the Lord into that of spiritual symbolism, and it has accordingly furnished at once a fruitful theme for the religious teacher and

1 The text is uncertain. According to the LXX., he was a native of Tishbite in Gilead; a more natural reading, Klostermann’s conjecture that the original name of his home was Jabesh-Gilead is attractive but unnecessary. His appearance in the narrative, like Melchizedek, "without father, without mother" (Heb. vii. 3), gains an immediate, and various rabbinical traditions, such as that he was the Phinehas, the grandson of Aaron, returned to earth, or that he was an angel in human form.

2 His duration is vaguely stated; from Luke iv. 25, James v. 17, we learn that it lasted three years and a half; but according to the tradition of the prophet on the nature of the prophet (Jos. Ant. viii. 13. 2) only one year.

3 The rationalistic view that the word translated "ravens" should be "Arabians" is improbable. Cheyne’s suggestion that the word should be "robbers" (as agree with Josephus, Ant. viii. 13. 2, "he departed into the southern parts") and with 1 Kings xix. 3. 8; "Jordon" may refer to another river, if it be not a gloss; see Cheyne, Ency. Bib., s.v. "Cerith." At least the allusion to the brook Cherith in xviii. 1 may be accounted for by the supposition that the commencement of the narrative had been omitted by the editor of xvi. 29 sqq. Hence we are not told the cause of Ahab’s hostility towards Elijah, nor is the allusion to Jezebel’s massacre of the prophets (xviii. 13. 13) explained. It would appear from Obadiah’s words in ver. 9 that he himself was in fear of his life. Later tradition supposed he was the captain of 2 Kings iv. 13, or that the widow of 2 Kings iv. 1 had been his wife.

a lofty inspiration for the artist. The false prophets were allowed to invoke their gods in whatever manner they pleased. The only interruption came in the mocking encouragement of Elijah (1 Kings xviii. 27), a rare instance of grim sarcastic humour occurring in the Bible. Its effect upon the false prophets was to increase their frenzy. The evening came, 4 and the god had made no sign. Elijah now stepped forward with the quiet confidence and dignity that became the prophet and representative of the true God. All Israel is represented symbolically in the twelve stones with which he built the altar; and the water which he poured upon the sacrifice and into the surrounding trench was apparently designed to prevent the suspicion of fraud! In striking contrast to the "vain repetitions" of the false prophets are the simple words with which Elijah makes his prayer to Yahweh. Once only, with the calm assurance of one who knew that his prayer would be answered, he invokes the God of his fathers. The answer comes at once: "The fire of the Lord (Gen. xix. 24, Lev. x. 2) fell and consumed the burnt offering, and the wood, and the stones, and the dust, and licked up the water that was in the trench." So convincing a sign was irresistible; all the false prophets and the God of Elijah were seen to be mere impostors. Yahweh is the true God. This was immediately followed by the destruction of the false prophets, slain by Elijah beside the brook Kishon (xviii. 40). The deed, though not without parallel in the Old Testament history, stamps the peculiarly vindictive character of Elijah's prophetic mission.

On the evening of the day that had witnessed the decisive contest, Elijah proceeded once more to the top of Carmel, and there, with "his face between his knees" (possibly engaged in the prayer referred to in James v. 17 sqq.), waited for the longlooked-for blessing. His servant, sent repeatedly to search the sky for signs, returned the seventh time reporting a little cloud arising out of the sea "like a man’s hand." 9 The sky was speedily full of clouds and a great rain was falling when Ahab, to escape the storm, set out in his chariot for Jezreel. As a proof of Elijah’s supernatural power, it is stated that the prophet, for some unknown object, ran before the chariot to the entrance of Jezreel, a distance of at least 16 m. On being told what had taken place, Ahab sent a messenger to Elijah with a vow that ere another day had passed his life would be even as the lives of the prophets of Baal, and the threat was enough to cause him to take to instant flight (xix. 1-3; cp. LXX. in v. 2). The first stage of the journey was to Beersheba, on the southern limits of Judah. Here he left his servant (according to old Jewish tradition, the widow’s son of Zarephath, afterwards the prophet Jonathan), and proceeded a day’s journey into the wilderness. Resting under a solitary broom bush (a kind of genista), he gave vent to his disappointment in a prayer for death. By another of those many miraculous interpositions which occur in his history he was twice supplied with food and drink, in the strength of which he journeyed forty days and forty nights until he came to Horeb, where he lodged in a cave. 5 A hole "just large enough for a man’s body" (Stanley), immediately below the summit of Jebel Mûsa, is still pointed out by tradition as the cave of Elijah.

If the scene on Carmel is the grandest, that on Horeb is spiritually the most profound in the story of Elijah (xix. 6 sqq.). The "broom bush" concept that the fire of Horeb in the earthquake, not in the fire, but in the still small voice that followed the Lord made himself known. A threefold commission was laid upon him: he was to return to Damascus and anoint Hazael king of Syria; he was to anoint Jehu, the son of Nimshi,
as king of Israel in place of Ahab; and as his own suc-
cessor in the prophetic office he was to anoint Elisha (xix. 15-16).

Leaving Horeb and proceeding northwards along the desert route to Damascus, Elijah met Elisha engaged at the plough probably near his native place, Abel-meholah, in the valley of the Jordan, and by the symbolical act of casting his mantle upon him, consecrated him to the prophetic office. This was the only command of the three which he fulfilled in person; the other two were carried out by his successor. After the call of Elijah the narrative contains no notice of Elijah for several years, although the LXX., by placing 1 Kings xxi. before ch. xx., proceeds at once to the tragic story of Naboth's vineyard (see Jezreel). He is now the champion of freedom and purity of life, like Nathan when he confronted David for the murder of Uriah. Without any indication of whence or how he came, he again appeared, as usual with startling abruptness, in the vineyard when Ahab entered to take possession of it, and pronounced upon the king and his house that awful doom (1 Kings xxii. 17-24), which, though deferred for a time, was ultimately fulfilled to the letter (see Jezreel).

As we have already seen, the more alarming denunciation of the house of Ahab, Elijah's function as a messenger of wrath was fully discharged (2 Kings i.). When Ahaziah, the son of Ahab, having injured himself by falling through a lattice, sent to inquire of Baal-zebub, the god of Ekron, whether he should recover, the prophet was commanded to appear to the messengers and tell them that, for this resort to a false god, the king should die. The effect of his appearance was such that they turned back without attempting to fulfil their errand. Ahaziah despatched a captain with a band of fifty to arrest him. They came upon Elijah seated on "the mount,"—probably Carmel. The imperious terms in which he was summoned to come down were punished by fire from heaven, which descended at the bidding of Elijah and consumed the whole land. A second captain and fifty were despatched, behaved in a similar way, and met the same fate. The leader of a third troop took a humber tone, sued for mercy, and obtained it. Elijah then went with them to the king, but only to repeat before his face the doom he had already made known to his messengers, which was almost immediately afterwards fulfilled. The spirit, even the style of this narrative, points unmistakably to its being of late origin. It shocks the moral sense with its sanguinary character more than, perhaps, any other Old Testament story.

The only mention of Elijah's name in the book of Chronicles (2 Chronicles xxii. 12-15) is where he is represented as sending a letter of rebuke and denunciation to Jehoram, son of Jehoshaphat, king of Judah. The chronological difficulties which are involved suggest that the floating traditions of this great personality were easily attached to well-known names whether strictly contemporary or not. It was before the death of Jehoshaphat that the last grand scene in Elijah's life occurred (2 Kings ii., see ii. 1). He had taken up his residence with Elisha at one of the prophet's guilds at Gilgal. His approaching end seems to have been known to the guilds at Bethel and Jericho, both of which they visited in their last journey. At the Jordan, Elijah, wrapping his prophet's mantle together, smote the water, and it divided, so by a last miracle passed over on dry ground. When they had crossed the master desired the disciple to ask some parting blessing. The request for a double portion (i.e. probably a first-born's portion, Deut. xxi. 17) by the prophet's spirit Elijah characterized as a hard thing; but he promised to grant it if Elisha should see him when he was taken away.

The end is told in words of simple sublimity: "And it came to pass, as they still went on and talked, that, behold, there appeared a chariot of fire, and horses of fire, which parted them both asunder; and Elijah went up by a whirlwind into heaven" (2 Kings ii. 11). It is scarcely necessary to point out, however, that through the figure the narrative evidently means to convey as fact that Elijah passed from earth, not by the gates of death, but by miraculous translation. Such a supernatural close is in perfect harmony with a career into every stage of which the supernatural enters as an essential feature. For whatever explanation may be offered of the miraculous element in Elijah's life, it must obviously be one that accounts not for a few miraculous incidents only, which might be mere excrescences, but for a series of miraculous events so closely connected and so continuous as to form the main thread of the history.

Elisha occupied an altogether peculiar place in later Jewish history and tradition. For the general belief that he should return for the restoration of Israel cf. Mal. iv. 5-6; Matt. xi. 14, xvi. 11; Luke ix. 21, and on the development of the thought see Bousset, Gnosis. and the Gnostics; E. W. Kraeling, The Gnostics and the New Testament; Encyc. Bib., iii., 516; Encyc. of Religion and Ethics, vii., 754 sqq. The nature and the origin of the command to Christ to "proclaim the kingdom of God," is highly significant. The Old Testament prophecy of the "prophet of the spirit" (Elijah), a translation of the Greek word, was supposed to be fulfilled in Elisha's mission, inasmuch as he was also a prophet of the spirit, a translation of the Hebrew word "ruach." Elisha's action in anointing the two sons of Jehu as kings of Israel is the allocation of the specialized prophetic office and of the name of Elijah to the second son, who was afterwards crowned by his predecessor himself (2 Kings x. 31-33). There is no reason to doubt the historical basis of the tradition. Elisha, moreover, is described in the apocalyptic vision of Daniel as 

ELIJAH WILNA—ELIOT

ELIJAH WILNA, or ELIJAH BEN SOLOMON, best known as the GAON ELIJAH OF WILNA (1720-1797), a noted Talmidic who hovered between the new and the old schools of thought. Orthodox in practice and feeling, his critical treatment of the rabbinic literature prepared the way for the scientific investigations of the 19th century. As a teacher he was one of the first to discriminate between the various strata in rabbinic records; to him was due the revival of interest in the older Midrash (q.v.) and in the Palestinian Talmud (q.v.), interest in which had been weak for some centuries before his time. He was an ascetic, and was a keen opponent of the emotional mysticism which was known as the new Hassidism. See S. Schechter's Studies in Judaism (London, 1896). His voluminous writings are classified in the Jewish Encyclopedia, v. 134.

ELIOT, CHARLES WILLIAM (1834— ), American educationalist, the son of Samuel Atkins Eliot (1782-1862), mayor of Boston, representative in Congress, and in 1842-1853 treasurer of Harvard, was born in Boston on the 20th of March 1834. He graduated in 1853 at Harvard College, where he was successively tutor (1854-1858) and assistant professor of chemistry (1858-1859). He studied chemistry and the foundations of chemical methods in Europe in 1865-1866, was professor of analytical chemistry in the newly established Massachusetts Institute of Technology (1865-1869), although absent fourteen months in Europe in 1867-1868; and in 1869 was elected president of Harvard University, a choice remarkable at once for his youth and his being a layman and scientist. With Johns Hopkins University, Harvard, in his presidency, led in the work of efficient graduate schools. Its elective system, which has spread far, although not originated by President Eliot, was thoroughly established by him, and is only one of many radical changes which he championed with great success. The raising of entrance requirements, which led to a corresponding raising of the standards of secondary schools, and the introduction of an

Understood in Eccles. xlviii. 12 (Heb.) to mean that Elisha was twice as great as Elijah.
ELIOT, GEORGE

275

element of choice in these entrance requirements, which allowed a limited election of studies to secondary pupils, became national tendencies primarily through President Eliot's potent influence.

As chairman of a national Committee of Ten (1890) on secondary school studies, he urged the abandonment of brief disconnected "information" courses, the correlation of subjects taught, the equal rank in college requirements of subjects in which equal time, consecutiveness and concentration were demanded, and a more thorough study of English composition; and to a large degree he secured national sanction for these reforms and their working out by experts into a practicable and applicable system.

He laboured to unify the entire educational system, minimize prescription, cast out monotony, and introduce freedom and enthusiasm; and he emphasized the need of special training for special work. He was first to suggest (1894) co-operation by colleges in holding common entrance examinations throughout the country, and it was largely through his efforts that standards were so approximated that this became possible. He contended that secondary schools maintained by public funds should shape their courses for the benefit of students whose education goes no further than such high schools, and not be mere training schools for the universities. His success as administrator and man of affairs and as an educational reformer made him one of the great figures of his time, in whose opinions on any topic the deepest interest was felt throughout the country. In November 1908 he resigned the presidency of Harvard, and retired from the position early in 1909, when he was succeeded by Professor Abbott Lawrence Lowell. In December 1908 he was elected president of the National Civil Service Reform League.

His writings include The Happy Life (1860); Five American Contributions to Civilization, and Other Essays and Addresses (1897); Educational Reform, Essays and Addresses 1860-1897 (1868); More Money for the Public Schools (1903); Four American Leaders (1906), chapters on Franklin, Washington, Channing and Emerson; University Administration (1908); and with F. H. Storer, a Compendious Manual of Quantitative Chemical Analysis (Boston, 1869; many times reissued and revised). His annual reports as President of Harvard were notable contributions to the literature of education in America, and he delivered numerous public addresses, many of which have been reprinted.

His son, CHARLES ELIOT (1859-1897), graduated at Harvard in 1882, studied landscape architecture at the Bussey Institution of Harvard and in Europe, successfully urged the incorporation of the Massachusetts Trustees of Public Reservations (1891) and of the Metropolitan Park Commission (1892) of Boston, became landscape architect to the Metropolitan Park Commission in 1892, and in 1893, with F. L. Olmsted and J. C. Olmsted, formed the firm of Olmsted, Olmsted & Eliot, which was employed by the Metropolitan Commission. His life was written by his father, Charles Eliot, Landscape Architect (Boston, 1902).

ELIOT, GEORGE (1819-1880), the poet, was born at Tranby House, near Mary Ann (or Marian) Evans (1819-1880), afterwards Mrs J. W. Cross, born at Arbury Farm, in Warwickshire, on the 22nd of November 1819. Her father, Robert Evans, was the agent of Mr Francis Newdigate, and the first twenty-one years of the great novelist's life were spent on the Arbury estate. She received an ordinary education at respectable schools till the age of seventeen, when her mother's death, and the marriage of her elder sister, called her home in the character of housekeeper. This, though it must have sharpened her sense, already too acute, of responsibility, was an immense advantage to her mind, and, later, to her career, for, delivered from the tiresome routine of lessons and class-work, she was able to work without pedantic interruptions at German, Italian and music, and to follow her unusually good taste in reading. The life, inasmuch as she was a girl still in her teens, was no doubt monotonous, even unhappy. Just as Cardinal Newman felt, with such different results, the sadness and chain of evangelical influences from his boyhood till the end of his days, so Marian Evans was subjected all through her youth by a severe religious training which, while it pinched her mind and crushed her spirit, attracted her idealism by the very hardness of its perfect counsels. It is not surprising to find, therefore, that when Mr Evans moved to Coventry in 1841, and so enlarged the circle of their acquaintance, she became much interested in some new friends, Mr and Mrs Charles Bray and Mr Charles Hennell. Mr Bray had literary taste and wrote works on the Education of the Feelings, the Philosophy of Necessity, and the like. Mr Hennell had published in 1838 An Enquiry concerning the Origin of Christianity. Miss Evans, then twenty-two, absorbed immediately these unexpected, and, at that time, daring habits of thought. So compelling was the atmosphere that it led to a complete change in her opinions.

Kind in her affection, she was relentless in argument. She refused to go to church (for some time, at least), wrote painful letters to a former governess—the pious Miss Lewis—and barely avoided an irremediable quarrel with her father, a churchman of the old school. Here was rebellion indeed. But rebels come, for this was the part of the provinces where petty tyrannies, exercised by small souls, show the scheme of the universe on the meanest possible scale. George Eliot was never orthodox again; she abandoned, with fierce determination, every creed, and although she passed, later, through various phases, she remained incessantly a rationalist in matters of faith and in all other matters. It is nevertheless true that she wrote admirably about religion and religious persons. She had learnt the evangelical point of view; she knew—none better—the strength of religious motives; vulgar doubts of this fact were as distasteful to her as they were to another eminent writer, to whom she refers in one of her letters (dated 1853) as "a Mr Huxley, who was the centre of interest" at some "agreeable evening." Her books abound in tributes to Christian virtue, and one of her own favourite characters was Dinah Morris in Adam Bede.

She undertook, about the beginning of 1844, the translation of Strauss's Leben Jesu. This work, published in 1846, was considered scholarly, but it met, in the nature of things, with no popular success. On the death of Mr Evans in 1849, she went abroad for some time, and we hear of no more literary ventures till 1851, when she accepted the assistant-editorship of the Westminster Review. For a while she had lodgings at the offices of that publication in the Strand, London. She wrote several notable papers, and became acquainted with many distinguished authors of that period—among them Herbert Spencer, Carlyle, Harriet Martineau, Francis Newman and George Henry Lewes. Her friendship with the last-named led to a closer relationship which she regarded as a marriage. Among the many criticisms passed upon this step (in view of the fact, among other considerations, that Lewes had a wife living at the time), no one has denied her courage in defying the law, or questioned the quality of her act in a singularly false position. That she felt the deepest affection for Lewes is evident; that we owe the development of her genius to his influence and constant sympathy is all but certain. Yet it is also sure that what she gained from his intimate companionship was worthily repaid by an unceasing consciousness that most people thought her guilty of a grave mistake, and found her written words, with their endorsement of traditional morality, wholly at variance with the circumstances of her private life. Doubts of her suffering in this respect will be at once dismissed after a study of her journal and letters. Stilted and unnatural as these are to a tragic degree, one can read well through the lines, and also in the elaborate dedication of each manuscript to "my husband" (in terms of the strongest love), that self-repression, coupled with audacity, does not make for peace. Her sensitiveness to criticism was extreme; a flippancy paragraph of an illiterate review with regard to her work actually affected her for days. The whole history of her union with Lewes is a complete illustration of the force of sheer will—in that case partly her own and not incomconsiderably his—over a nature essentially unfitted for a bold stand against attacks. At first she and the man whom she had described "as a sort of miniature
Mirabeau in appearance," went abroad to Weimar and Berlin, but they returned to England the same year and settled, after several months, in lodgings at East Sheen.

In 1859 she published The Essence of Christianity, a translation from Feuerbach, a philosopher to whom she had been introduced by Charles Bray. During 1855 she translated Spinoza's Ethics, wrote articles for the Leader, the Westminster Review, and the Saturday Review—then a new thing. It was not until the following year that she attempted the writing of fiction, and produced The Sad Fortunes of the Reverend Amos Barton—the first of the Scenes of Clerical Life. These, published in Blackwood's Magazine, were issued in two volumes in 1858. The press in general extended a languid welcome to this work, and although the author received much encouragement from private sources, notably from Charles Dickens, the critics were mostly non-committal, and it was not until the publication of Adam Bede in 1859 that enthusiasm was attracted to the quality of the earlier production. Adam Bede, in the judgment of many George Eliot's masterpiece, met with a success (in her own words) "triumphantly beyond anything she had dreamed of." In 1860 appeared The Mill on the Floss. After the sensational good fortune of Adam Bede, the criticism applied to the new novel seems to have been disappointing. We find Miss Evans telling her publisher that "the book is a masterpiece," and yet the book made its way, and prepared an ever-growing army of readers for Silas Marner (1861), Romola (1862-1863), and Felix Holt (1866).

Silas Marner shows a return to her early manner—the manner of Scenes of Clerical Life. Romola, which is what is called an historical novel, owes its vitality not to the portraits of Savonarola or of the heroine, or to its vigorous pictures of Florentine life in the 15th century, but to its superb presentation of the treacherous, handsome Tito Melema, who belongs not to any one period but to every generation. Felix Holt, a novel dealing with political questions, is strained by a painfulness too severe for any reader's pleasure. Where other eminent authors have produced mechanical books, or books which were mere repetitions of their most popular effort, she erred only on the side of the ponderous and the distressing. Felix Holt is both, and it is the only one of her novels which lacks an unforgettable human note. The Spanish Gypsy (1868), a drama in blank verse, received more public response than most compositions of the kind executed by those connected with the drama or with poetic publications; and she published in 1874 another volume of verse, The Legend of Just and Other Poems.

Any depression which the author may have felt with regard to the faults found with some of the last-named books was completely cured by the praise bestowed on Middlemarch (1872). This profound study of certain types of English character was supreme at the time of its writing, and it remains supreme, of its school, in European literature. Thackeray is brilliant; Tolstoi is vivid to a point where life-likeness overpowers any consideration of art; Balzac created a whole world; George Eliot did not create, but her exposition of the upper and middle class minds of her day is a masterpiece of scientific psychology. Daniel Deronda (1876), a production on the same lines, was less satisfactory. It exhibited the same human insight, the passionate earnestness, the insinuating special pleading for hard cases, the same intellectual strength, but the subject was unwieldy, almost forbidding, and, as a result, the novel, in spite of its distinction, has never been thoroughly liked. The death of Mr Lewes in 1878 was also the death-blow to her artistic vitality. She corrected the proofs of Theophrastus Such (a collection of essays), but wrote no more. About two years later, however, she married Mr. J. W. Cross, a gentleman whose friendship was especially congenial to a temperament so abnormally dependent on affectionate understanding as George Eliot's. But she never really recovered from her shock at the loss of George Lewes, and died at 4 Cheyne Walk, Chelsea, on the 22nd of December 1880.

No right estimate of her, whether as a woman, an artist or a philosopher, can be formed without a steady recollection of her infinite capacity for mental suffering, and her need of human support. The statement that there is no sex in genius, is on the face of it, absurd. George Sand, certainly the most independent and dazzling of all women authors, neither felt nor wrote, nor thought as a man. Saint Teresa, another great writer on a totally different plane, was pre-eminently feminine in every word and idea. George Eliot, less reckless, less romantic than the Frenchwoman, less spiritual than the Spanish saint, was more masculine in style than either; but her outlook was not, for a moment, the man's outlook; her sincerity, with its odd reserves, was not quite the same as a man's sincerity, nor was her humour that genial, broad, unequivocal humour which is peculiarly virile. Hers approximated, curiously enough, to the satire of Jane Austen, both for its irony and its application to little everyday affairs. Men's humour, in its classic manifestations, is on the heroic rather than on the average scale: it is for the uncommon situations, not for the daily tea-table.

Her method of attacking a subject shows the influence of Jane Austen, especially in parts of Middlemarch; one can detect also the stronger influence of Mrs Gaskell, of Charlotte Brontë, and of Miss Edgeworth. It was, however, but an influence, and no more than a man writer, anxious to acquire a knowledge of the feminine point of view, might have absorbed from a study of these women novelists. One often hears that she is not artistic; her art is perhaps what Mr. W. E. Henley calls "the more artistic", that she tells more than should be known of her heroes and heroines. But it should be remembered that Jane Austen dealt with familiar domestic types, whereas George Eliot excelled in the presentation of extraordinary souls. One woman drew members of polite society with correct notions, while the other woman depicted social rebels with ideas and ideals. In every one of George Eliot's books, the protagonists, tortured by dreams of perfection, are in revolt against the prudent compromises of the worldly. All through her stories, one hears the clash of "the heroic for earth too high," and the desperate philosophy, disguised it is true, of Omar Khayyam. In her day, Epicureanism had not reached the life of the people, nor passed into the education of the mob. Few dared to confess that the pursuit of pleasure, whether real or imagined, was the aim of mankind. The charm of Jane Austen is the charm of the untroubled and well-to-do materialist, who sees in a rich marriage, a comfortable house, carriages and an assured income the best to strive for; and in a fickle lover of either sex or the loss of money the severest calamities which can befal the human spirit. Jane Austen depicted the greater number of her characters: George Eliot suffered with each of hers. Here, perhaps, we find the reason why she is accused of being inartistic. She could not be impersonal.

Again, George Eliot was a little scornful to those of both sexes who had neither special missions nor the consciousness of this deprivation. Men are seldom in favour of missions in any field. She demanded, too strenuously from the very beginning, an aim, more or less altruistic, from every individual; and as she advanced in life this claim became the more imperative, till at last it overpowered her art, and transformed a great delineator of humanity into an eloquent observer with far too many personal prejudices. But she was altogether free from cynicism, bitterness, or the least tendency to pride of intellect. She suffered from bodily weakness the greater part of her life, and, but for an extraordinary mental health— inherited from the fine yeoman stock from which she sprang—it is impossible that she could have retained, at all times, so sane a view of human conduct, or been the least sentimental among women writers of the first rank— theewholly without morbidity in any disguise. The accumulation of mere book knowledge, as opposed to the friction of a life spent among all sorts and conditions of men, drove George Eliot at last to write as a specialist for specialists: joy was lost in the consuming desire for strict accuracy: her genius became more and more speculative, less and less emotional. The highly trained brain suppressed the impulsive heart,—the heart described with such candour and pathos as Maggie Tulliver's in The Mill on the Floss. For this reason—chiefly because philosophy is popularly associated with inactive depression,
whereas human nature is held to be eternally exhilarating—her later works have not received so much praise as her earlier productions. But one has only to compare Romola or Daniel Deronda with the compositions of any author except herself to realize the greatness of her designs, and the astonishing gifts brought to their final accomplishment.

Cross (3 vols., 1885–1887); George Eliot, by Sir Leslie Stephen, in "The English Men of Letters" series (1902); by Oscar Browning, "Great Writers" series (1899), with a bibliography by J. P. Anderson; by Mathilde Blind, "Eminent Women" series, a new edition of which also contains a bibliography (Boston, Mass., 1904). (P. M. T. C.)

ELIOT, SIR J. (1592–1632), English statesman, son of Richard Eliot, a member of an old Devonshire family lately settled in Cornwall, was born at his father's seat at Port Eliot in Cornwall in 1592. He matriculated at Exeter College, Oxford, on the 4th of December 1607, and left the university after a residence of three years he studied law at one of the inns of court. He also spent some months travelling in France, Spain and Italy, in company, for part of the time, with young George Villiers, afterwards duke of Buckingham. He was only twenty-two when he began his parliamentary career as member for St Germans, Cornwall, on the 26th of October, 1612. In 1618 he was knighted, and next year through the patronage of Buckingham he obtained the appointment of vice-admiral of Devon, with large powers for the defence and control of the commerce of the county. It was not long before the characteristic energy with which he performed the duties in his office involved him in difficulties. After many attempts, in 1623 he succeeded by a clever but dangerous manoeuvre in entrapping the famous pirate John Nutt, who had for years infested the southern coast, inflicting immense damage upon English commerce. The issue is noteworthy. The pirate, having a powerful protector at court in Sir George Calvert, the secretary of state, was paroled; while the vice-admiral, upon charges which could not be substantiated, was flung into the Marshalsea, and detained there nearly four months.

A few weeks after his release Eliot was elected member of parliament for Newport (February 1624). On the 27th of February he delivered his first speech, in which he at once revealed his great powers as an orator, demanding boldly that the house should be made safe to those who, as statesmen, in the former parliament, should be secured. In the first parliament of Charles I., in 1625, he urged the enforcement of the laws against the Roman Catholics. Meanwhile he had continued the friend and supporter of Buckingham and greatly approved of the war with Spain. Buckingham's incompetence, however, and the bad faith with which both he and the king continued to treat the parliament, alienated Eliot completely from the administration. Distrust of his former friend quickly grew in Eliot's excitable mind to a certainty of his criminal ambition and treason to his country. Returned to the parliament of 1626 as member for St Germans, he found himself, in the absence of other chiefs of the opposition whom the king had secured by nominating them sheriffs, the leader of the House. He immediately demanded an inquiry into the recent disaster at Cadiz. On the 27th of March he made an open and daring attack upon Buckingham and his evil administration. He was not intimidated by the king's threatening intervention on the 29th, and persuaded the House to demand the actual grant of the subsidies and to present a remonstrance to the king, declaring its right to examine the conduct of ministers. On the 8th of May he was one of the managers who carried Buckingham's impeachment to the Lords, and on the 10th he delivered the charges against him, comparing him in the course of his speech to Sejanus. Next day Eliot was sent to the Tower. On the Commons declining to proceed with business as long as Eliot and Sir Dudley Digges (who had been imprisoned with him) were in confinement, they were released, and parliament was dissolved on the 15th of June. Eliot was immediately dismissed from his office of vice-admiral of Devon, and in 1627 he was again imprisoned for refusing to pay a forced loan, but liberated shortly before the assembling of the parliament of 1628, to which he was returned as member for Cornwall. He joined in the resistance now organized to arbitrary taxation, was foremost in the Petition of Right, continued his outspoken censure of Buckingham, and after the latter's assassination in August, led the attack in the session of 1629 on the ritualists and Armenians.

In February the great question of the right of the king to levy tonnage and poundage came up for discussion; and on the king ordering an adjournment of parliament, the speaker, Sir John Finch, was held down in the chair while Eliot's resolutions against illegal taxation and innovations in religion were read to the House by Holles (q.v.). In consequence, Eliot, with eight other members, was imprisoned on the 4th of March in the Tower. He refused to answer in his examination, relying on his privilege of parliament, and on the 29th of October was removed to the Marshalsea. On the 26th of January he appeared at the bar of the king's bench, with Holles and Valentine, to answer a charge of conspiracy to resist the king's order, and refusing to acknowledge the jurisdiction of the court he was fined £2000 and ordered to be imprisoned during the king's pleasure and till he had made submission. This he steadfastly refused. While some of the prisoners appear to have had certain liberty allowed them, Eliot's treatment was markedly severe. Charles's anger had been from the first directed chiefly against him, not only as his own political antagonist but as the prosecutor and bitter enemy of Buckingham; "an outlawed man," he described him, "desperate in mind and fortune."

Eliot languished in prison for some time, during which he wrote several works, his Negotium posteriorum, an account of the parliament in 1625; The Monarchie of Man, a political treatise; De jure majestatis, a Political Treatise of Government; and An Apology for Socrates, his own defence. In the spring of 1632 he fell into a decline. In October he petitioned Charles for permission to go into the country, but leave could only be obtained at the price of submission, and was finally refused. He died on the 27th of November 1632. When his son requested permission to move the body to Port Eliot, Charles, whose resentment still survived, returned the curt refusal: "Let Sir John Eliot be buried in the church of that parish where he died." The manner of Eliot's death, not without suspicion of foul play, and as the result of the king's implacability and the severe treatment to which he had been subjected, in the Todd, probably, was a more severe than any other single incident in embittering and precipitating the dispute between king and parliament; and the tragic sacrifice of a man so gifted and patriotic, and actuated originally by no antagonistic feeling against the monarchy or the church, is the surest condemnation of the king's policy and administration. Eliot was essentially a great orator, inspired by enthusiasm and high ideals, which he was able to communicate to his hearers by his eloquence, but, like Chatham afterwards, he had not only the gifts but the failings of the orator, was incapable of well-reasoned and balanced judgment, and, though one of the greatest personalities of the time, was inferior to Pym both as a party leader and as a statesman.

Eliot married Rhuddagund, daughter of Richard Gedie of Trebursye in Cornwall, by whom he had five sons, from the youngest of whom Nicholas the present earl of St Germans is descended, and four daughters.

The Life of Sir J. Eliot, by J. Forster (1864), is supplemented and corrected by C. Gardiner, in History of England, vols. v.-vii., and the article in the Dict. of Nat. Biog., by the same author. Eliot's writings, together with his Letter-Book, have been edited by Dr Grosart.

ELIOT, JOHN (1604–1690), American colonial clergyman, known as the "Apostle to the Indians," was born probably at Widford, Hertfordshire, England, where he was baptized on the 5th of August 1604. He was the son of Bennett Eliot, a middle-class farmer. Little is known of his boyhood and early manhood except that he took his degree of B.A. at Jesus College, Cambridge, in 1622. It seems probable that he entered the ministry of the Established Church, but there is nothing definitely known of him until 1620–1630, when he became an usher or assistant at the school of the Rev. Thomas Hooker, at Little Baddow, near Chelmsford. The influence of Hooker apparently determined
him to become a Puritan, but his connexion with the school ceased in 1630, when Laud's persecutions drove Hooker into exile. The realization of the difficulties in the way of a non-conforming clergyman in England undoubtedly determined Eliot to emigrate to America in the autumn of 1631, where he settled first at Boston, assisting for a time at the First Church. In November 1632 he became "teacher" to the church at Roxbury, with which his connexion lasted until his death. There he married Hannah Mulford, who had been betrothed to him in England, and who became his constant helper. In the care of the Roxbury church he was associated with Thomas Welde from 1632 to 1641, with Samuel Danforth (1626-1674) from 1649 to 1674, and with Nehemiah Walter (1603-1730) from 1688 to 1690.

Inspired with the idea of converting the Indians, his first step was to perfect himself in their dialects, which he did by the assistance of a young Indian whom he received into his home. With his aid he translated the Ten Commandments and the Lord's Prayer. He first successfully preached to the Indians in their own tongue at Nonantum (Newton) in October 1648. At the third meeting several Indians declared themselves converted, and were soon followed by many others. Eliot induced the Massachusetts General Court to set aside land for their residence, the same body also voting him £10 to prosecute the work, and directing that two clergymen be annually elected by the clergy as preachers to the Indians. As soon as the success of Eliot's endeavours became known, the necessary funds flowed in upon him from private sources in both Old and New England. In July 1649 Parliament incorporated the "Society for the Propagation of the Gospel in New England," which henceforth supported and directed the work inaugurated by Eliot. The first appeal for aid brought contributions of £11,000. In 1631 the Christian Indian town founded by Eliot was removed from Nonantum to Natick, where residences, a meeting-house, and a school-house were erected, and where Eliot preached, when able, once in every two weeks as long as he lived. To this community Eliot applied a plan of government by means of tens, fifties and hundreds, which he subsequently advocated as suitable for all England. Eliot's missionary labours encouraged others to follow in his footsteps. A second town under his direction was established at Ponkapog (Stoughton) in 1654, in which he had the assistance of Daniel Gookin (c. 1621-1698). His success was duplicated in Martha's Vineyard and Nantucket by the Mayhews, and by 1674 the unofficial census of the "praying Indians" numbered 4000. King Philip's War (1675-76) was a staggering blow to all missionary enterprise; and although few of the converted Indians proved disloyal, it was some years before adequate support could again be enlisted. Yet at Eliot's death, which occurred at Roxbury on the 21st of May 1660, the missions were at the height of their prosperity, and that the results of his labours were not permanent was due only to the racial traits of the New English tribes.

Of wider influence and more lasting value than his personal labours as a missionary was Eliot's work as a translator of the Bible and various religious works into the Massachusetts dialect of the Algonquin language. The first work completed was the Catechism, published in 1653 at Cambridge, Massachusetts, the first book to be printed in the Indian tongue. Several years elapsed before Eliot completed his task of translating the Bible. The New Testament was at last issued in 1661, and the Old Testament followed two years later. The New Testament was bound with it, and thus the whole Bible was completed. To it were added a Catechism and a metrical version of the Psalms. The title of this Bible, now a great rarity, is Manussee Wunneetupanatomee Upl-Bibilum God nanessew Nukkone Testament kah work Wusku Testament-Ne quoskinnumak wuskee Wuttineewnuch Christ noh assowest John Eliot; literally translated, "The Whole Holy His-Bible God, both Old Testament and also New Testament. This turned by the servand-of-Christ, who is called John Eliot."

This book was printed in 1663 at Cambridge, Mass., by Samuel Green and Marmaduke Johnson, and was the first Bible printed in America. In 1685 appeared a second edition, in the preparation of which Eliot was assisted by the Rev. John Cotton (1640-1699), the younger, of Plymouth, who also had a wide knowledge of the Indian tongue.

Besides his Bible, Eliot published at Cambridge in 1664 a translation of Baxter's Call to the Unconverted, and in 1665 an abridged translation of Bishop Bayly's Practice of Piety. With the assistance of his sons he completed (1664) his well-known Indian Grammar Began, printed at Cambridge, Massachusetts, in 1666. It was reprinted in vol. ix. of the Collections of the Massachusetts Historical Society. The Indian Primer, comprising an exposition of the Lord's Prayer and a translation of the Larger Catechism, was published at Cambridge in 1669, and was reprinted under the editorial superintendence of Mr John Small of the university of Edinburgh in 1877. In 1671 Eliot printed in English a little volume entitled Indian Dialogues, followed in 1672 by his Logick Primer, both of which were intended for the instruction of the Indians in English. His last translation was Thomas Shepard's Sincere Convert, completed and published by Grindal Rawson in 1680. Eliot's literary activity, however, extended into other fields than that of Indian instruction. He was, with Richard Mather, one of the editors of the Bay Psalm Book (1640). Several tracts written wholly or in part by him in the nature of reports to the society which supported his missions were published at various times in England. In 1660 he published a curious treatise on government entitled The Christian Commonwealth, in which he found the ideal of government in the ancient Jewish state, and proposed the reorganization of the Indian government on the basis of a numerical subdivision of the inhabitants. His Harmony of the Gospels (1679) was a life of Jesus Christ.

BIBLIOGRAPHY.—An account of Eliot’s life and work is contained in Williston Walker’s Ten New England Leaders (New York, 1901). There is a "Life of John Eliot," by Convers Francis, in Sparks’ American Biography, vol. v. (New York, 1853); another by N. Adams (Boston, 1647); and a sketch in Cotton Mather’s Magnalia (London, 1702). For a good account of his publications in the Indian language see the chapter on "The Indian Tongue and its Literature," by J. H. Trumbull, in vol. i. of the Memorial History of Boston (1883).

ELIS, or ELEIA, an ancient district of southern Greece, bounded on the N. by Achaea, E. by Arcadia, S. by Messenia, and W. by the Ionia Sea. The local form of the name was Valis, or Valeia, and its meaning, in all probability, "the lowland." In its physical constitution Elis is practically one with Achaea and Arcadia; its mountains are mere foothills of the Arcadian highlands, and its principal rivers are fed by Arcadian springs. From Erymanthus in the north, Skollis (now known as Mavri and Santanere in different parts of its length) stretches toward the west, and Phoelo along the eastern frontier; in the south a prolongation of Mount Lycaean bore in ancient times the names of Minthe and Lapithus, which have given place respectively to Alvena and to Kaliropa and Smera. These mountains are well clothed with vegetation, and present a soft and pleasing appearance in contrast to the picturesque wildness of the parent ranges. They gradually sink towards the west and die off into what was one of the richest alluvial tracts in the Peloponnesus. Except where it is broken by the rocky promontories of Chelonatas (now Chelotz) and Iethyus (now Katakolo), the coasts are low, with stretches of sand in the north and lagoons and marshes towards the south. During the summer months communication with the sea being established by means of canals, these lagoons yield a rich harvest of fish to the inhabitants, who at the same time, however, are almost driven from the coast by the swarms of gnats. The district for administrative purposes forms part of the nome of Elis and Achaea (see GREECE).

Elis was divided into three districts—Hollow or Lowland Elis (h kokha ‘HAs), Pitsatis, or the territory of Pisa, and Triphylia, or the country of the three tribes. (1) Hollow Elis, the largest and most northern of the three, was watered by the Peneus and its tributary the Ladon, whose united stream forms the modern Gastouni. It included not only the champaign country originally designated by its name, but also the mountainous region of Acroora, occupied by the offshore of Erymanthus. Besides the capital city of Elis, it contained Cyllene, an Arcadian settlement...
on the sea-coast, whose inhabitants worshipped Hermes under the phallic symbol; Pylus, at the junction of the Peneus and the Ladon, which, like so many other places of the same name, claimed to be the city of Nestor, and the fortified frontier town of Lasion, the ruins of which are still visible at Kutl, near the village of Kumani. The district was famous in antiquity for its cattle and horses; and its byssus, supposed to have been introduced by the Phoenicians, was inferior only to that of Palestine.

(2) Pisatis extended south from Hollow Elis to the right bank of the Alpheus, and was divided into eight departments called after as many towns. Of these Salmone, Hercleae, Cysision, Dysponentium and Harpina are known—the last being the reputed burial-place of Marmax, the sitor of Hippodamia. From the time of the early investigators it has been disputed whether Pisa, which gave its name to the district, has ever been a city, or was only a fountain or a hill. By far the most important spot in Pisatis was the scene of the great Olympic games, on the northern bank of the Alpheus (col Olimpia). (3) Triphylla stretches south from the Alpheus to the Neda, which forms the boundary towards Messenia. Of the nine towns mentioned by Polybius, only two attained to any considerable influence—Lepreum and Macistus, which gave the names of Lepreatis and Macistia to the southern and northern halves of Triphylla. The former was the seat of a strongly independent population, and continued to take every opportunity of resisting the supremacy of the Eleans. In the time of Pausanias it was in a very decadent condition, and possessed only a poor brick-built temple of Demeter; but considerable remains of its outer walls are still in existence near the village of Strovitzi, on a part of the Minhe range.

The original inhabitants of Elis were called Caunones and Paroreatae. They are mentioned for the first time in Greek history under the title of Epeians, as setting out for the Trojan War, and they are described by Homer as living in a state of constant warfare with their neighbours the Pylians. At the close of the 11th century B.C. the Dorians invaded the Peloponnesus, and Elis fell to the share of Oxylus and the Aetolians. These people, amalgamating with the Epeians, formed a powerful kingdom in the north of Elis. After this many changes took place in the political distribution of the country, till at length it came to acknowledge only three tribes, each independent of the others. These tribes were the Epeians, Minyae and Eleans. Before the end of the 8th century B.C., however, the Eleans had vanquished both their rivals, and established their supremacy over the whole country. Among the other advantages which they thus gained was the right of celebrating the Olympic games, which had formerly been the prerogative of the Pisatans. The attempts which this people made to recover their lost privilege, during a period of nearly two hundred years, ended at length in the total destruction of their city by the Eleans. From the time of this event (329 B.C.) till the Peloponnesian War, the peace of Elis remained undisturbed. In that great contest Elis sided at first with Sparta; but that power, jealous of the increasing prosperity of its ally, availed itself of the first pretext to pick a quarrel. At the battle of Mantinea (418 B.C.) the Eleans fought against the Spartans, who, as soon as the war came to a close, took vengeance upon them by depriving them of Triphylla and the towns of the Acroea. The Eleans made no attempt to re-establish their authority over these places, till the star of Thebes rose in the ascendant after the battle of Leucratia (371 B.C.). It is not unlikely that they would have effected their purpose had not the Arcadian confederacy come to the assistance of the Triphyllans. In 366 B.C. hostilities broke out between them, and though the Eleans were at first successful, they were soon overpowered, and their capital very nearly fell into the hands of the enemy. Unable to make head against their opponents, they applied for assistance to the Spartans, who, perceiving Arcadia, and forced the Arcadians to recall their troops from Elis. The general result of this war was the restoration of their territory to the Eleans, who were also again invested with the right of holding the Olympic games. During the Macedonian supremacy in Greece they sided with the victors, but refused to fight against their countrymen. After the death of Alexander they renounced the Macedonian alliance. At a subsequent period they joined the Aetolian League, but persistently refused to identify themselves with the Achaenians. When the whole of Greece fell under the Roman yoke, the sanctity of Olympia secured for the Eleans a certain amount of indulgence. The games still continued to attract to the country large numbers of strangers, until they were finally put down by Theodosius in 394, two years previous to the utter destruction of the country by the Gothic invasion under Alaric. In later times Elia fell successively into the hands of the Franks and the Venetians, under whose rule it recovered to some extent its ancient prosperity. By the latter people the province of Belvedere on the Peneus was called, in consequence of its fertility, "the milch cow of the Morea."

ELIS, the chief city of the ancient Greek district of Elia, was situated on the river Peneus, just where it passes from the mountainous district of Acroea into the champaign below. At one time it was called Oenea, a name also given by Pausanias to Athens. In 471 B.C. it received a great extension by the incorporation (synoecism) of various small hamlets, whose inhabitants took up their abode in the city. Up to this date it only occupied the ridge of the hill now called Kalamoki, to the south of the Peneus, but afterwards it spread out in several suburbs, and even to the other side of the stream. As all the athletes who intended to take part in the Olympic games were obliged to undergo a month's training in the city, its gymnasia were among its principal institutions. They were three in number—"the Xystos," with its avenues of plane-trees, its plemithor or wrestling-place, its altars to Heracles, to Eros and Anteros, to Demeter and Kore (Cora), and its cenotaph of Achilles; the "Tetragonon," appropriated to boxing exercises; and the "Malgia," in the interior of which was a hall or council chamber called the "Heptagonia." The memorable contest between the Pisatans and the Eleans was fought at this town. The market-place was of the old-fashioned type, with porticoes at intervals and paths leading between them. It was called the Hippodrome because it was commonly used for exercising horses. Among the other objects of interest were the temple of Artemis Philmira; the Hellanodiceaon, or office of the Hellanodiceae; the Corcyrean Hall, a building in the Dorian style with two façades, built of spoils from Corcyra; a temple of Apollo Acusius; a temple of Silenus; an ancient structure supported on oaken pillars and reputed to be the burial-place of Oxylus; the building where the sixteen women of Elia were wont to weave a robe for the statue of Hera at Olympia; the temple of Aphrodite, with a statue of the goddess by Phidias, a Urania with a tortoise beneath her foot, and by Scopas as Pandemos, riding on a goat; and the shrine of Dionysus, whose festival, the Thyiia, was yearly celebrated in the neighbourhood. On the acropolis was a temple of Athena, with a gold and ivory statue by Phidias. The history of the town is closely identified with that of Oxyrus, the leader of the Aetolians, whose statue stood in the market-place. In 390 B.C. it was occupied by Agis, king of Sparta. The acropolis was fortified in 312 by Telephorus, the admiral of Antigonus, but it was shortly afterwards dismantled by Philomel, another of his generals. A view of the site is given by Stanhope. It is now called Palaiopolis. No traces of any buildings can be identified, the only remains visible dating from Roman times.

See Pausanias vi. 23-26; J. Spencer Stanhope, Olympia and Elis (1856); W. M. Leake, Morea (1830); E. Curtius, Peloponnesus (1851-1852); Schiller, Sponde und Staat Griechenlandes; C. Burian, Geographie von Griechenland (1868-1872); P. Gardner, "The Coins of Elis," in Num. Chron. (1879).

ELIS, PHILOSOPHICAL SCHOOL OF. This school was founded by Phaedo, a pupil of Socrates. It existed for a very short time and was then transferred to Eretria, where it became known as the Eretrian school. Its chief teachers were Dositheus, Molus, Moschus and Pleistinus (see PHAEDO and MENEDEMUS).
66,182 in 1900. The town is regularly built, with wide streets, some of them lined with trees, and is a wealthy town, which has become an industrial centre for the region especially on account of its steam flour-mills, in which it is second only to Odessa, its distilleries, mechanical workshops, tobacco and tallow factories and brickworks. It is an important centre for trade in cereals and flour for export, and in sheep, cattle, wool, leather and timber. Five fairs are held annually. It has a military school, a first-class meteorological station and a botanical garden. The town was founded in 1754 and named after the empress Elizabeth. The fortifications are now decayed.

ELISAVETPOL, a government of Russia, Transcaucasian, having the governments of Tiflis and Daghestan on the N., Baku on the E., and Erivan and Tiflis on the W. and Persia on the S. Area, 16,721 sq. m. It includes: (a) the southern slope of the main Caucasus range in the north-east, where Bazar-duzui (14,770 ft.) and other peaks rise above the snow-line; (b) the arid and unproductive steppes beside the Kura, reaching 1000 ft. of altitude in the west and sinking to 100-200 ft. in the east, where irrigation is necessary; and (c) the northern slopes of the Transcaucasian escarpment and portions of the Armenian plateau, which is intersected by its western boundary, the lake Gok-chi, by chains of mountains consisting of trachytes and various crystalline rocks, and reaching 12,845 ft. in Mount Kapujik. Elsewhere the country has the character of a plateau, 7000 to 8000 ft. high, deeply troughed by tributaries of the Aars. All varieties of climate are found from that of the snow-clad peaks, Alpine meadows, and stony deserts of the high levels, to that of the hill slopes, clothed with gardens and vineyards, and of the arid Caspian steppes. Thus, at Shusha, on the plateau, at an altitude of 3680 ft., the average temperatures are: year 49°, January 26°, July 66°, annual rainfall, 26.4; while at Elisavetpol, in the valley of the Kura, they are: year 55°, January 32°-2, July 77° and rainfall only 10-3 in. Nearly one-fifth of the surface is under forests.

The population which was 885,379 in 1897 (only 392,124 women; 54,139 urban), and was estimated at 953,300 in 1906, consists chiefly of Tatars (56%) and Armenians (33%). The remainder are Kurds (4-7%), Russians and a few Germans, Jews, Kurds, Udris and Tatars. Peasants form the great bulk of the inhabitants. Some of the Tatars and the Kurds are nomadic. Wheat, maize, barley, oats and rye are grown, also rice. Cultivation of cotton has begun, but the rearing of silkworms is of old standing, especially at Nukha (1650 tons of cocoons on the average are obtained every year). Nearly 8000 acres are under vines, the yield of wine averaging 82½ million gallons annually. Gardening reaches a high standard of perfection. Liquorice root is obtained to the extent of about 35,000 tons annually. The rearing of live-stock is largely carried on on the steppes. Copper, magnetic iron ore, cobalt and a small quantity of naphtha are extracted, and nearly 10,000 persons are employed in manufacturing industry—copper works and silk-mills. Carpet-weaving is widely spread. Owing to the Transcaucasian railway, which crosses the government, trade, both in the interior and with Persia, is very brisk. The government is divided into eight districts, Elisavetpol, Aresh, Jebrail, Jevanshirt, Kazakh, Nukha, Shusha and Zangezur. The only towns, besides the capital, are Nukha (24,811 inhabitants in 1897) and Shusha (23,415).

ELISAVETPOL (formerly Ganja), alternative names being KENJEE and KANGA), a town of Russia, capital of the government of the same name, 118 m. by rail S.E. of Tiflis and 38 m. from the railway, at an altitude of 1446 ft. Pop. (1873) 15,433; (1897) 33,091. It is a very old town, which changed hands between Persians, Khazars and Arabs even in the 7th century, and later fell into the possession of Mongols, Georgians, Persians and Turks successively, until the Russians took it in 1804, when the change of name was made. It is a badly built place, with narrow streets and low-roofed, windowless houses, and is situated in a very unhealthy locality, but has been much improved, a new European quarter having been built on the site of the old fortress (erected by the Turks in 1717-1724). The inhabitants are chiefly Tatars and Armenians, famed for their excellent gardening, and also for silkworm breeding. It has a beautiful mosque, built by Shah Abbas of Persia in 1610; and a renowned "Green Mosque" amidst the ruins of old Ganja, 4 m. distant. The Persian poet, Shah Nizam (Nizam-ed-Din), was born here in 1141, and is said to have been buried (1205) close to the town. The Persians were defeated by the Russians under Paskevich outside this town in 1826.

ELISHA (a Hebrew name meaning "God is deliverance"), in the Bible, the disciple and successor of Elijah, was the son of Shaphat of Abel-meholah in the valley of the Jordan. He was symbolically elected to the prophetic office of Elijah some time during the reign of Ahab (1 Kings xix. 19-21), and he survived until the reign of Joash. His career thus appears to have extended over a period of nearly sixty years. The relation between Elijah and Elisha was of a particularly close kind, but the difference between them is much more striking than the resemblance. Elijah is the prophet of the wilderness, wandering, rugged and austere; Elisha is the prophet of civilized life, of the city and the court, with the dress, manners and appearance of ordinary "good citizens." Elisha is the messenger of vengeance—sudden, fierce and overwhelming; Elisha is the messenger of mercy and restoration. Elisha's miracles, with few exceptions, are works of wrath and destruction; Elisha's miracles, with but one notable exception, are works of beneficence and healing. Elisha is the "prophet as fire" (Eccles., xviii. 1), an abnormal agent working for exceptional ends; Elisha is the "holy man of God whichpasseth by us continually" (2 Kings iv. 9), mixing in the common life of the people.

It is impossible to draw up a detailed chronology of his life. In most of the events narrated no further indication of time is given than by the words "the king of Israel," the name not being specified. There are some instances in which the order of time is obviously the reverse of the order of narrative, and there are other grounds for concluding that the narrative as we now have it is confused and incomplete. This may serve not only to explain the chronological difficulties, but also to throw some light on the altogether exceptional character of the miraculous element in Elisha's history. On the literary questions, see further KInos.

Not only are Elisha's miracles very numerous, even more so than those of Elijah, but they stand in a peculiar relation to the man and his work. With all the other prophets the primary function is spiritual teaching; miracles, even though numerous and many of them symbolical like Elisha's, are only accessory. With Elisha, on the other hand, miracles seem the principal function, and the teaching is altogether subsidiary. An explanation of the superabundance of miracles in Elisha's life is suggested by the fact that several of them were merely repetitions or doubles of those of his predecessor. Such were: his first miracle, when, returning across the Jordan, he made a dry path for himself in the same manner as Elijah (2 Kings ii. 14); the increase of the widow's pot of oil (iv. 1-7); and the restoration of the son of the woman of Shunem to life (iv. 18-37). The theory that stories from the earlier life have been imported by mistake into the later, even if tenable, applies only to threes of the miracles, and leaves explained a much larger number which are not only not repetitions of those of Elijah, but have an entirely opposite character. The healing of the water of Jericho by putting salt into it (ii. 19-22), the provision of water for the army of Jehoshaphat in the arid desert (iii. 6-20), the neutralizing by meal of the poison in the potage of the famine-stricken sons of the prophets at Jericho (iv. 38-41), the healing of Naaman the Syrian (v. 1-19), and the recovery of the iron axehead that had sunk in the water (vi. 1-7), are all instances of the beneficence which was the general characteristic of Elisha's wonder-working activity in contrast to that of Elijah. Another miracle of the same class, the feeding of a hundred men with twenty loaves so that something was left over (iv. 42-44), deserves mention as the most striking though not the only instance of a resemblance between the work of Elisha and that of Jesus (Matt. xiv. 13-21). The one distinct exception to the general beneficence of Elisha's activity—the
destruction of the forty-two children who mocked him as he was going up to Bethel (2 Kings ii. 23-25)—presents an ethical difficulty which is scarcely removed by the suggestion that the narrative has lost its original invader particulars which would have shown the real enormity of the children’s offence. We may prefer to imagine that among the homely stories told of him was one which had for its main object the inculcation of respect for one’s elders. The leprosy brought upon Gehazi (v. 20-27), though a miracle of judgment, scarcely belongs to the same class as the other; and it will be observed that Gehazi’s subsequent relations with the court (viii. 1-6) ignore the disease, a fatal hindrance to intercourse. Further, the healing of Naaman (alluded to in Luke iv. 27) presupposes peaceful relations between the court and the Syrians, with which, however, contrast ch. vi. The wonder-working power of Elisha is represented as continuing even after his death. As the feeding of the hundred men and the cure of leprosy connect his work with that of Jesus, so the story that a dead man who was cast into his sepulchre was brought to life by the mere contact with his bones (2 Kings xii. 21, cf. Exclus. xiviii. 12-14) is the most striking instance of an analogy between his miracles and those recorded of medieval saints. Stanley (Church of Jerusalem, 4th ed., ii. 276) in reference to this has remarked that “in the life of the prophet, Elisha has been associated with medical and ecclesiastical miracles almost disappears.”

The place which Elisha filled in contemporary history was one of great influence and importance, and several narratives testify to his great reputation in Israel. On one occasion, when he delivered the army that had been brought out against Moab from a threatened dearth of water (2 Kings iii. 6), he planned to test the loyalty of the army by a trick. When the “king of Syria” was informed that “Elisha, the prophet that is in Israel, telleth the king of Israel the words that thou speakest in thy bed-chamber,” he at once sent an army to take him captive in Dothan. At Elisha’s prayer the terrified servant beheld an army of horses and chariots of fire surrounding the place. At the appearance of the horses and chariots of fire, the eyes of the servants were struck blind, and in this state they were led by Elisha to Samaria, where their sight was restored. Their lives were spared at the command of the prophet, and they returned home so impressed that their incursions thenceforward ceased (vi. 8-23). This is immediately followed by the siege of Samaria by Benhadad which caused a famine of the severest kind. The calamity was imputed by the “king of Israel” to the influence of Elisha, and he ordered the prophet to be immediately put to death. Forewarned of the danger, Elisha ordered the messenger who had been sent to slay him to be detained at the door, and, when, immediately afterwards, the king himself came (“messenger” in vi. 33 should rather be king), predicted a great plenty within twenty-four hours. This was fulfilled by the flight of the Syrian army under the circumstances stated in ch. vii. After the episode with regard to the woman of Shunem (viii. 1-6), which is out of its chronological order, Elisha is represented as at Damascus (viii. 7-15). The reverence with which the foreign monarch Benhadad addressed Elisha deserves to be noted as showing the extent of his power. In sending to know the issue of his illness, the king caused himself to be styled “thy son Benhadad.” Equally remarkable is the very ambiguous nature of Elisha’s reply (viii. 10). The most important interference of Elisha in the history of his country constituted the fulfilment of the third of the commands laid upon Elisha. The work of anointing Jehu to be king over Israel was performed by deputy (ix. 1-3). During the forty-five years which the chronological scheme allows for the reigns of Jehu and Jehoahaz the narratives contain no notice of Elisha, but from the circumstances of his death (xiii. 14-21) it is clear that he had continued to enjoy the esteem of the dynasty which he had helped to found. Joash, the grandson of Jehu, waited on him on his deathbed, and addressed him in the words which he himself had used to Elisha: “My father, my father, the chariot of Israel and the horsemen thereof” (cf. ii. 12). By the result of a symbolic discharge of arrows he informed the king of his coming success against Syria, and immediately thereafter he died. The explicit statement that he was buried completes the contrast between him and his greater predecessor.

The narrative of Episode iv. 13-27, where “the prophet appears as on friendly terms with the king, and possessed of influence at court (e.g. 2 Kings iv. 13, vi. 9, vi. 21, compared with xiii. 14), plainly belong to the time of Jehu’s dynasty, though they were stated before the building of the house of Omri. We can distinguish portions of an earlier material. The inclusion of the translation of Naaman (iv. 1-7? 38-44); iv. vii. 1-12?) Here Elisha appears as the head of the prophetical gilds, having his familiar residence at Gilgal. Another circle, which presupposes the accession of the house of Jehu, places him at Dothan or Carmel, and represents him as a being of almost superhuman dignity. Here there is an obvious parallelism with the history of Elijah, especially with his ascension (cf. 2 Kings vi. 17 with ii. 11; xiii. 14 with ii. 12); and it is to this group of narratives that the ascension of Elijah forms the introduction (Robertson Smith, Ency. Brit., 9th ed., art. Kings, vol. xiv. p. 186). This twofold representation finds a parallel in the narratives of Samuel, whose history and the conditions reflected therein are analogous to that of Elisha.

Elisha is canonized in the Orthodox Eastern Church, his festival being on the 14th of June, under which date his life is entered in the Acta sanctorum.

See especially, W. R. Smith, Prophets of Israel (Index, s.n.), and the literature to Elisha; Kings, Books of: Prophet.

(W. R. S.; S. A. C.)

ELISHA BEN ABUYAH (c. a.d. 100), a unique figure among the Palestinian Jews of the first Christian century. He was born before the destruction of the Temple (which occurred in a.d. 70) and survived into the 2nd century. It is not easy to decide as to his exact attitude towards Judaism. That he refused to accept the current rabbinical views is certain, though the Talmud cites his legal decisions. Modern authorities believe that he was a Gnostic; but while it is certain that he was a Christian, it is possible that he was simply a Sadducee, and thus an opponent not of Judaism but of Pharisaism. His disciple, the famous Phraeas Melí, remained his steadfast friend, and his efforts to reclaim his former master are among the most pathetic incidents in the Talmud. In later ages Elisha (aber “the other,” as he was named) was regarded as the type of a heretic whose pride of intellect betrayed him into infidelity to law and morals. Without much appropriateness Elisha has been sometimes described as the “Faust of the Talmud.”

(1. A.)

ELIXIR (from the Arabic al-iksir, probably an adaptation of the Gr. ἵππος, a powdered used for drying wounds, from ἱππός, dry), in alchemy, the medium which would effect the transmutation of base metals into gold; it probably included all such substances—vapours, liquids, &c.—and had a wider meaning than the philosopher’s stone. The same term, more fully elixir philosophorum, is an alteration to remove from Elisha the suggestion of an untruth.

The Gilgal of Elisha is near the Jordan—comp. vi. 1 with iv. 38, cf. Ezek. 47:12—and cannot be other than the great sanctuary 2 m. S.W. of the Jordan, of which we are told to have been situated in the Onomastica. It is true that in 2 Kings ii. 1 Bethel seems to lie between Gilgal and Jericho; but v. 25 shows that Gilgal was not originally represented as Elisha’s residence in this narrative, which belongs to the Carmel-Dothan series. On the other hand, for the identification with the Gilgal (Gilgal) S.W. of Philistia, see O. A. Smith, Ency. Bib. (s.v. Gilgal); Burney, op. cit., p. 264; Skinner, Century Bible: Kings, p. 278.
ELIZABETH (1533–1603), queen of England and Ireland, born on Sunday the 7th of September 1533, and, like all the Tudors except Henry VII., at Greenwich Palace, was the only surviving child of Henry VIII. by his second queen, Anne Boleyn. With such a mother and with Cramer as her godfather she represented from her birth the principle of revolt from Rome, but the opponents of that movement attached little importance to her advent into the world. Charles V.’s ambassador, Chapuys, hardly deigned to mention the fact that the king’s amie had given birth to a daughter, and both her parents were bitterly disapproved of by her sex. She was, however, given precedence over Mary, her elder sister by sixteen years, and Mary never forgave the infant’s offence. Even this dubious advantage only lasted three years until her mother was beheaded, and by a much more serious freak on Henry’s part “divorced.” Elizabeth has been censured for having made no effort in later years to clear her mother’s name; but no vindication of Anne’s character could have rehabilitated Elizabeth’s legitimacy. Her mother was not “divorced” for her alleged adultery, because that crime was no ground for divorce by Roman or English canon law. The marriage was declared invalid ab initio either on the ground of Anne’s precontract with Lord Percy or more probably on the ground of the affinity established between Henry and Anne by Henry’s previous relations with Mary Boleyn.

Elizabeth thus lost all hereditary title to the throne, and her early years of childhood can hardly have been happier than Mary’s. Boleyn’s death was her legitimacy ever legally established; but after Jane Seymour’s death, when Henry seemed likely to have no further issue, she was by act of parliament placed next in order of the succession after Edward and Mary and their issue; and this statutory arrangement was confirmed by the will which Henry VIII. was empowered by statute to make. Queen Catherine Parr introduced some humanity into Henry’s household, and Edward and Elizabeth were well and happily educated together, principally at old Hatfield House, which is now the marquess of Salisbury’s stables. They were there when Henry’s death called Edward VI. away to greater dignities, and Elizabeth was left in the care of Catherine Parr, who married in indecent haste Thomas, Lord Seymour, brother of the protector Somerset.

This unprincipled adventurer, even before Catherine’s death in September 1548, paid indulgent attentions to Elizabeth. Any attempt to marry her without the council’s leave would have been treason on his part and would have deprived Elizabeth of her congenial right to the succession. Accordingly, when Seymour’s other misbehaviour led to his arrest, his relations with Elizabeth were made the subject of a very trying investigation, which gave Elizabeth her first lessons in the feminine arts of self-defence. She proved equal to the occasion, partly because she was in all probability innocent of anything worse than a qualified acquiescence in Seymour’s improprieties and a girlish admiration for his handsome face. He or his tragic fate may have touched a deeper chord, but it was carefully concealed; and although in later years Elizabeth seems to have cherished his memory, and certainly showed no love for his brother’s children, at the time she only showed resentment at the indignities inflicted on herself.

For the rest of Edward’s reign Elizabeth’s life was less tempestuous. She hardly rivalled Lady Jane Grey as the ideal Puritan maiden, but she swam with the stream, and was regarded as foil to her stubborn Catholic sister. She thus avoided the enmity and the still more dangerous favour of Northumberland; and some unknown history lies behind the duke’s preference of the Lady Jane to Elizabeth as his son’s wife and his own puppet for the throne. She thus escaped shipwreck in his crazy vessel, and rode by Mary’s side in triumph into London on the failure of the plot. For a time she was safe enough; she would not renounce her Protestantism until Catholicism had been made the law of the land, but she followed Gardiner’s advice to her father when he said it was better that he should make the law his will than try to make his will the law. As a presumptive ruler of England she was, like Cecil, and for that matter the future archbishop Parker also, too shrewd to commit herself to passive or active resistance to the law; and they merely anticipated Hobbes in holding that the individual committed no sin in subordinating his conscience to the will of the state, for the responsibility for the law was not his but the state’s. Their position was well enough understood in those days; it was known that they were heretics at heart, and that when their turn came they would once more overthrow Catholicism and expect a similar submission from the Catholics.

It was not so much Elizabeth’s religion as her nearness to the throne and the circumstances of her birth that endangered her life in Mary’s reign. While Mary was popular Elizabeth was safe; but as soon as the Spanish marriage project had turned away English hearts Elizabeth inevitably became the centre of plots and the hope of the plotters. Had not Lady Jane still been alive to take off the edge of Mary’s indignation and suspicion Elizabeth might have paid forfeit for Wyatt’s rebellion with her life instead of imprisonment. She may have had interviews with French agents who helped to foment the insurrection; but she was strong and wary enough to avoid Henry II.’s, as she had avoided Northumberland’s, toils; for even in case of success she would have been the French king’s puppet, placed on the throne, if at all, merely to keep it warm for Henry’s prospective daughter-in-law, Mary Stuart. This did not make Mary Tudor any more friendly, and although the story that Elizabeth favoured Courtenay and that Mary was jealous is a ridiculous fiction, the Spaniards cried loud and long for Elizabeth’s execution. She was sent to the Tower in March 1554, but few Englishmen were fanatic enough to want a Tudor beheaded. The great nobles, the Howards, and Gardiner would not hear of such a proposal; and all the efforts of the court throughout Mary’s reign failed to induce parliament to listen to the suggestion that Elizabeth should be deprived of her legal right to the succession.

She had only to bide her time while Mary made straight her successor’s path by uprooting whatever affection the English people had for the Catholic faith, Roman jurisdiction and Spanish alliance. The Protestant martyrs and Calais between them removed all the alternatives to an insular national English policy in church and state; and no sovereign was better qualified to lead such a cause than the queen who ascended the throne amid universal, and the Spaniards thought indecent, rejoicings at Mary’s death on the 17th of November 1558. “Mere English” she boasted of being, and after Englishmen’s recent experience there was no surer title to popular favour. No sovereign since Harold had been so purely English in blood; her nearest foreign ancestor was Catherine of France, the widow of Henry V., and no English king or queen was more superbly insular in character or in policy. She was the unmistakable child of the age so far as Englishmen shared in its characteristics, for with her English aims she combined some Italian methods and ideas. “An Englishman Italianate,” ran the current jingle, “is a devil incarnate,” and Elizabeth was well versed in Italian scholarship and statecraft. Italians, especially Bernardo Ochino, had given her religious instruction, and the Italians who rejected Catholicism usually adopted far more advanced forms of heresy than Lutheranism, Zwingleianism, or even Calvinism. Elizabeth herself patronized Giacomo Acontio, who thought dogma a “stratagemata Sataane,” and her last favourite, Essex
was accused of being the ringleader of “a damnable crew of atheists.” A Spanish ambassador early in the reign thought that Elizabeth’s own religion was equally negative, though she told him she agreed with nearly everything in the Augsburg Confession. She was probably not as liberty to say what she really thought, but she made up by saying a great many things which she did not mean. It is clear enough that, although, like her father, she was fond of ritual, she was absolutely devoid of the religious temperament, and that her ecclesiastical preferences were dictated by political considerations.

She was sincere enough in her dislike of Roman jurisdiction and of Calvinism; a daughter of Anne Boleyn could have little affection for a system which made her a bastard, and all monarchs agreed at heart with James I’s aphorism about “no bishop, no king.” It was convenient, too, to profess Lutheran sympathies, for Lutheranism was now an established, monarchical and comparatively respectable religion, very different from the Calvinism against which monarchs directed the Counter-reformation from political motives. Lutheran dogma, however, had few adherents in England, though its political theory coincided with that of Anglicanism in the 16th century. The compromise that resulted from these conflicting forces suited Elizabeth very well; she had little dislike of Catholics who repudiated the papacy, but she was forced to rely mainly on Protestants, and had little respect for any form of ecclesiastical self-government. She valued uniformity in religion, not as a safeguard against heresy, but as a guarantee of the unity of the state. She respected the bishops only as supporters of her throne; and, although the well-known letter beginning “Proud Pretate” is an 18th-century forgery, it is hardly a travesty of Elizabeth’s attitude.

The outlines of her foreign policy are sketched elsewhere (see English History), and her courtships were diplomatic. Contemporary gossip, which was probably justified, said that she was dowered from maternity by a physical defect; and her stepmother heard that Mary queen of Scots had refused to marry a son is the most womanly thing recorded of Elizabeth. Her features were as handsome as Mary’s, but she had little fascination, and in spite of her many suitors no man lost his head over Elizabeth as men did over Mary. She was far too masculine in mind and temperament, and her extravagant addiction to the outward trappings of femininity was probably due to the absence or atrophy of deeper feminine instincts. In the same way the impossibility of marriage made her all the freer with her flirtations, and she carried some of them to lengths that scandalized a public unconscious of Elizabeth’s security. She had every reason to keep them in the dark, and to convince other courts that she could and would marry if the provocations were sufficient. She could not marry Philip II., but she held out hopes to more than one of his Austrian cousins whenever France or Mary Stuart seemed to threaten; and later she encouraged two French princes when Philip had lost patience with Elizabeth and made Mary Stuart his protégée. Her other suitors were less important, except Leicester, who appealed to the least intellectual side of Elizabeth and was always a cause of distraction in her policy and her ministers.

Elizabeth was terribly handicapped by having no heirs of her body and no obvious English successor. She could not afford to recognize Mary’s claim, for that would have been to alienate the Protestants, double the number of Catholics, and, in her own phrase, to spread a winding-sheet before her eyes; for all would have turned to the rising sun. Mary was dangerous enough as it was, and no one would willingly make his rival his heir. Elizabeth could hardly be expected to go out of her way and ask parliament to repeal its own acts for Mary’s sake; probably it would have refused. Nor was it personal enmity on Elizabeth’s part that brought Mary to the block. Parliament had long been ferociously demanding Mary’s execution, not because she was guilty but because she was dangerous to the public peace. She alone could have given the Spanish Armada any real chance of success; and as the prospect of invasion loomed larger on the horizon, fiercer grew the popular determination to remove the only possible centre of a domestic rising, without which the external attack was bound to be a failure. Elizabeth resisted the demand, not from compassion or qualms of conscience, but because she dreaded the responsibility for Mary’s death. She wished Paulet would manage the business on his own account, and when at last her signature was extorted she made a scapegoat of her secretary Davison who had the warrant executed.

The other great difficulty, apart from the succession, with which Elizabeth had to deal arose from the exuberant aggressive-ness of England, which she could not, and perhaps did not want to, repress. Religion was not really the cause of her external dangers, for the time had passed for crusades, and no foreign power seriously contemplated an armed invasion of England for religion’s sake. But no state could long tolerate the affronts which English seamen offered Spain. The common view that the British Empire has been won by purely defensive action is not tenable, and from the beginning of her reign Englishmen had taken the offensive, partly from religious but also from other motives. They were determined to break up the Spanish monopoly in the new world, and in the pursuit of this endeavour they were led to challenge Spain in the old. For nearly thirty years Philip put up with the capture of his treasure-ships, the raiding of his colonies and the open assistance rendered to his rebels. Only when he had reached the conclusion that his power would never be secure in the Netherlands or the New World until England was conquered, did he despatch the Spanish Armada. Elizabeth delayed the breach as long as she could, probably because she knew that war meant taxation, and that taxation was the most prolific parent of revolt.

With the defeat of the Spanish Armada Elizabeth’s work was done, and during the last fifteen years of her reign she got more out of touch with her people. That period was one of gradual transition to the conditions of Stuart times; during it practically every claim was put forward that was made under the first two Stuarts either on behalf of parliament or the pre-rogative, and Elizabeth’s attitude towards them was hardly distinguishable from James I’s. But her past was in her favour, and so were her sex and her Tudor tact, which checked the growth of discontent and made Essex’s rebellion a ridiculous farce.

He was the last and the most wilful but perhaps the best of her favourites, and his tragic fate deepened the gloom of her closing years. The loneliness of a queen who had no husband or children and no relatives to mention must at all times have been oppressive; it grew desolating in old age after the deaths of Leicester, Walsingham, Burghley and Essex, and Elizabeth died, the last of her race, on the 24th of March 1603.

Bishop Creighton’s Queen Elizabeth (1860) is the best biography; that of R. H. C. Davis is the most accurate (Twelve Subjects, 1892); Lucy Akin, Memoirs of the Court of Queen Elizabeth (1818); and T. Wright, Queen Elizabeth and her Times (1838). See also A. Jessopp’s article in the Dict. Nat. Biog. (A. F. P.)

ELIZABETH [PETROVNA] (1759-1762), EMPRESS OF RUSSIA, the daughter of Peter the Great and Martha Skovoronskaya, born at Kolomenskoye, near Moscow, on the 18th of December 1759. Even as a child her parts were good, if not brilliant, but unfortunately her education was both imperfect and desultory. Her father had no leisure to devote to her training, and her mother was too illiterate to superintend her studies. She had a French governess, however, and at a later day picked up some Italian, German and Swedish, and could converse in these languages with more fluency than accuracy. From her earliest years she delighted everyone by one of her extraordinary beauty and vivacity. It was Peter’s intention to marry his second daughter to the young French king Louis XV., but the pride of the Bourbons revolted against any such alliance. Other conunbrial speculations founded on the personal dislike of the princess for the various suitors proposed to her, so that on the death of her mother (May 1727) and the departure to Holstein of her beloved sister Anna, her only remaining near relation, the princess found herself at the age of eighteen practically her own mistress. So long as Menshikov remained in power, she was treated with liberality and distinction by the government of Peter II., but the Dolgorukis, who supplanted Menshikov and hated the memory of Peter the Great, practically banished Peter’s daughter
Elizabeth, her diplomatic awareness of the pathies of d'etat of Sweden, was immediately impressed by the Franco-Prussian war, and her diplomatic skills were crucial in the negotiations that followed. Elizabeth was a lover of Alexius Shubin, a sergeant in the Semenovsky Guards, and her banishment to Siberia, minus his tongue, by order of the empress, was a blow to her. During the reign of her cousin Anne (1730–1740), Elizabeth befriended herself as much as possible; but under the regency of Anne Leopoldovna, she was compelled to maintain her political balance. The idea seems to have been first suggested to her by the French ambassador, La Chêtrardie, who was plotting to destroy the Austrian influence in the Russian court. She was a part of the revolution which placed the daughter of Peter the Great on the Russian throne. As a matter of fact, beyond lending the tsesarevna 2000 ducats, she took no part whatever in the actual coup d'état, which was quite a surprise to her and to everybody else.

The merit of that singular affair belonged to Elizabeth alone. The fear of being imprisoned in a convent for the rest of her life was the determining cause of her irresistible outburst of energy. At midnight on the 6th of December 1741, with a few personal friends, including her physician, Armand lestocq, her chamberlain, Michael Lilienovich Vorontsov, her future husband, Alexius Razumovski, and Alexander Peter Shuvalov, two of the gentlemen of her household, she drove to the barracks of the Preobrazhensky Guards, enlisted their sympathies by a stirring speech, and led them to the Winter Palace, where the regent was residing in absolute security. Harking on the way all the ministers arrested, she seized the regent and her children in their beds, and summoned all the notables, civil and ecclesiastical, to her presence. The news spread quickly, and the whole revolution proceeded that as late as eight o'clock the next morning very few people in the city were aware of it. Thus, at the age of three-and-thirty, this naturally indolent and self-indulgent woman, with little knowledge and no experience of affairs, suddenly found herself at the head of a great empire at one of the most critical periods of its existence. Fortunately for herself, and for Russia, Elizabeth Petrovna, with all her shortcomings, had inherited some of her father's genius for government. She usually kept judgment and her diplomatic tact again and again recall Peter the Great. What in her sometimes seemed irresolution and procrastination, was, most often, a wise suspension of judgment under exceptionally difficult circumstances; and to this may be added that she was ever ready to sacrifice the prejudices of the woman to the duty of the sovereign.

After abolishing the cabinet council system in favour during the rule of the two Annes, and reconstituting the senate as it had been under Peter the Great,—with the chief of the depart- mens under the presidency of the sovereign,—the first care of the new empress was to compose her quarrel with Sweden. On the 23rd of January 1743, direct negotiations between the two powers were opened at Abo, and on the 7th of August 1743 Sweden ceded to Russia all the southern part of Finland east of the river Kymmene, which thus became the boundary between the two states, including the fortresses of Villmanstrand and Fredrikshamn. This triumphant issue was mainly due to the diplomatic ability of the new vice-chancellor, Alexius Bestuzhev-Ryumin (q.v.), whom Elizabeth, much as she disliked him personally, had wisely placed at the head of foreign affairs immediately after her accession. He represented the anti-Franco-Prussian portion of her council, and his object was to bring about an Anglo-Austro-Russian alliance which, at that time, was undoubtedly Russia's proper system. Hence the reiterated attempts of Frederick the Great and Louis XV. to get rid of Bestuzhev, which made the Russian court during the earlier years of Elizabeth's reign the centre of a tangle of intrigue impossible to unravel by those who do not possess the clue to it (see Bestuzhev-Ryumin, Alexius). Ultimately, however, the minister, strong in the support of Elizabeth, prevailed, and his faultless diplomacy, backed by the despatch of an auxiliary Russian corps of 30,000 men to the Rhine, greatly accelerated the peace negotiations which led to the treaty of Aix-la-Chapelle (October 18, 1748).

The great event of Elizabeth's later years was the Seven Years' War. Elizabeth rightly regarded the treaty of Westminster (January 16, 1756), whereby Great Britain and Prussia agreed to unite their forces to oppose the entry into, or the passage through, Germany of the troops of every foreign power, as utterly subversive of the previous conventions between Great Britain and Russia. A by no means unwarrantable fear of the king of Prussia, who was "to be reduced within proper limits," so that "he might be no longer a danger to the empire," induced Elizabeth to accede to the treaty of Versailles, in other words the Franco-Austrian league against Prussia, and on the 17th of May 1757 the Russian army, 85,000 strong, advanced against Königsberg. Neither the serious illness of the empress, which began with a fainting-fit at Tsarskoe Selo (September 19, 1757), nor the fall of Bestuzhev (February 21, 1758), nor the cabals and intrigues of the various foreign powers at St. Petersburg, interfered with the progress of the war, and the crushing defeat of Kunersdorf (August 12, 1759) at last brought Frederick to the verge of ruin. From that day forth he despaired of success, though he was saved for the moment by the jealousies of the Russian and Austrian commanders, which ruined the military plans of the allies. On the other hand, it is not too much to say that, from the end of 1759 to the end of 1761, the unshakable firmness of the Russian empress was the one constraining political force which held together the heterogeneous, incessantly jarring elements of the anti-Prussian combination. From the Russian point of view, Elizabeth's greatness as a statesman consists in her steady appreciation of Russian interests, and her determination to promote them at all hazards. She insisted throughout that the king of Prussia must be rendered harmless to his neighbours for the future, and that the only way to bring this about was to reduce him to the rank of an elector. Frederick himself was quite alive to his danger. "I am at the end of my resources," he wrote at the beginning of 1760, "the continuance of this war means for me utter ruin. Things may drag on perhaps till July, but then a catastrophe must come." On the 21st of May 1760 a fresh convention was signed between Russia and Austria, guaranteeing to the former complete independence of the Spanish Netherlands, andVersailles, guaranteed East Prussia to Russia, as an indemnity for war expenses. The failure of the campaign of 1760, so far as Russia and France were concerned, induced the court of Versailles, on the evening of the 22nd of January 1761, to present to the court of St. Petersburg a despatch to the effect that the king of France by reason of the condition of his dominions absolutely desired peace. On the following day the Austrian ambassador, Esterhazy, presented a despatch of a similar tenor from his court. The Russian empress's reply was delivered to the two ambassadors on the 12th of February. It was inspired by the most uncompromising hostility towards the king of Prussia. Elizabeth would not consent to any pacific overtures until the original object of the league had been accomplished. Simultaneously, Elizabeth ceased to be conveyed to Louis XV. a confidential letter in which she proposed the signature of a new treaty of alliance of a more comprehensive and explicit nature than the preceding treaties between the two powers, without the knowledge of Austria. Elizabeth's object in this mysterious negotiation
seems to have been reconcile France and Great Britain, in
return for which signal service France was to throw all her
forces into the German war. This project, which lacked neither
ability nor audacity, founder upon Louis XV.'s invincible
jealousy of the growth of Russian influence in eastern Europe
and his fear of offending the Porte. It was finally arranged
by the allies that their envoys at Paris should fix the date for the
assembling of a peace congress, and that, in the meantime, the
war against Prussia should be vigorously prosecuted. The
campaign of 1761 was almost as abortive as the campaign of
1760. Frederick acted on the defensive with consummate
skill, and the capture of the Prussian fortress of Kolberg on
Christmas day O.S. 1761, by Rumyantsev, was the sole Russian
success. Frederick, however, was now at the last gasp. On the
6th of January 1762, he wrote to Finkenstein, "We ought now
to think of preserving for my nephew, by way of negotiation,
whatever fragments of my territory we can save from the avidity
of my enemies," which means, if words mean anything, that he
was resolved to seek a soldier's death on the first opportunity.
A fortnight later he wrote to Prince Ferdinand of Brunswick,
"The news of my brother Frederick's death has just reached me,
and I received the news of a great event." The great event
which snatched him from destruction was the death of the Russian
empress (January 5, 1762).

ELIZABETH [AMÉLIE EUGÈNIE] (1837-1898), consort of
Francis Joseph, emperor of Austria and king of Hungary, was
the daughter of Duke Maximilian Joseph of Bavaria and Louisa
Wilhelmina, daughter of Maximilian I. of Bavaria, and was born
on the 24th of December 1837 at the castle of Possenhofen on
Lake Starnberg. She inherited the quick intelligence and
artistic taste displayed in general by members of the Wittelsbach
royal house, and her education was the reverse of conventional.
She accompanied her eccentric father on his hunting expeditions,
becoming an expert rider and dancer, visiting the peasants in
their huts and sharing in rustic pleasures. The emperor of
Austria, Francis Joseph, met the Bavarian ducal family at
Ischl in August 1855, and immediately fell in love with Elizabeth,
then a girl of sixteen, and reported to be the most beautiful
princess in Europe. The marriage took place in Vienna on the
24th of April 1854. In the early days of her married life she
frequently came into collision with Viennese prejudice. Her
attempts to modify court etiquette, and her extreme fondness for
horsemanship and frequent visits to the imperial riding school,
scandalized Austrian society, while her predilection for Hungary
and for everything Hungarian offended German sentiment.
There is no doubt that her influence helped the establishment of
the Ausgleich with Hungary, but outside Hungarian affairs
the empress took small part in politics. She first visited Hungary
in 1857, and ten years later was crowned queen. Her popularity
with the Hungarians remained unchanged throughout her life;
and the crown of Gódiók, presented as a coronation gift, was
one of her favourite residences. Elizabeth's kindness to the
more charitable of royal ladies, and her popularity with her Austrian
subjects was more than restored by her assiduous care for the
wounded in the campaign of 1866. Besides her public benefac-
tions she constantly exercised personal and private charity.
Her eldest daughter died in infancy; Gisela (b. 1856) married
the Prince Leopold of Bavaria; and her youngest daughter
Marie Valerie (b. 1868) married the Archduke Franz Salvator.
The tragic death of her only son, the crown prince Rudolph, in
1889, was a shock from which she never really recovered.
She was also deeply affected by the suicide of her cousin Louis II.
of Bavaria, and again by the fate of her sister Sophia, duchess of
Aalençon, who perished in the fire of the Paris charity bazaar
in 1897. The empress had shown signs of lung disease in 1861,
when she spent some months in Madeira; but she was able to
resume her outdoor sports, and for some years before 1882, when
she had to give up riding, was a frequent visitor on English and
Irish hunting fields. In her later years her dislike of publicity
increased. Much of her time was spent in travel or at the
Achilleon, the palace she had built in the Greek style in Corfu.
She was walking from her hotel at Geneva to the steamer when
she was stabbed by the anarchist Luigi Luccheni, on the 20th of
September 1898, and died of the wound within a few hours. This
aimless and dastardly crime completed the list of mis-
fortunes of the Austrian house, and aroused intense indignation
throughout Europe.

See A. de Burgh, Elizabeth, Empress of Austria, a Memoir (London,
1898); E. Friedmann and J. Paves, Kaiserin Elisabeth (Berlin,
1898); and the anonymous Martyrodom of an Empress (1899),
containing a quantity of court gossip.

ELIZABETH (1596-1662), consort of Frederick V., elector
palatine and titular king of Bohemia, was the eldest daughter
of James I. of Great Britain and of Anne of Denmark, and was
born at Falkland Castle in Fifeshire in August 1596. She
was entrusted to the care of the earl of Lincoln, and after
the departure of the royal family to England, to the countess
of Radnor. She was engaged at the age of 12 to Lord and Lady
Harington at Combe Abbey in Warwickshire. In November
1603 the Gunpowder Plot conspirators formed a plan to seize her
person and proclaim her queen after the explosion, in consequence
of which she was removed by Lord Harington to Coventry.
In 1608 she appeared at court, where her beauty soon attracted
admiration and became the theme of the poets, her suitors
including the dauphin, Maurice, prince of Orange, Gustavus
Adolphus, Philip III. of Spain, and Frederick V., the elector
palatine. A union with the last-named was finally arranged,
spite of the queen's opposition, in order to strengthen the
alliance with the Protestant powers in Germany, and the marriage
took place on the 14th of February 1613 midst great rejoicing
and festivities. The prince and princess entered Heidelberg
on the 17th of June, and Elizabeth, by means of her English annuity,
enjoyed five years of pleasure and of extravagant gaiety to which
the small German court was totally unaccustomed. On the 20th
of August 1618, Frederick, as a leading Protestant prince, was
chosen king by the Bohemians, who deposed the emperor
Ferdinand, then archduke of Styria. There is evidence to
show that his acceptance was instigated by the princess for
that she had any influence in her husband's political career.
She accompanied Frederick to Prague in October 1619, and
was crowned on the 7th of November. Here her unrestrainable
high spirits and levity gave great offense to the citizens. On
the approach of misfortune, however, she showed great courage
and fortitude. She left Prague on the 8th of November 1620,
after the fatal battle of the White Hill, for Kusmir, travelling
thence to Berlin and Wolfenbüttel, finally with Frederick
taking refuge at the Hague with Prince Maurice of Orange.
The help sought from James came only in the shape of useless
embassies and negotiations; the two Palatines were soon
occupied by the Spaniards and the duke of Bavaria; and the
romantic attachment and services of Duke Christian of Brun-
swick, of the 1st earl of Craven, and of other chivalrous young
champions who were inspired by the beauty and grace of the
Queens of England, was now called, availed nothing.
Her residence was at Rheinsberg. At this tribunal, where she
received many English visitors and endeavoured to maintain
her spirits and fortitude, with strained means and in spite of
frequent disappointments. The victories of Gustavus Adolphus
secured no permanent advantage, and his death at Lützen was
followed by that of the elector at Mainz on the 20th of November
1632. Subsequent attempts of the princes to reinstate her
son in his dominions were unsuccessful, and it was not till the
year of Westphalia in 1648 that he regained a portion of them,
the Rhenish Palatinate. Meanwhile, Elizabeth's position in
Holland grew more and more unsatisfactory. The payment
of her English annuity of £12,000 ceased after the outbreak
of the troubles with the parliament; the death of Charles I.
in 1649 put an end to all hopes from that quarter; and the pension

ELIZABETH OF AUSTRIA—ELIZABETH STUART 285.
allowed her by the house of Orange ceased in 1560. Her children, in consequence of disputes, abandoned her, and her eldest son Charles Louis refused her a home in his restored electorate. Nor did Charles II. at his restoration show any desire to receive her in England. Parliament voted her £20,000 in 1666 for the payment of her debts, but Elizabeth did not receive the money, and on the 19th of May 1661 she left the Hague for England, in spite of the king's attempts to hinder her journey, receiving no official welcome on her arrival in London and being lodged at Lord Craven's house in Drury Lane. Charles, however, subsequently granted her a pension and treated her with kindness. On the 8th of February 1662 she removed to Leicester House in Leicester Fields, and died shortly afterwards on the 13th of the same month, being buried in Westminster Abbey. Her beauty, grace and vivacity exercised a great charm over her contemporaries, the enthusiasm for her, however, being probably not merely personal but one inspired also by her misfortunes and by the fact that these misfortunes were incurred in defence of the Protestant cause; later, as the ancestor of the Protestant Hanoverian dynasty, she obtained a conspicuous place in English history.

She had thirteen children—Frederick Henry, drowned at sea in 1629; Charles Louis, elector palatine, whose daughter married Philip, duke of Orleans, and became the ancestress of the elder and Roman Catholic branch of the royal family of England; Elizabeth, abbess and friend of Descartes; Prince Rupert and Prince Maurice, who died unmarried; Louise, abbess; Edward, who married Anne de Gonzaga, "princesse palatine," and had children; Henrietta Maria, who married Count Sigismund Ragotzki, but died childless; Philip and Charlotte, who died childless; Sophia, who married Ernest Augustus, elector of Hanover, and was mother of George I. of England; and two others who died young.

Rait (1904); Bullock, St. Elizabeth's, St. Elizabeth; Carl Ludwig von der Pfalz, by A. Wendland (Bibliothek des literarischen Vereins, 228, Stuttgart, 1902); "Elizabeth Stuart," by J. O. Opel, in Sybel's Historische Zeitschrift, xxiii. 289; Thomas Thomson, Brit. Mus.), E., 138 (14), 122 (12), 118 (40), 119 (18). Important material regarding the princess exists in the MSS. of the earl of Craven, at Combe Abbey.

ELIZABETH [Pauline Elizabeth Ottoline Louise] (1843–) (consort of King Charles I. (q.v.) of Rumania, widely known by her literary name of "Carmen Sylva," born on the 20th of December 1843. She was the daughter of Prince Hermann of Newuied. She first met the future king of Rumania at Berlin in 1861, and was married to him on the 15th of November 1869. Her only child, a daughter, died in 1874. In the Russo-Turkish War of 1877–1878 she devoted herself to the care of the wounded, and founded the Order of Elizabeth (a gold cross on a blue ribbon) to reward distinguished service in such work. She fostered the higher education of women in Rumania, and established societies for various charitable objects. Early distinguished by her excellence as a pianist, organist and singer, she also showed considerable ability in painting and illuminating; but a lively poetic imagination led her to the path of literature, and more especially to poetry, folk-lore and ballads. In addition to numerous original works she put into literary form many of the legends current among the Rumanian peasantry.

"Carmen Sylva," wrote with facility in German, Rumanian, French and English. A few of her voluminous writings, which include poems, plays, novels, short stories, essays, collections of aphorisms, &c., may be singled out for special mention. Her earliest publications were Sappho and Hammerstein, two poems which appeared at Leipzig in 1880. In 1888 she received the Prix Botta, a prize awarded triennially by the French Academy, for her volume of prose aphorisms Les Pensées d'une reine (Paris, 1882), a German version of which is entitled Vom Amboss (Bonn, 1890). Castine Sufetesci, religious meditations in Rumanian (Bucharest, 1888), was also translated into German (Bonn, 1890), under the name of Seden-Gespräche. Several of the works of "Carmen Sylva" were written in collaboration with Mitie Kremnitz, one of her maids of honour, who was born at Greifswald in 1845, and married Dr Kremnitz of Bucharest; these were published between 1881 and 1888, in some cases under the pseudonyms Dito et Idem, and includes the novel Aus zwei Welten (Leipzig, 1884), Anna Boleyn (Bonn, 1886), a tragedy, In der Irre (Bonn, 1888), a collection of short stories, &c. Edeline Vaughan, or Paths of Peril, a novel (London, 1894), and Sweet Hours, poems (London, 1904), were written in English. Among the translations made by "Carmen Sylva" are German versions of Pierre Loti's romance Pêcheur d'îslande, and of Paul de St Victor's dramatic criticisms Les Deux Masques (Paris, 1881–1884); and in particular Thé Bard of the Dimbovita, a fine English version by "Carmen Sylva" and Alma Stretfell of Helene Vacareso's collection of Rumanian folk-songs, &c., entitled Lieder aus dem Dimbovitschazi (Bonn, 1886). The Bard of the Dimbovita was first published in Rumanian, in 1891, and was soon reissued and expanded. Translations from the original works of "Carmen Sylva" have appeared in all the principal languages of Europe and in Armenian.

See Rumania: History; also M. Kremnitz, Carmen Sylva—eine Biographie (Leipzig, 1903) and, for a full bibliography, G. Bengescu, Carmen Sylva—bibliographie et extraits de ses œuvres (Paris, 1904).

ELIZABETH (1635–1650), English princess, second daughter of Charles I., was born on the 28th of December 1635 at St James's Palace. On the outbreak of the Civil War and the departure of the king from London, while the two elder princes accompanied their father, the princess and the infant duke of Gloucester were left under the care of the parliament. In October 1642 Elizabeth sent a letter to the House of Lords begging that her old attendants might not be removed. In July 1644 the royal children were sent to Sir John Danvers at Chelsea, and in 1645 to the earl and countess of Northumberland. After the final defeat of the king they were joined in 1646 by James, and during 1647 paid several visits to the king at Caversham, near Reading, and Hampton Court, but were again separated by James's imprisonment at Carisbrooke Castle. On the 21st of April 1648 James was persuaded to escape by Elizabeth, who declared that were she a boy she would not long remain in confinement. The last sad meeting between Charles and his two children, at which the princess was overcome with grief, and of which she wrote a short and touching account, took place on the 29th of January 1649, the day before his execution. In June she was entrusted to the care of the earl and countess of Leicester at Penshurst, but in 1659, upon the landing of Charles II. in Scotland, the parliament ordered the royal children to be taken for security to Carisbrooke Castle. The princess fell ill from a wetting almost immediately upon her arrival, and died of fever on the 8th of September. She was buried in St Thomas's church at Newport, Isle of Wight, where the initials "E.S." alone marked her grave till 1836, when a monument was erected to her memory by Queen Victoria. The princess's sorrowful career and early death have attracted general interest and sympathy. She was said to have acquired considerable proficiency in Greek, Hebrew and Latin, as well as in Italian and French, and several books were dedicated to her, including the translation of the Electa of Sophocles by Christopher Wase in 1649. Her mild nature and gentleness towards her father's enemies gained her the name of "Temperance."

ELIZABETH [Elisabeth Philippine Marie Hélène of France] (1764–1794), commonly called MADAME ELIZABETH, daughter of Louis the Dauphin and Marie Josephine of Saxony, and sister of Louis XVI., was born at Versailles on the 3rd of May 1764. Left an orphan at the age of three, she was brought up by Madame de Mackau, and had a residence at Montreuil, where she gave many proofs of her benevolent character. She refused all offers of marriage so that she might remain by the side of her brother, whom she loved passionately. At the outset of the Revolution she foresaw the gravity of events, and refused to leave the king, whom she accompanied in his flight on the 20th of June 1792, and with whom she was arrested at Varennes.
ELIZABETH, SAINT—ELIZABETH

She was present at the Legislative Assembly when Louis was suspended, and was imprisoned in the Temple with the royal family. By the execution of the king and the removal of Marie Antoinette to the Conciergerie, Madame Elizabeth was deprived of her companions in the Temple prison, and on the 9th of May 1794 she was herself transferred to the Conciergerie, and haled before the revolutionary tribunal. Accused of assisting the king's flight, of supplying émigrés with funds, and of encouraging the resistance of the royal troops on the 18th of August 1792, she was condemned to death, and executed on the 10th of May 1794. Like her brother, she had all the domestic virtues, and, as was to be expected of a sister of Louis XVI, she was in favour of absolutist principles. Hers was one of the most touching tragedies of the Revolution; she perished because she was the sister of the king.

The Mémoires de Madame Elizabeth (Paris, 1858), by F. de Barghon and Fort-Kion, are of doubtful authenticity; and the collection of letters and documents published in 1865 by F. Feuillet de Conches must be used with caution (see the bibliographical note to the article MARIE ANTOINETTE). See Le Comte A. F. Ferrand, Histoire de Madame Elizabeth (1814, containing 94 letters; 2nd ed., 1851, containing additional letters, but correspondence mutilated); Du Fresne de Beaufort, Lettres sur Madame Elizabeth (Paris, 1864); A. de Beauchese, Vie de Madame Elizabeth (1860); La comtesse d'Arvay, Madame Elisabeth (1866); Madame d'Arvor, Madame Elizabeth (Paris, 1898); and on Mrs. Maxwell-Stuart, Madame Elizabeth of France (1908).

ELIZABETH, SAINT (1207-1231), daughter of Andrew II., king of Hungary (d. 1235), by his first wife, Gertrude of Andechs-Meran (d. 1213), was born in Pressburg in 1207. At four years of age she was betrothed to Louis IV., landgrave of Thuringia, and conducted to the Wartburg, near Eisenach, to be educated under the direction of his parents. In spite of her decidedly worldly surroundings at the Thuringian court, she evinced from the first an aversion from even the most innocent pleasures, and stimulated by the example of her mother's sister, St Hedwig, wife of Henry VI., duke of Silesia-Breslau, devoted her whole life to religion and to works of charity. She was married at the age of fourteen, and acquired such influence over her husband that he adopted her point of view and zealously assisted her in all her charitable endeavours. Accepted by Louis as the ideal model celebrated in German art, Louis at first desired to curtail her excessive charities, and forbad her unbounded gifts to the poor. One day, returning from hunting, he met his wife descending from the Wartburg with a heavy bundle filled with bread. He sternly bade her open it; she did so, and saw nothing but a mass of red roses. The miracle completed his conversion. On the death of Louis "the Saint" in 1227, Elizabeth was deprived of the regency by his brother, Henry Kaspe IV. (d. 1247), on the pretext that she was wasting the estates by her alms; and with her three infant children she was driven from her home without being allowed to carry with her even the barest necessities of life. She lived for some time in great hardship, but ultimately her maternal uncle, Egbert, bishop of Bamberg, offered her an asylum in a house adjoining his palace. Through the intercession of some of the principal barons, the regency was again offered her, and her son Hermann was declared heir to the landgraviate; but renouncing all power, and making use of her wealth only for charitable purposes, she preferred to live in seclusion at Marburg near the direction of her confessor, the bigoted prelato Conrad of Marburg. There she spent the remainder of her days in penances of unusual severity, and in ministrations to the sick, especially those afflicted with the most loathsome diseases. She died at Marburg on the 19th of November 1231, and four years afterwards was canonized by Gregory IX., on account of the frequent miracles reported to have been performed at her tomb.

The exhibition in the Royal Academy of P. H. Calderon's picture, "St Elizabeth of Hungary's Great Act of Renunciation," now in the Tate Gallery in London, roused considerable protest among Catholics. The saint is represented as kneeling nude before the altar, in the presence of her confessor and a couple of nuns. The passage this is intended to illustrate is in Lib. iv. § 1 of Dietrich of Apolda's Vita, which relates how, on a certain Good Friday, she went into a chapel and, in the presence of some Franciscan brethren, laid her hands on the bare altar, renounced her own will, her parents, children, relations, and all poms of this kind (khusus modi) in imitation of Christ; and stripped herself utterly naked (omnino se exulit et nudavit) in order to follow Him naked, in the steps of poverty. A literal interpretation of this passage is not impossible; for ecstatic mystics of all ages have indulged in a like khusus, and Conrad, who revelled in inflicting religious tortures, was quite capable of imposing this crowning humiliation upon his gentle victim. It is far more probable, however, that the passage is not to be taken literally.

Lives of St Elizabeth were written by Theodoricus (Dietrich) of Apolda (d. 1228), Caesarius of Heisterbach (d. c. 1240), Conrad of Marburg and others (see Potthast, Bibl. Hist. Med. Aen., p. 1284). A metrical life in German exists by Johann Rothe (d. c. 1440), chaplain to the Landgraving of Thuringia (Potthast, p. 985). L'Histoire de Sainte Elisabeth de Hongrie, by Montalembert, was published at Paris in 1876. Her life has also supplied the materials for a dramatic poem by Charles Kingsley, entitled the "Saint's Tragedy." The edition of this in vol. xvi. of the Life and Works of Charles Kingsley (London, 1902) has valuable notes, with many extracts from the original sources.

ELIZABETH, a city and the county-seat of Union county, New Jersey, U.S.A., on Elizabeth river, Newark Bay, and Arthur Kill, 10 m. S.W. of Jersey City. Pop. (1890) 37,764; (1900) 52,130, of whom 14,770 were foreign-born and 11,900 were negroes; (1910 census) 73,409. It is served by the Pennsylvania, the Lehigh Valley and the Central of New Jersey railways. The site is level and the streets are broad and shaded. There are many residences of New York business men, and several historic buildings, including Liberty Hall, the mansion of William Livingston, first governor of the state; Boxwood Hall (now used as a home for aged women), the former home of Elias Boudinot; the old brick mansion of Jonathan Belcher (1681-1757), governor of the province from 1747 to 1757; the First Presbyterian Church; and the house occupied at different times by General Winfield Scott. The city has several parks, the Union county court house (1905), a public library and several charitable institutions. Elizabethport, that part of the city on Staten Island, having about 2 m. S.E. of the centre of Elizabeth, has a port open to vessels of 300 tons; it is an outlet of the Pennsylvania coal fields and is thus one of the most important coal shipping depots in the United States. Here, too, are a plant (covering more than 800 acres) of the Standard Oil Company and a large establishment for the manufacture of the "Singer" sewing machine—according to the U.S. census the largest manufactory of sewing machines in the world—employing more than 6000 workmen in 1903; among the other manufactures of Elizabeth are foundry and machine shop products (value in 1905, $3,887,130), wire, oil (value in 1905, $2,387,650), refined and smelted copper, the output of railway repair shops, edge tools and lager beer. The value of the manufactured products was $10,489,364 in 1890; $28,861,375 (factory product) in 1900; and $29,300,801 (factory product) in 1905.

Elizabeth was settled in 1665 by a company from Long Island for whom the land had been purchased from the Indians and a grant had been obtained from Richard Nicolls as agent for the proprietors of New York. But about the same time the Dutch claimed the entire province to John, Lord Berkeley, and Sir George Carteret, and these two conflicting grants gave rise to a long-continued controversy (see NEW JERSEY). The town was named in honour of Elizabeth, wife of Sir George Carteret, and was first known as Elizabettown. From 1665 to 1686 it was the seat of government of the province, and the legislature sat here occasionally until 1790. In the home of the Rev. Jonathan Dickinson (1688-1747), its first president, the first sessions of the College of New Jersey (now Princeton University) were held in 1747, but immediately afterwards the college removed to Newark. In December 1776 and twice in June 1780 the British entered Elizabeth and made it a base of operations, but on each occasion they were soon driven out. Elizabeth became a "free town and borough" in 1739; the borough charter was confirmed
ELIZABETHAN STYLE—ELLA

ELHART, a city of Elkhart county, Indiana, U.S.A., at the confluence of the Elkhart and St Joseph rivers, about 100 m. E. of Chicago. Pop. (1890) 11,390; (1900) 15,184, of whom 1353 were foreign-born; (1910) 28,282. Elkhart is at the junction of the western division with the main line of the Lake Shore & Michigan Southern railway, and is served by the Cleveland, Cincinnati, Chicago & St Louis, and the Northern Indiana railways (the latter electric). It is attractively situated and has fine business and public buildings, including a Carnegie library and the Clark hospital, with which a nurses' training school is connected. It has also several parks, including the beautiful Island Park and McNaughton Park, the latter the annual meeting-place of the St Joseph Valley Chautauqua. A valuable water-power is utilized for manufacturing purposes. There are extensive railway-carshops and iron and brass foundries, and the manufactures include band instruments, furniture, telephone supplies, established trusses, bridges, paper, flour, starch, rubber goods, acetylene gas machines, printing presses, drugs and carriages. The total value of the factory product was $4,325,466 in 1905, an increase of 10-5% since 1900. At Elkhart is the main publishing house of the Mennonite Church in America, two weekly periodicals being issued, one in English, The Herald of Truth, and one in German, the Mennonitische Rundschau. The first settlement was made here about 1834; and Elkhart was chartered as a city in 1875.

ELKINGTON, GEORGE RICHARDS (1801–1869), founder of the electroplating industry in England, was born in Birmingham on the 17th of October 1801, the son of a spectacle manufacturer. Apprenticed to his uncle, silver platers in Birmingham, he became, on their death, sole proprietor of the business, but subsequently took his cousin, Henry Elkington, into partnership. The science of electrometallurgy was then in its infancy, but the Elkingtons were quick to recognize its possibilities. They had already in mind the application of electricity to metals when, in 1840, John Wright, a Birmingham surgeon, discovered the valuable properties of a solution of cyanide of silver in cyanide of potassium for electroplating purposes. The Elkingtons purchased and patented Wright's process, subsequently acquiring the rights of other processes and improvements. Large new works for electroplating and electrogilding were opened in Birmingham in 1841, and in the following year Josiah Mason became a partner in the firm. George Richards Elkington died on the 22nd of September 1865, and Henry Elkington on the 26th of October 1852.

ELLA, or ELLA, the name of three Anglo-Saxon kings.

ELLA (d. c. 514), king of the South Saxons and founder of the kingdom of Sussex, was a Saxon earloman, who landed near Arundel in Sussex with his three sons in 477. Defeating the Britons, who were driven into the forest of Andresweld, Ella and his followers established themselves along the south coast, although their progress was slow and difficult. However, in 491, strengthened by the arrival of fresh bands of immigrants, they captured the Roman city of Anderida and "killed all that were therein." Ella, who is reckoned as the first Bretwalda, then became king of the South Saxons, and, when he died about 514, he was succeeded by his son Cissa.

ELLA (d. 538), king of the Deirans, was the son of an ealdorman named Ifa, and became the first king of Deira when, in 559, the Deirans separated themselves from the neighbouring kingdom of Bernicia. The English slaves, who aroused the interest of Pope Gregory I. at Rome, were subjects of Ella, and on this occasion the pope, pining the name of their king, suggested that "Alleluia" should be sung in his land. When Ella died in 538 Deira was conquered by Bernicia. One of his sons was Edwin, afterwards king of the Northumbrians.

ELLA (d. 867), king of the Northumbrians, became king about 862. He had seven patents, although he was not of royal birth. Afterwards he became reconciled with Osbert, and together they attacked the Danes, who had invaded Northumbria, and drove them into York. Rallying, however, the Danes defeated the Northumbrians, and in the encounter both Ella and Osbert were slain. In certain legends Ella is represented
as having brought about the Danish invasion of Northumbria by treachery and subterfuges.

The church of St Mary is decorated and perpendicular. Cotton-mills, woollen-factories, ironworks, flagstone quarries at Elland Edge, and fire-clay works employ the industrial population. Elland Hall, though almost rebuilt, retains the recollection of a remarkable family feud between the Ellands and the Beaumonts of Crosland Hall, the site of which may be traced in the vicinity. A nephew of Sir John Elland, in 1342, met death at the hands of a relative of the Beaumonts upon whom Sir John took vengeance as also upon the heads of the allied houses of Lockwood and Quarmby. The children of these families were educated in the hope of averting their parents, and after many years succeeded in doing so, cutting off Sir John Elland and his heir.

ELLENBOROUGH, EDWARD LAW, 1st Baron (1750–1818), English judge, was born on the 16th of November 1750, at Great Salkeld, Cumberland, of which place his father, Edmund Law (1703–1787), afterwards bishop of Carlisle, was at the time rector. Educated at the Charterhouse and at Peterhouse, Cambridge, he passed as third wrangler, and was soon afterwards elected to a fellowship at Trinity. In spite of his father’s strong wish that he should take orders, he chose the legal profession; and on quitting the university was entered at Lincoln’s Inn. After spending five years as a special pleader under the bar, he was called to the bar in 1780. He chose the northern circuit, and in a very short time obtained a lucrative practice and a high reputation. In 1784 he was appointed principal counsel for Warren Hastings in the celebrated impeachment trial before the House of Lords, and the ability with which he conducted the defence was universally recognized. He had begun his political career as a Whig, but, like many others, he saw in the French Revolution a reason for changing sides, and became a supporter of Pitt. On the formation of the Addington ministry in 1801, he was appointed attorney-general and shortly afterwards was returned to the House of Commons as member for Newtown in the Isle of Wight. In 1802 he succeeded Lord Kenyon as chief justice of the king’s bench. On being raised to the bench he was created a peer, taking his title from the village of Ellenborough in Cumberland, where his maternal ancestors had long held a small patrimony. In 1806, on the formation of Lord Grenville’s ministry “of all the talents,” Lord Ellenborough declined the offer of the great seal, but accepted a seat in the cabinet. He was so long so well, and the chief justiceship was much coveted, that, in time, and, though not without precedent, was open to such obvious objections on constitutional grounds that the experiment has not since been repeated. As a judge he had grave faults, though his decisions displayed profound legal knowledge, and in mercantile law especially were reckoned of high authority. He was harsh and overbearing to counsel, and in the political trials which were so frequent in his time showed an unmistakable bias against the accused.

In the trial of William Hone (q.v.) for blasphemy in 1817, Ellenborough directed the jury to find a verdict of guilty, and their acquittal of the prisoner is generally said to have hastened his death. He resigned his judicial office in November 1818, and died on the 13th of December following.

Ellenborough was succeeded as 2nd baron by his eldest son, Edward, afterwards earl of Ellenborough; another son was Charles Ewan Law (1792–1850), recorder of London and member of parliament for Cambridge University from 1835 until his death in August 1836.

Three of Ellenborough’s brothers attained some degree of fame. These were John Law (1745–1810), bishop of Elphin; Thomas Law (1750–1834), who settled in the United States in 1793, and married, as his second wife, Anne, a granddaughter of Martha Washington; and George Henry Law (1761–1845), bishop of Chester and of Bath and Wells. The connexion of the Law family with the English Church was kept up by George Henry’s sons, three of whom took orders. Two of these were Henry Law (1797–1884), dean of Gloucester, and James Thomas Law (1790–1876), chancellor of the diocese of Lichfield.

ELLENBOROUGH, EDWARD LAW, EARL OF (1790–1871), the eldest son of the 1st Lord Ellenborough, was born on the 5th of September 1790. He was educated at Eton and St John’s College, Cambridge. He represented the subsequently disfranchised borough of St Michael’s, Cornwall, in the House of Commons, until the death of his father in 1818 gave him a seat in the House of Lords. He was twice married; his only child died young; his second wife was divorced by act of parliament in 1824.

In the Wellington administration of 1828 Ellenborough was made lord privy seal; he took a considerable share in the business of the foreign office, as an unofficial assistant to Wellington, who was a great admirer of his talents. He aimed at succeeding Lord Dudley at the foreign office, but was forced to content himself with the presidency of the board of control, which he retained until the fall of the ministry in 1830. Ellenborough was an active administrator, and took a lively interest in questions of Indian policy. The revision of the company’s charter was approaching, and he held that the government of India should be transferred directly to the crown. He was impressed with the growing importance of a knowledge of central Asia, in the event of a Russian advance towards the Indian frontier, and despatched Burnes on an exploring mission to that district. Ellenborough subsequently returned to the board of control in Peel’s first and second administrations. He had charge of the post-office department and was appointed governor of Madras in 1833 when he was appointed by the court of directors to succeed Lord Ellenborough as governor-general of India. His Indian administration of two and a half years, or half the usual term of service, was from first to last a subject of hostile criticism. His own letters sent monthly to the queen, and his correspondence with the duke of Wellington, published in 1874, afford material for an intelligent and impartial judgment of his meteoric career. The events chiefly in dispute are his policy towards Afghanistan and the army and captives there, his conquest of Sind, and his campaign in Gwalior.

Ellenborough went to India in order “to restore peace to Asia,” but the whole term of his office was occupied in war. On his arrival there the news that greeted him was that of the massacre of Kabul, and the siege of Ghazni and Jalalabad, while the sepoys of Madras were on the verge of open mutiny. In his proclamation of the 15th of March 1842, as in his memorandum for the queen dated the 18th, he stated with characteristic clearness and eloquence the duty of first inflicting some signal and decisive blow on the Afghans, and then leaving them to govern themselves under the sovereign of their own choice. Unhappily, when he left his council for upper India, and learned the trifling failure of General Gough, he instructed Pollock and Nott, who were advancing triumphantly with their avenging columns to rescue the British captives, to fall back. The army proved true to the governor-general’s earlier proclamation rather than to his later fears; the hostages were rescued, the scene of Sir Alexander Burnes’s murder in the heart of Kabul was burned down. Dost Mahomed was quietly dismissed from a prison in Calcutta to the throne in the Bala Hisar, and Ellenborough presided over the painting of the elephants for an unprecedented military spectacle at Ferozepur, on the south bank of the Sutlej. But this was not the only piece of theatrical display which capped with ridicule the horrors and the follies of these four years in Afghanistan. When Sultan Mahmud in 1824, sacked the Hindu temple of Somnath on the north-west coast of India, he carried off, with the treasures, the richly studded sandal-wood gates of the same, and set them up in north-west England.
capital of Ghazni. The Mahomedan puppet of the English, Shah Shuja, had been asked, when ruler of Afghanistan, to restore to India; and what he had failed to do the Christian ruler of opposing Mahomedans and Hindus resolved to effect in the most solemn and public manner. In vain had Major (afterwards Sir Henry) Rawlinson proved that they were only reproductions of the original gates, to which the Ghazni mountaineers clung merely as a source of offerings from the faithful who visited the old conqueror’s tomb. In vain did the Hindu sepoys show the most chilling indifference to the belauded restoration. Ellenborough could not resist the temptation to copy Napoleon’s magniloquent proclamation under the pyramids. The fraudulent folding doors were conveyed on a triumphal car to the fort of Agra, where they were found to be made not of sandalwood but of deal. That Somnath proclamation (immortalized in a speech by Macaulay) was the first step towards its author’s recall.

Hardly had Ellenborough issued his medal with the legend “Pax Asiae Restituta” when he was at war with the amirs of Sind. The tributary amirs had on the whole been faithful, for Major (afterwards Sir James) Outram controlled them. But he had reported the opposition of a few, and Ellenborough ordered an inquiry. His instructions were admirable, in equity as well as energy, and if Outram had been left to carry them out all would have been well. But the duty was entrusted to Sir Charles Napier, with full political as well as military powers. And to add to the evil, Mir Ali Morad intrigued with both sides so effectually that he betrayed the amirs on the one hand, while he deluded Sir Charles Napier to their destruction on the other. Ellenborough was led on till events were beyond his control, and his own just and merciful instructions were forgotten. Sir Charles Napier made more than one confession like this: "We have no right to seize Sind, yet we shall do so, and a very advantageous, useful and humane piece of rascality it will be.” The battles of Meanees and Hyderabad followed; and the Indus became a British river from Karachi to Multan.

Sind had hardly been disposed of when troubles arose on both sides of the governor-general, who was then at Agra. On the north the disordered kingdom of the Sikhs was threatening the frontier. In Gwalior to the south, the feudal Mahatta state, there were a large mutinous army, a Ranee only twelve years of age, an adopted chief of eight, and factions in the council of ministers. These conditions brought Gwalior to the verge of civil war. Ellenborough reviewed the danger in the minute of the 1st of November 1845, and told Sir Hugh Gough to advance. Further treachery and military licence rendered the battles of Maharajpur and Punnar, fought on the same day, inevitable though they were, a surprise to the combatants. The treaty that followed was as merciful as it was wise. The pacification of Gwalior also had its effect beyond the Sutlej, where anarchy was restrained for yet another year, and the work of civilization was left to Ellenborough’s two successors. But by this time the patience of the directors was exhausted. They had no control over Ellenborough’s policy; his despatches to them were haggard and discouraging; and in June 1844 they exercised the power of recalling him.

On his return to England Ellenborough was created an earl and received the thanks of parliament; but his administration speedily became the theme of hostile debates, though it was successfully vindicated by Peel and Wellington. When Peel’s cabinet was reconstituted in 1846 Ellenborough became first lord of the admiralty. In 1858 he took office under Lord Derby as president of the board of control, for the fourth time. It was then his congenial task to draft the new scheme for the government of India which the mutiny had rendered necessary. But his old fault of impetuosity again proved his stumbling-block. He wrote a caustic despatch censuring Lord Canning for the Oudh proclamation, and allowed it to be published in The Times without consulting his colleagues, who disavowed his action in this respect. General disapprobation was excited; votes of censure were announced in both Houses; and, to save the cabinet, Ellenborough resigned.

But for this act of rashness he might have enjoyed the task of carrying into effect the home constitution for the government of India which he sketched in his evidence before the select committee of the House of Commons on Indian territories on the 8th of June 1852. Paying off his old score against the East India Company, he then advocated the abolition of the court of directors as a governing body, the opening of the civil service to the army, the transference of the government to the crown, and the appointment of a council to advise the minister who should take the place of the president of the board of control. These suggestions of 1852 were carried out by his successor Lord Stanley, afterwards earl of Derby, in 1858, so closely even in details, that Lord Ellenborough must be pronounced the author, for good or evil, of the present home constitution of the government of India. Though acknowledged to be one of the foremost orators in the House of Lords, and taking a frequent part in debate, Ellenborough never held office again. He died at his seat, Southam House, near Cheltenham, on the 22nd of December 1871, when the barony reverted to his nephew Charles Edmund Law (1820-1890), the earldom becoming extinct.

See History of the Indian Administration (Bentley, 1874), edited by Lord Colchester; Minutes of Evidence taken before the Select Committee on Indian Territories (June 1852); volume i. of the Calcula Review; the Friend of India, during the years 1842-1845; and also wheel, 2nd Annual, 125. The Memoir of Sir Charles Napier, on the conquest of Sind, should be consulted.

ELLERY, WILLIAM (1727-1820), American politician, a signer of the Declaration of Independence, was born in Newport, Rhode Island, on the 22nd of December 1727. He graduated from Harvard in 1747, engaged in trade, studied law, and was admitted to the bar in 1770. He was a member of the Rhode Island committee of safety in 1775-1776, and was a delegate in Congress in 1776-1781 and again in 1783-1785. Just after his first election to Congress, he was placed on the important marine committee, and he was made a member of the board of admiralty when it was established in 1779. In April 1786 he was elected commissioner of the continental loan office for the state of Rhode Island and from 1790 until his death at Newport, April 17, 1820, he was a director of the bank, and on the 15th of February 1820, he was collector of the customs for the district of Newport.

ELLESMERE, FRANCIS EGERTON, 1st Earl of (1800-1857), born in London on the 1st of January 1800, was the second son of the 1st duke of Sutherland. He was known by his patronymic as Lord Francis Leveson Gower until 1833, when he assumed the surname of Egerton alone, having succeeded on the death of his father to the estates which the latter inherited from the duke of Bridgewater. Educated at Eton and at Christ Church, Oxford, he entered parliament soon after attaining his majority as member for the pocket borough of Bletchingly in Surrey. He afterwards sat for Sutherlandshire and for South Lancashire, which he represented when he was elevated to the peerage as earl of Ellersmere and Viscount Brackley in 1846. In politics he was a liberal, with a number of independent views, as was shown by his supporting the prize-hunting bill, the university of London, by his making and carrying a motion for the endowment of the Roman Catholic clergy in Ireland, and by his advocating free trade long before Sir Robert Peel yielded on the question. Appointed a lord of the treasury in 1827, he held the post of chief secretary for Ireland from 1828 till July 1836, when he became secretary-at-war for a short time. His claims to remembrance are founded chiefly on his services to literature and the fine arts. Before he was twenty he printed for private circulation a volume of poems, which he followed up after a short interval by the publication of a translation of Goethe’s Faust, one of the earliest that appeared in England, with some translations of German lyrics and a few original poems. In 1830 he visited the Mediterranean and the Holy Land. His impressions of travel were recorded in his very agreeably written Mediterranean Sketches (1843), and in the notes to a poem entitled The Pilgrimage. He published several other works in prose and verse, all displaying a fine literary taste. His literary reputation
ELLESMERE—ELLIOTT, EBENEZER

secured for him the position of rector of Aberdeen University in 1841. Lord Ellesmere was a munificent and yet discriminating patron of artists. To the splendid collection of pictures which he inherited from his great-uncle, the 3rd duke of Bridgewater, he made numerous additions, and he built a noble gallery to which the public were allowed free access. Lord Ellesmere served as president of the Royal Geographical Society and as president of the Royal Asiatic Society, and he was a trustee of the National Gallery. He died on the 18th of February 1857. He was succeeded by his son (1832–1862) as 2nd earl, and his grandson (b. 1847) as 3rd earl.

ELLESMERE, a market town in the Oswestry parliamentary division of Shropshire, England, on the main line of the Cambrian railway, 182 m. N.W. from London. Pop. of urban district (1901) 1945. It is prettily situated on the west shore of the mere or small lake from which it takes its name, while in the neighbourhood are other sheets of water, as Blake Mere, Cole Mere, White Mere, Newton Mere and Crose Mere. The church of St Mary is of various styles from Norman onward, but was partly rebuilt in 1848. The site of the castle is occupied by pleasure gardens, commanding an extensive view from high ground. The town hall contains a library and a natural history collection. The college is a large boys' school. The town is an important agricultural centre. Ellesmere canal, a famous work of Thomas Telford, connects the Severn with the Mere, and is channeled by an immense aqueduct, 336 yds. long and 127 ft. high.

The manor of Ellesmere (Ellesmele) belonged before the Conquest to Earl Edwin of Mercia, and was granted by William the Conqueror to Roger, earl of Shrewsbury, whose son, Robert de Belesme, forfeited it in 1112 for treason against Henry I. In 1177 Henry II. gave it with his sister in marriage to David, son of Owen, prince of North Wales, after whose death it was retained by King John, who in 1206 granted it to his daughter Joan on her marriage with Llewellyn, prince of North Wales; it was finally surrendered to Henry III. by David, son of Llewellyn, about 1240. Ellesmere owed its early importance to its position on the Welsh borders and to its castle, which was in ruins, however, in 1349. While Ellesmere was in the hands of Joan, lady of Wales, she granted to the borough all the free customs of Brethuil. The town was governed by a bailiff appointed by a jury at one of the court leets of the lord of the manor, until a local board was formed in 1859. In 1221 Henry III. granted Llewellyn, prince of Wales, a market on Thursdays in Ellesmere. The inquisition taken in 1358 after the death of Roger le Strange (Lord Strange), lord of Ellesmere, shows that he also held two fairs there on the feast of St Mary and the Nativities of the Virgin and St John. By the 16th century the market had been discontinued or absorbed by the plague by which many of the inhabitants had died, and the queen granted that Sir Edward Kynaston, Kt., and thirteen others might hold a market every Thursday and a fair on the 3rd of November. Since 1792 both have been discontinued.

The commerce of Ellesmere has always been chiefly agricultural.

ELLICE (LAGOON) ISLANDS, an archipelago of the Pacific Ocean, lying between 5° and 11° S. and about 178° E., nearly midway between Fiji and Gilbert. It is under British protection, being annexed in 1892. It comprises a large number of low coraline islands and atolls, which are disposed in nine clusters extending over a distance of about 400 m. in the direction from N.W. to S.E. Their total area is 14 sq. m. and the population is about 2400. The chief groups, all yielding coco-nuts, pandanus fruit and yams, are Funafuti or Ellice, Nukulaelai or Mitchell, Nukakita or Sophia, Nukufetau or De Peyster, Nui or Ega, Nanomania or Hudson, and Niutao or Lynx. Nearly all the natives are Christians, Protestant missions having been long established in several of the islands. Those of Nui speak the language of the Gilbert islanders, and have a tradition that they came originally from that group. All the others speak a form of Samoan speech, and their tradition that they came thirty generations back from Samoa is supported by recent research. They have an ancient spear which they believe was brought from Samo, and they actually name the valley from which their ancestors started. A missionary visiting the Samoan valley

found there a tradition of a party who put to sea never to return, and he also found the wood of which the staff was made growing plentifully in the district. Borings and soundings taken at Funafuti in 1857 indicate almost beyond doubt that the whole of this Polynesian region is an area of comparatively recent subsidence.

ELLICHPUR, or ILlichpur, a town of India in the Amroati district of Berar. Pop. (1901) 26,682. It is first mentioned authentically in the 13th century as "one of the famous cities of the Deccan." Though tributary to the Mahomedans after 1204, it remained under Hindu administration till 1328, when it came directly under the Mahomedans. It was afterwards capital of the province of Berar at intervals until the Mogul occupation, when the seat of the provincial governor was moved to Balapur. The town retains many relics of the nawabs of Berar. It has ginning factories and a considerable trade in cotton and forest produce. It is connected by good roads with Amraoti and Chikaldar. It was formerly the headquarters of the district of Ellichpur, which had an area of 2605 sq. m. and a population in 1901 of 297,403. This district, however, was merged in that of Amraoti in 1905. The civil station of Paratwada, 2 m. to the NE., is the market and principal public buildings.

ELLIOTSON, JOHN (1791–1868), English physician, was born at Southwark, London, on the 29th of October 1791. He studied medicine first at Edinburgh and then at Cambridge, in both which places he took the degree of M.D., and subsequently in London at St Thomas's and Guy's hospitals. In 1831 he was elected professor of the principles and practice of physic in London University, and in 1834 he became physician to University College hospital. He was a student of phrenology and mesmerism, and his interest in the latter eventually brought him into collision with the medical committee of the hospital, a circumstance which led him, in December 1838, to resign the offices held by him there and at the university. But he continued the practice of mesmerism, holding séances in his home and editing a magazine, The Zoist, devoted to the subject, and in 1849 he founded a mesmeric hospital. He died in London on the 29th of July 1868.

Elliottson was one of the first teachers in London to appreciate the value of clinical lecturing, and one of the earliest among British physicians to advocate the employment of the stethoscope. He wrote a translation of Blumenbach's Institutiones Physiologicus Physiologicus (1817); Cases of the Hydrogenous or Prussic Acid Inhalation of (1830); Principles and Practice of Medicine (1830); and Surgical Operations in the Mesmeric State without Pain (1834). He was the author of numerous papers in the Transactions of the Medico-Chirurgical Society, of which he was at one time president; and he was also a fellow both of the Royal College of Physicians and Royal Society, and founder and president of the Phrenological Society. W. M. Thackeray's Pendennis was dedicated to him.

ELLIOTT, EBENEZER (1781–1849), English poet, the "corn-

law rhymer," was born at Masborough, near Rotherham, Vox-

shire, on the 17th of March 1781. His father, who was an

extreme Calvinist and a strong radical, was engaged in the iron

trade. Young Ebenezer, although one of a large family, had a

solitary and rather morbid childhood. He was sent to various

schools, but was generally regarded as a dunce, and when he

was sixteen years of age entered his father's foundry, working

for seven years with no wages beyond a little pocket money.

In a fragment of autobiography printed in the Athenaeum

(12th of January 1830) he says that he was entirely self-taught,

and attributes his poetic development to long country walks

and evenings spent in search of wild flowers, and to a collection

of books, including the works of Young, Barrow, Shenstone and Milton

bequeathed to his father by a poor clergyman. At seventeen

he wrote his Vernal Walk in imitation of Thomson. His earlier

volumes of poems, dealing with romantic themes, received little

but unfriendly comment. The faults of Night, the earliest of

ELLIPSE

To investigate the form of the curve we have made the definition: the ellipse is the locus of a point which moves so that the ratio of its distance from a fixed point (the focus) to its distance from a straight line (the directrix) is constant and less than unity. This point is termed the eccentricity, and will be denoted by e. Let KX (fig. 1) be the directrix, S the focus, and X the foot of the perpendicular from S to KX. If SX be divided at A so that \(SA/AX = e\), then A will be on the curve. SX may be also divided externally at A', so that SA'/AX'=e, since e is less than unity. A and A' are the vertices, and the line AA' the major axis of the curve. It is obvious that the curve is symmetrical about AA'. If AA' be bisected at C, and the line BC'B' be drawn perpendicular to AA', of conjugate diameters that the curve is symmetrical about this line also; since if we take S' on AA' so that S'A/SA = e, and a line K'X' parallel to KX such that AX' = AX, then the same curve will be described if we regard K'X' and S' as the given directrix and focus, the eccentricity being the same. The projecting points on the curve, BB' is the minor axis and C the centre of the curve.

Mathematical relations between the axes, eccentricity, distance between the foci, and between these quantities and the co-ordinates of points on the curve, are readily obtained by the methods of geometrical conics or analytically.

The semi-major axis is generally denoted by a, and the semi-minor axis by b, and we have the relation \(b^2 = a^2(1-e^2)\). Also \(c^2 = a^2 - b^2\), where c is the semi-latus rectum, and \(2c = SP + SP'\), where S is any point on the curve, i.e. the sum of the focal distances of any point on the curve equals the major axis. The two important tangents from the co-ordinates of a point on an ellipse is: if N be the foot of the perpendicular from a point P, then the square on PN bears a constant ratio to the product of the segments AN, NA' of the major axis, this ratio being the square of the eccentricity, i.e. \(AN \cdot NA' = (b^2/a^2) \cdot PN^2\).

The circle or auxiliary circle of a conic is the circle which has at the point of a circle having the same centre as the ellipse; this is the director circle.

The middle points of a system of parallel chords is a straight line, and the corresponding point on this line meets the line parallel to the chords. The straight line and the line through the centre parallel to the chords are named conjugate diameters; each bisects the conjugate parallel to the other. An important geometrical relation is that the sum of the squares equals the sum of the squares of the major and minor axis.

In analytical geometry, the equation \(ax^2 + 2hxy + by^2 + 2gx + 2fy + \), represents an ellipse when \(a^2 + b^2 > 0\); if the centre of the curve is the origin, the equation is \(x^2 + 2hxy + y^2 = 0\), and if in addition a pair of conjugate diameters are the axes, the equation is further simplified to \(x^2 + b^2 = C\). The simplest form is \(x^2/a^2 + y^2/b^2 = 1\), in which case the centre is the origin and the major and minor axes the coordinates of the foci; in this case it is readily shown that the minor axis, or the distance between the foci on an ellipse may be expressed in terms of a single parameter, the abscissa being \(a \cos \phi\), and the ordinate \(b \sin \phi\), since on eliminating \(\phi\) between \(x = a \cos \phi\) and \(y = b \sin \phi\) we obtain the equation to the angle \(\phi\) as \(a^2 \cos^2 \phi + b^2 \sin^2 \phi = c^2\). Again the right angle \(\phi\) is the angle represented as the angle between the axes \(x\) (the major axis of the ellipse) and the radius of a point on the auxiliary circle which has the same abscissa as the point on the ellipse.

The equation to the ellipse or its axis is \(x \cos \theta + y \sin \theta = \), and to the normal \(\cos \theta - \sin \theta = \), to the general area is \(ax + by = \), and to the area \(ax \phi + by = \). The area of the ellipse is \(\pi ab\), where \(a\), \(b\) are the semi-axes; this result may be deduced by regarding the ellipse as the orthogonal projection of a segment of revolution of a circle on a plane inclined at an angle to that of the plane of the circle. The pi may be also expressed as a series, the analytical evaluation leading to an integral termed elliptic (see FUNCTION, ii. Complex).

There are several approximation formulae: \(-S = \pi(a + b)\) makes the perimeter about 1/900 too small; \(s = \pi(a^2 + b^2)/2\) about too great; \(25 = \pi(a + b + s)(a^2 + b^2)\) about 1/15,000 of the truth.

An ellipse can generally be described to satisfy any five conditions. If five points be given, Pascal's theorem affords a solution; if five tangents, Brianchon's theorem is employed.
involution solves such constructions as: given four tangents and one point, three tangents and two points, &c. If a tangent and its point of contact be given, it is only necessary to remember that a double point on the curve is given. A focus or directrix is equal to two conditions: hence such problems as a focus and an axis are equivalent to a focus, two points and one tangent; and a focus, one point, and two tangents are solvable (very conveniently by employing the principle of reciprocation). Of practical importance are the following constructions: (1) Given the axis, x given, and the point, p; and the focus, the eccentricity and directrix: (2) to construct an ellipse (approximately) by means of circular arcs. (1) If the axes be given, we may obtain ourselves of several constructions. (a) Let AA', BB' be the axes intersecting at right angles in a point C. Take a strip of paper or rubber and mark two points P and Q on the strip, distances PA and PB equal respectively to CA and CB. Then if the strip be moved along the major axis, the point P describes the ellipse. This is known as the centered construction. (b) Let AA', BB' be the axes as before; describe on each as diameter a circle. Draw any number of radii of the two circles, and from the points of intersection with the major circle draw lines parallel to the minor axis, and from the points of intersection with the minor circle draw lines parallel to the major axis. The intersections of the lines drawn from corresponding points are points on the ellipse. (2) If the major axis and foci be given, there is a convenient mechanical construction based on the property that the sum of the focal distances of any point is constant and equal to the major axis. Let AA' be the axis and S, S' the foci. Take a piece of thread of length AA', and fix it at its extremities by means of pins at the foci. The thread is then wound upon a taut cord, and the pencil moved; the curve traced out is the desired ellipse. (3) If the directrix, foci and eccentricity be given, we may employ the general method for constructing a conic. Let S (fig. 2) be the focus, and S' the minor axis at right angles to S from the directrix. Divide SX internally at A and externally at A', so that the ratios SA/AE and SA'/AE' are equal to the eccentricity. Then A, A' are the vertices of the curve. Take any point R on the directrix, and draw the lines RAM, RSN; draw SL so that the angle LSN = angle S'RN, and let P be the point in which the lines SL with the line RAM, then it can be readily shown that P is a point on the ellipse. For, draw through P a line parallel to AA', intersecting the lines SQ and the line RSN in T. Then since SQ and ST are parallel and TS is intersected by the lines RK, \( \frac{B}{M} \), RN, we have \( \frac{SA}{AX} = \frac{TP}{FP} = \frac{SP}{PF} \), since that \( \frac{FS}{ST} = \frac{AA'}{MM} \). By varying the position of R other points can be found, and, since the curve is symmetrical about both the major and minor axes, it is obvious that any point may be reflected in both axes, and the two corresponding points are given. (4) If the axes be given, the curve can be approximately constructed by circular arcs in the following manner: Let AA', BB' be the axes; determine D the intersection of lines through B and A parallel to the major and minor axes respectively, draw AD and AB, and join EB. Then the intersection of DB and DB' determines a point P on the (true) curve. Bisect the chord PB at G, and draw through G a line perpendicular to PB, intersecting BB' in O. An arc with centre O and radius OQ forms the circumference of the circle. Let the parallel reverse side to PB intersect a line through O parallel to the major axis in a point H. Then HA' will cut the circular arc in J. Let JO intersect the major axis in O. Then with centre O and radius OJ, and draw an arc. By the circle the centre of the ellipse is approximately described.

ELLIPSOID, a quadric surface whose sections are ellipses. Analytically, it has for its equation \( x^2/a^2 + y^2/b^2 + z^2/c^2 = 1 \), a, b, c being its axes; the name is also given to the solid contained by this surface (see Geography: Analytical). The solids and surfaces of revolution of the ellipse are sometimes termed ellipsoids, but it is advisable to use the name spheroid (q.v.).

The ellipsoid appears in the mathematical investigation of physical properties of media in which the particular property varies in three directions within the media; such properties are the elasticity, giving rise to the strain ellipsoid, thermal expansion, ellipsoid of expansion, thermal conduction, refractive index (see Crystallography), &c. In mechanics, the ellipsoid of gyration or inertia is such that the perpendicular from the centre to a tangent plane is equal to the radius of gyration of the given body about the perpendicular axis; the "momental ellipsoid," also termed the "inverse ellipsoid of inertia," or Poinsot's ellipsoid, has the perpendicular inversely proportional to the radius of gyration; the "equipollent ellipsoid" is such that its moments of inertia about all axes are the same as those of a given body. (See Mechanics.)

ELLIPHTICITY, in astronomy, deviation from a circular or spherical form; applied to the elliptic orbits of heavenly bodies, or the spheroidal form of such bodies. (See also Compression.)

ELLIS (originally Sharpe), Alexander John (1814-1890), English philologist, mathematician, musician and writer on phonetics, was born at Hoxton on the 14th of June 1814. He was educated at Shrewsbury, Eton, and Trinity College, Cambridge, and took his degree in high mathematical honours. He was connected with many learned societies as member or president, and was governor of University College, London. He was the first in England to reduce the study of phonetics to a science. His most important work, to which the greater part of his life was devoted, is On Early English Pronunciation, with special reference to Shakespeare and Chaucer (1869-1869), in five parts, which he intended to supplement by a sixth, containing an abstract of the whole, an account of the views and criticisms of other inquirers in the same field, and a complete index, but ill-health prevented him from carrying out his intention. He had long been associated with Isaac Pitman in his attempts to reform English spelling, and published A Plea for Phonoty and Phonography (1845) and A Plea for Phonetic Spelling (1848); and contributed the articles on "Phonetics" and "Speech-sounds" to the 9th edition of the Encyc. Brit. He translated (with considerable additions) Helmholz's Sensations of Tone as a physio-Biological Basis for the Theory of Music (2nd ed., 1883); and was the author of several smaller works on music, chiefly in connexion with his favourite subject phonetics. He died in London on the 28th of October 1890.

Ellis, George (1753-1815), English author, was born in London in 1753. Educated at Westminster school and at Trinity College, Cambridge, he began his literary career by some satirical verses on Bath society published in 1777, and Poetical Tales, by "Sir Gregory Gander," in 1778. He contributed to the Rolla and the Probationary Odes political satires directed against Pitt's administration. He was employed in diplomatic business at the Hague in 1784; and in 1797 he accompanied Lord Malmesbury to Lille as secretary to the embassy. On his return he was introduced to Pitt, and the episode of the Rolliland, which had not been forgotten, was explained. He found continued scope for his powers as a political caricaturist in the columns of the Anti-Jacobin, a weekly paper which he founded in connexion with George Canning and William Gifford. For some years before the Anti-Jacobin was started Ellis had been working in the congenial field of Early English literature, in which he was one of the first to arouse interest. The first edition of his Specimens of the Early English Poets appeared in 1790; and this was followed by Specimens of Early English Metrical Romances (1805). He also edited Gregory Lewis Way's translation of select Rablains in 1796. Ellis was an intimate friend of Sir Walter Scott, who styled him "the first converser I ever saw," and dedicated to him his Records of Early English Literature. The correspondence between them is to be found in Lockhart's Life. He died on the 10th of April 1815. The monument erected to his memory in the parish church of Gunning Hill, Berks, bears a fine inscription by Canning.

Ellis, Sir Henry (1777-1869), English antiquary, was born in London on the 20th of November 1777. He was educated at Merchant Taylers' school, and at St John's College, Oxford, of which he was elected a fellow. After having held for a few months a sub-librarianship in the Bodleian, he was in 1808 appointed to a similar post in the British Museum. In 1827 he became chief librarian, and held that post until 1856, when he resigned on account of advancing age. In 1832 William IV. made him a knight of Hanover, and in the following year he received an English Honour. He died on the 11th of January 1869. Sir Henry Ellis's life was one of very considerable literary activity. His first work of importance was the preparation of a new edition of Brand's Popular Antiquities, which appeared in 1813. In 1816 he was selected by the commissioners of public
ELLIS, ROBINSON—ELENSWORTH

records to write the introduction to Domesday Book, a task which he discharged with much learning, though several of his views have not stood the test of later criticism. His Original Letters Illustrative of English History (first series, 1834; second series, 1837; third series, 1846) are compiled chiefly from manuscripts in the British Museum and the State Paper Office, and have been of considerable service to historical writers. To the Library of Entertaining Knowledge he contributed four volumes on the Elgin and Townley Marbles. Sir Henry was for many years a director and joint-secretary of the Society of Antiquaries.

ELLIS, ROBINSON (1834– ), English classical scholar, was born at Barming, near Maidstone, on the 5th of September 1834. He was educated at Elizabeth College, Guernsey, Rugby, and Balliol College, Oxford. In 1858 he became fellow of Trinity College, Oxford, and in 1870 professor of Latin at University College, London. In 1876 he returned to Oxford, where from 1883 to 1893 he held the university readership in Latin. In 1893 he succeeded Henry Netterville as professor. His chief work has been on Catullus, whom he began to study in 1859. His first Commentary on Catullus (1876) aroused great interest, and called forth a flood of criticism. In 1889 appeared a second and enlarged edition, in which he revised and amplified his first work. In the same year appeared his two-volume work on authorities on Catullus. Professor Ellis quotes largely from the early Italian commentators, maintaining that the land where the Renaissance originated had done more for scholarship than is commonly recognized. He has supplemented his critical work by a translation (1875, dedicated to Tennyson) of the poems in the metres of the originals. Another author to whom Professor Ellis has devoted many years' study is Manilius, the astrological poet. In 1891 he published Noces Maniliianae, a series of dissertations on the Astronomica, with emendations. He has also treated Avianus, Velleius Paterculus and the Christian poet Orientius, whom he edited for the Vienna Corpus Scriptorum Ecclesiasticorum. He edited the Ibis of Ovid, the Aetha of the younger Lucilius, and contributed to the Anelecta Oxoniensia various unedited Bodleian and other manuscripts. In 1907 he published Appendix Vergiliana (an edition of the minor poems); in 1908 The Annalists Latinius.

ELLIS, WILLIAM (1794–1872), English Nonconformist missionary, was born in London on the 29th of August 1794. His early years were spent in Westminster, and he was apprenticed as a market-gardener. In 1814 he offered himself to the London Missionary Society, and was accepted. During a year's training he acquired some knowledge of theology and of various practical arts, such as printing and bookbinding. He sailed for the South Sea Islands in January 1816, and remained in Polynesia, occupying various stations in succession, until 1824, when he was compelled to return home on account of the state of his wife's health. Though the period of his residence in the islands was thus comparatively short, his labours were very fruitful, contributing perhaps as much as those of any other missionary to bring about the extraordinary improvement in the religious, moral and social condition of the Pacific Archipelago that took place during the 19th century. Besides promoting the spiritual object of his mission, he introduced many other aids to the improvement of the condition of the people. His gardening experience enabled him successfully to acclimatize many species of tropical fruits and plants, and he set up and worked the first printing press in the South Seas. Returning home by way of the United States, where he advocated his work, Ellis was for some years employed as a travelling agent of the London Missionary Society, and in 1832 was appointed foreign secretary to the society, an office which he held for seven years. In 1837 he married his second wife, Sarah Stickney, a writer and teacher of some note in her generation. In 1841 he went to live at Hอดdesdon, Herts, and ministered to a small Congregational church there. On behalf of the London Missionary Society he paid three visits to Madagascar (1833–1837), inquiring into the prospects for resuming the work that had been suspended by Queen Ranavolona's hostility. A further visit was paid in 1863. Ellis wrote accounts of all his travels, and Southey's praise (in the Quarterly Review) of his Polynesian Researches (2 vols., 1829) finds many echoes. He was a fearless, upright and tactful man, and a keen observer of nature. He died on the 25th of June 1872.

ELLISTON, ROBERT WILLIAM (1774–1831), English actor, was born in London on the 7th of April 1774, the son of a watchmaker. He was educated at St Paul's school, but ran away from home and made his first appearance on the stage as Tressel in Richard III. at Bath in 1791. Here he was later seen as Romeo, and in other leading parts, both comic and tragic, and he repeated his successes in London from 1796. He acted at Drury Lane from 1804 to 1809, and again from 1812; and from 1819 he was the lessee of the house, presenting Keen, Mme Vestris and Macready. Ill-health and misfortune culminated in his bankruptcy in 1826, when he made his last appearance at Drury Lane as Falstaff. But as lessee of the Surrey theatre he acted almost up to his death, which was hastened by intemperance. Leigh Hunt compared him favourably with Garrick; Byron thought him inimitable in high comedy; Macready praised his versatility. Elliston was the author of The Venetian Outlaw (1803), and, with Francis Godolphin Waldron, of No Prelude (1803), in both of which plays he appeared.

ELLORA, a village of India in the native state of Hyderabad, near the city of Daulatabad, famous for its rock temples, which are among the finest in India. The first mention of Ellora is by Ma'sudi, the Arabic geographer of the 10th century, but merely as a celebrated place of pilgrimage. The caves differ from those of Ajanta in consequence of their being excavated in the sloping sides of a hill and not in a nearly perpendicular cliff. They extend along the face of the hill for a mile and a quarter, and are divided into three distinct series, the Buddhist, the Brahmanical and the Jain, and are arranged almost chronologically. The most splendid of the whole series is the Kailas, a perfect Dravidian temple, complete in all its parts, characterized by Ferguson as one of the most wonderful and interesting monuments of architectural art in India. It is not a mere interior chamber cut in the rock, but is a model of a complete temple such as might have been erected on the plain. In other words, the rock has been cut away externally as well as internally. First the great sunken court measuring 276 ft. by 154 ft. was hewn out of the solid, trap-rock of the hillside, leaving the rock mass of the temple wholly detached in a cloistered court like a colossal boulder, whose base rested on a regular square pedestal. From this rock bridge once connected the upper story of the temple with the upper storey of the great chambers surrounding three sides of the court. Colossal elephants and obelisks stand on either side of the open mandapam, or pavilion, containing the sacred bull; and beyond rises the monolithic Dravidian temple to Siva, 90 ft. in height, hollowed out of a single giant rock, and seen internally in a similar manner as that from which it was hollowed out of the mountain. There are two great models of the temple on an extended scale. By means of a thorough study of the monolithic buildings, and by means of the temple at Ellora, the student can get a clearer idea of the character of the temple than by which has been attempted on the plain. The temple was built by Krishna I., Rashtrakuta, king of Malakad in 760–783.

ELLORE, a town of British India, in the Kistna district of Madras, on the East Coast railway, 303 m. from Madras. Pop. (1901) 33,521. The two canal systems of the Godavari and the Kistna deltas meet here. There are manufactures of cotton and saltpetre, and an important Church of England high school. Ellore was formerly a military station, and the capital of the Northern Circars. At Pedda Vegi to the north of it are extensive ruins, which are believed to be remains of the Buddhist kingdom of Vengi. From these the Mahommedans, after their conquest of the district in 1470, obtained a foothold for building fort of Ellapore.

ELLSWORTH, OLIVER (1745–1807), American statesman and jurist, was born at Windsor, Connecticut, on the 29th of April 1745. He studied at Yale and Princeton, graduating from the latter in 1766, studied theology for a year, then law, and began to practise at Hartford in 1771. He was state's attorney for Hartford county from 1777 to 1783, and achieved extraordinary success at the bar, amassing what was for his day a large fortune. From 1773 to 1775 he represented the town of Windsor in the general assembly of Connecticut, and in the latter year became a member of the important commission known as the "Pay Table," which supervised the colony's expenditures
for military purposes during the War of Independence. In 1779 he again sat in the assembly, this time representing Hartford. From 1777 to 1783 he was a member of the Continental Congress, and in this body he served on three important committees, the marine committee, the board of treasury, and the committee of appeals, the predecessors respectively of the navy and treasury departments and the Supreme Court under the Federal Constitution. From 1780 to 1785 he was a member of the governor's council of Connecticut, which, with the lower house before 1784 and alone from 1784 to 1807, constituted a supreme court of errors; and from 1785 to 1789 he was a judge of the state superior court. In 1787, with Roger Sherman and William Samuel Johnson (1727–1819), he was one of Connecticut's delegates to the constitutional convention at Philadelphia, in which his services were numerous and important. In particular, when disagreement seemed inevitable on the question of representation, he, with Roger Sherman, proposed what is known as the "Connecticut Compromise," by which the Federal legislature was made to consist of two houses, the upper having equal representation from each state, the lower being chosen on the basis of population. Ellsworth also made a determined stand against paper money, but having completed his work on the convention before its adjournment, he did not sign the instrument, but used his influence to secure its ratification by his native state. From 1789 to 1796 he was one of the first senators from Connecticut under the new Constitution. In the senate he was looked upon as President Washington's personal spokesman and as the leader of the Administration party. His most important service to his country was without a doubt in connexion with the establishment of the Federal judiciary. As chairman of the committee having the matter in charge, he drafted the bill by the enactment of which the system of Federal courts, almost as it is to-day, was established. He also took a leading part in the senate in securing the passage of laws for funding the national debt, assuming the state debts and establishing a United States bank. It was Ellsworth who suggested to Washington the sending of John Jay to England to negotiate a new treaty with Great Britain, and he probably did more than any other man to induce the senate, despite widespread and violent opposition, to ratify that treaty when negotiated. Washington himself, when Ellsworth was appointed chief justice of the Supreme Court of the United States in March 1796, and in 1790 President John Adams sent him, with William Vans Murray (1762–1803) and William R. Davie (1756–1832), to negotiate a new treaty with France. It was largely through the influence of Ellsworth, who took the principal part in the negotiations, that Napoleon consented to a convention, of the 30th of September 1800, which secured for citizens of the United States their ships captured by France but not yet condemned as prizes, provided for freedom of commerce between the two nations, stipulated that "free ships shall give a freedom to goods," and contained provisions favourable to neutral commerce. While he was abroad, failing health compelled him (1800) to resign the chief-justicehip, and after some months in England he returned to America in 1801. In 1803 he was again elected to the governor's council, and in 1807, on the reorganization of the Connecticut judiciary, was appointed chief justice of the new Supreme Court. He never took office, however, but died at his home in Windsor on the 27th of November 1807.

See W. C. Brown's Oliver Ellsworth (New York, 1899), an excellent biography. There is also an appreciative account of Ellsworth's life and work in H. C. Lodge's A Fighting Frigate, and Other Essays and Addresses (New York, 1902), which contains in an appendix an interesting letter by Senator George F. Hoar concerning Ellsworth's work in the constitutional convention.

ELLSWORTH, a city, port of entry and the county seat of Hancock county, Maine, U.S.A., at the head of navigation on the Union river (and about 34 m. from its mouth), about 30 m. S.E. of Bangor. Pop. (1800) 4804; (1900) 4207 (180 foreign-born); (1910) 3549. It is served by the Maine Central railway. The fall of the river, about 85 ft. in 2 m., furnishes good water-power, and the city has various manufactures, including lumber, shoes, woolens, sails, carriages and foundry and machine shop products, besides a large lumber trade. Shipbuilding was formerly important. There is a large United States fish hatchery here. The city is the port of entry for the Frenchman's Bay customs district, but its trade is unimportant. Ellsworth was first settled in 1763 and for some time was called New Bowdoin; but when it was incorporated as a town in 1800 the present name was adopted in honour of Oliver Ellsworth. A city charter was secured in 1860.

ELLLANGEN, a town of Germany in the kingdom of Württemberg, on the Jagst, 12 m. S.S.E. from Crailsheim on the railway to Goldhöhe. Pop. 5000. It is romantically situated between two hills, one crowned by the castle of Hohen-Ellwangen, built in 1354 and now used as an agricultural college, and the other, the Schönenberg, by the pilgrimage church of Our Lady of Loreto, in the Jesuit style of architecture. The town possesses one Evangelical and five Roman Catholic churches, among the latter the Stiftskirche, the old abbey church, a Romanesque building dating from 1124, and the Gothic St Wolfgangskirche. The classical and modern schools (Gymnasium and Realschule) occupy the buildings of a suppressed Jesuit college. The industries include the making of parchment covers, of envelopes, of wooden hafts and handles for tools, &c., and tanneries. There are also a wool-market and a horse-market, the latter famous in Germany.

The Benedictine abbey of Ellwangen is said to have been founded in 764 by Herulf, bishop of Langres; there is, however, no record of it before 814. In 1460 the abbey was converted, with the consent of Pope Pius II, into a Ritterstift (college or institution for noble pensioners) under a secular provost, who, in 1555, was raised to the dignity of a prince of the Empire. The provostship was secularized in 1803 and its territories were assigned to Württemberg. The town of Ellwangen, which grew up round the abbey and received the status of a town about the middle of the 14th century, was until 1803 the capital of the provostship.

See Seckler, Beschreibung der gefürsteten Probstei Ellwangen (Stuttgart, 1864); Beschreibung des Oberamts Ellwangen, published by the statistical bureau (Landesamt) at Ellwangen (1888). For a list of the abbots and provosts see Stokvis, Manuel d'histoire (Leiden, 1890–1893), iii. p. 242.

ELLWOOD, THOMAS (1659–1714), English author, was born at Crowell, in Oxfordshire, in 1659. He is chiefly celebrated for his connexion with Milton, and the principal facts of his life are related in a very interesting autobiography, which contains many remarkable and charming intercousal history of Milton. While he was still young his father removed him to London, where he became acquainted with a Quaker family named Pennington, and was led to join the Society of Friends, a connexion which subjected him to much persecution. It was through the Penningtons that he was introduced in 1662 to Milton in the capacity of Latin reader. He spent nearly every afternoon in the poet's house in Jewin Street, until the intercourse was interrupted by an illness which compelled him to go to the country. After a period of imprisonment in the old Bridewell prison and in Newgate for Quakerism, Ellwood resumed his visits to Milton, who was now residing at a house his friend had taken for him at Chalfont St Giles. In 1665 Ellwood was again arrested and imprisoned in Aylesbury gaol. When he visited Milton after his release the poet gave him the manuscript of the Paradise Lost to read. On returning the manuscript Ellwood said, "Thou hast said much here of Paradise lost; but what hast thou to say of Paradise found?" and when Milton long afterwards in London showed him Paradise Regained, it was with the remark, "This is owing to you, for you put it into my head." Ellwood was a friend of Fox and Penn, and was the author of several polemical works in defence of the Quaker position, of which Forgy no Christianity (1674) and The Foundation of Tithes Shaken (1678) deserve mention. His Sacred Histories of the Old and New Testaments appeared in 1705 and 1709. He also published some volumes of poems, among them a Davides in five books. He died on the 1st of March 1714.

The History of the Life of Thomas Ellwood; written by his own hand (1714) has been many times reprinted.
ELM—ELMHAM

ELM, the popular name for the trees and shrubs constituting the genus Ulmus, of the natural order Ulmaceae. The genus contains fifteen or sixteen species widely distributed throughout the north temperate zone, with the exception of western North America, and extending southwards as far as Mexico in the New and the Sikkim Himalaya in the Old World.

The common elm, U. campestris, a doubtful native of England, is found throughout a great part of Europe, in North Africa and in Asia Minor, whence it ranges as far east as north Asia and Japan. It grows in woods and hedges, especially in the southern portion of Britain, and on almost all soils, but thrives best on a rich loam, in open, low-lying, moderately moist situations, attaining a height of 60 to 100, and in some few cases as much as 130 or 150 ft. The branches are numerous and spreading, and often pendulous at the extremities; the bark is rugged; the leaves are alternate, ovate, rough, doubly serrate, and, as in other species of Ulmus, unequal at the base. The flowers are small, hermaphrodite, numerous, in purplish-brown tufts, and each with a fringed basal bract; the bell-shaped calyx is often four-toothed and surrounds four free stamens; the pistil bears two spreading hairy styles. They appear before the leaves. In March and April, the young leaves are green, membranous, obtusely pointed and deeply cleft. Unlike the wych elm, the common elm rarely perfects its seed in England, where it is propagated by means of root suckers from old trees, or preferably by layers from stools. In the first ten years of its growth it ordinarily reaches a height of 25 to 30 ft. The wood, at first brownish white, becomes, with growth, of a brown colour having a greenish shade. It is close-grained, firm, free from knots, without apparent medullary rays, and is hard and tough, but will not take a polish. All parts of the trunk, including the sapwood, are available in carpentry. By drying, the wood loses over 60% of its weight, and has then a specific gravity of 0.588. It has considerable transverse strength, does not crack when once seasoned, and is remarkably durable under water, or if kept quite dry; though it decays rapidly on exposure to the weather, which in ten to eighteen months causes the bark to fall off, and gives to the wood a yellowish colour—a sign of deterioration in quality. To prevent shrinking and warping it may be preserved in water or mud, but it is best worked up soon after felling. Analyses of the sap of the wood have given a percentage of 47-8% of lime, 21-9% of potash, and 13-7% of soda. In summer, elm trees often exude an alkaline gummy substance, which by the action of the air becomes the brown insoluble body termed ulmin. Elm wood is used for keels and bilge-planks, the blocks and dead-eyes of rigging, and ships’ pumps, for coffins, wheels, furniture, carved and turned articles, and for general carpenters’ work; and previous to the common employment of cast iron was much in request for waterpipes. The inner bark of the elm is made into bast mats and ropes. It contains mucilage, with a little tannin acid, and was formerly much employed for the preparation of an astringent decoction, now obsolete. The bark of Ulmus fulva, the slippery or red elm of the United States and Canada, serves the North American Indians for the same purpose, and also as a vulnery. The leaves as well as the young shoots of elms have been found a suitable food for live stock. For ornamental purposes elm trees are frequently planted, and in avenues, as at the park of Stratfield Saye, in Hampshire, are highly effective. They were first introduced in France for the adornment of public walks in the reign of Francis I. In Italy, as in ancient times, it is customary to train the vine upon the elm—a practice to which frequent allusion has been made by the poets. The cork-barked elm, U. campestris, var. suberosa, is distinguished chiefly by the thick deeply fissured bark with which its branches are covered. There are numerous cultivated forms differing in size and shape of leaf, and manner of growth. The Scotch or wych elm, U. montana, is indigenous to Britain and is the common elm of the northern portion of the island; it usually attains a height of about 60 ft., but among tall-growing trees may reach 120 ft. It has drooping branches and a smoother and thinner bark, larger and more tapering leaves, and a far less deeply notched seed-venel than U. campestris. The wood, though more porous than in that species, is a tough and hard material when properly seasoned, and, being very flexible when steamed, is well adapted for boat-building. Branches of the wych elm were formerly manufactured into bows, and if forked were employed as divining-rods. The weeping elm, the most ornamental member of the genus, is a variety of this species. The Dutch or sand elm is a tree very similar to the wych elm, but produces inferior timber. The American or white elm, U. americana, is a hardy and very handsome species, of which the old tree on Boston (Mass.) Common was a representative. This tree is supposed to have been in existence before the settlement of Boston, and at the time of its destruction by the storm of the 15th of February 1876 measured 22 ft. in circumference.

ELMACIN (ELMAKIN or ELMACINUS), George (c. 1223–1274), author of a history of the Saracens, which extends from the time of Mahomet to the year 1118 of our era. He was a Christian of Egypt, where he was born; is known in the cast as Inam-Abid; and after holding an official position under the sultans of Egypt, died at Damascus. His history is principally occupied with the affairs of the Saracen empire, but it contains passages which relate to the East and to Christians. It is still preserved in Latin and Latin at Leiden in 1625. The Latin version is a translation by Erpenius, under the title, Historia saporacena, and from this a French translation was made by Wattier as L’Histoire mahométane (Paris, 1657).

ELMALI ("apple-town"), a small town of Asia Minor in the vilayet of Konia, the present administrative centre of the ancient Lycia, but not itself corresponding to any known ancient city. It lies about 25 m. inland, at the head of a long upland valley (3000 ft.) inhabited by direct descendants of the ancient Lycians, who have preserved a distinctive facial type, noticeable at once in the town population. There are about fifty Greek families, the rest of the population (4000) being Moslem. The district is agricultural and has no manufactures of importance.

ELMES, HARVEY LONSDALE (1813–1847), British architect, son of James Elmes (q.v.), was born at Chichester in 1813. After serving some time in his father’s office, and under a surveyor at Bedford and an architect at Bath, he became partner with him in 1835, and in the following year he was successful among 86 competitors for a design for St George’s Hall, Liverpool. The foundation stone of this building was laid on the 28th of June 1838, but, Elmes being successful in a competition for the Assize Courts in the same city, it was finally decided to include the hall and courts in a single building. In accordance with this idea, Elmes prepared a fresh design, and the work of erection commenced in 1841. He superintended its progress till 1847, when from failing health he was compelled to delegate his duties to Charles Robert Cockerell, and leave for Jamaica, where he died of consumption on the 26th of November 1847.

ELMES, JAMES (1782–1862), British architect, civil engineer, and writer on the arts, was born in London on the 15th of October 1782. He was educated at Merchant Taylors’ school, and, after studying architecture under his father, and architecture under George Gibson, became a student at the Royal Academy, where he gained the silver medal in 1804. He designed a large number of buildings in the metropolis, and was surveyor and civil engineer to the port of London, but is best known as a writer on the arts. In 1809 he became vice-president of the Royal Architectural Society, but this office, as well as that of surveyor of the port of London, he was compelled through partial loss of sight to resign in 1828. He died at Greenwich on the 2nd of April 1862. His publications were:—Sir Christopher Wren and his Times (1823); Lectures on Architecture (1823); The Arts and Artists (1832); General and Biographical Dictionary of the Fine Arts (1836); Treatise on Architectural Jurisprudence (1837), and Thomas Clarkson: a Monograph (1845).

ELMHAM, THOMAS (d. c. 1420), English chronicler, was probably born at North Elmham in Norfolk. He became a Benedictine monk at Canterbury, and then joining the Cluniacs, was prior of Lenton Abbey, near Nottingham; he was chaplain to Henry V., whom he accompanied to France in 1415, being present at Agincourt. Elmham wrote a history of the monastery
ELMINA—EL OBEID

297

of St Augustine at Canterbury, which has been edited by C. Hardwick for the Rolls Series (1858); and a Liber matricul of Henrici V., edited by C. A. Cole in the Memorials of Henry V. (1858). It is very probable that Elhalm wrote the famous Gesta Henrici Quinti, which is the best authority for the life of Henry V. from his accession to 1416. This work, often referred to as the “chaplain’s life,” and thought by some to have been written by Jean de Bordin, has been published for the English Historical Society by B. Williams (1809). Elhalm, however, did not write the Vita et Gesta Henrici V., which was attributed to him by T. Hearne and others.

See C. L. Kingsford, Henry V. (1901).

ELMINA, a town on the Gold Coast, British West Africa, in 3° 4’N., 1° 20’W. and about 8 m. W. of Cape Coast. Pop. about 4000. Facing the Atlantic on a rocky peninsula is Fort St George, considered the finest fort on the Guinea coast. It is built square with high walls, and has accommodation for 200 soldiers. On the land side were formerly two moats, cut in the rock on which the castle stands. The castle is the residence of the commissioner of the district and other officials. The houses in the native town are mostly built of stone, that material being plentiful in the vicinity.

Elmina is the earliest European settlement on the Gold Coast, and was visited by the Portuguese in 1481. Christopher Columbus is believed to have been one of the officers who took part in this voyage. The Portuguese at once began to build the castle now known as Fort St George, but it was not completed till eighty years afterwards. Another defensive work is Fort St Jago, built in 1666, which is behind the town and at some distance from the coast. (In the latter half of the 19th century it was converted into a prison.) Elmina was captured by the Dutch in 1637, and ceded to them by treaty in 1640. They made it the chief port for the produce of Ashanti. With the other Dutch possessions on the Guinea coast, it was transferred to Great Britain in April 1872. The king of Ashanti, claiming to be ground landlord, objected to its transfer, and the result was the Ashanti war of 1873-1874. For many years the greatest output of gold from this coast came from Elmina. The annual export is said to have been nearly 5,000,000 in the early years of the 18th century, but the figure is probably exaggerated. Since 1854 the bulk of the export trade in gold has been transferred to Sekondi (q.v.). Prempeh, the ex-king of Ashanti, was detained in the castle (1896) until his removal to the Seychelles. (See ASHANTI: HISTORY, and GOLD COAST: History.)

ELMIRA, a city and the county-seat of Chemung county, New York, U.S.A., 100 m. S.E. of Rochester, on the Chemung river, about 850 ft. above sea-level. Pop. (1800) 30,803; (1900) 35,672, of whom 5511 were foreign-born (1888 Irish and 1208 German); (1910 census) 37,176. It is served by the Erie, the Pennsylvania, the Delaware, Lackawanna & Western, the Lehigh Valley, and the Tioga Division railways, the last of which connects it with the Pennsylvania coalfields 48 m. away. The city is attractively situated on both sides of the river, and has a fine water-supply and park system, among the parks being Eldridge, Rollick’s Glen, Riverside, Brand, Diven, Grove, Maple Avenue and Wisner; in the last-named is a statue of Thomas K. Beecher by J. S. Hartley. The city contains a Federal building, a state armoury, the Chemung county court house and other county buildings, the Elmina orphans’ home, the Steele Memorial library, home for the aged, the Armot-Oglen memorial hospital, the Elmina free academy, and the Railway Commercial training school. Here, also, is Elmira College (Presbyterian) for women, founded in 1855. This institution, chartered in 1853 as Auburn Female University and then situated in Auburn, was rechartered in 1853 as the Elmira Female College; it was established largely through the influence and persistent efforts of the Rev. Samuel Robbins Brown (1810-1880) and his associates, notably Simeon Benjamin of Elmira, who gave generously to the newly founded college, and was the first distinctively collegiate institution for women in the United States, and the first, apparently, to grant degrees to women. The most widely known institution in the city is the Elmira reformatory, a state prison for first offenders between the ages of sixteen and thirty, on a system of general indeterminate sentences. Authorized by the state legislature in 1866 and opened in 1876 under the direction of Zebulun Reed Brockway (b. 1827), it was the first institution of the sort and has served as a model for many similar institutions both in the United States and in other countries (see Juvenile Offenders). Elmira is an important railway centre, with large repair shops, and has also extensive manufactories (value of production in 1900, $8,558,786, of which $6,956,603 was produced under the “factory system”; in 1905, under the “factory system,” $6,084,903), including boot and shoe factories, a large factory for fire-extinguishing apparatus, iron and steel bridge works, steel rolling mills, large valve works, steel plate mills, knitting mills, furniture, glass and boiler factories, breweries and silk mills. Near the site of Elmira occurred on the 29th of August 1779 the battle of Newtown, in which General John Sullivan decisively defeated a force of Indians and Tories under Sir John Johnson and Joseph Brant. There were some settlers here at the close of the War of Independence, but no permanent settlement was made until 1788. The village was incorporated as Newtown in 1815, and was reincorporated as Elmira in 1828. A federal charter was secured in 1834. In 1861 a state military camp was established here and in 1864-1865 there was a prison camp here for Confederate soldiers.

ELMSHORN, a town of Germany, in the Prussian province of Schleswig-Holstein, on the Krückau, 19 m. by rail N.W. from Altona. Pop. (1905) 36,640. Its industries include weaving, dyeing, brewing, iron-founding and the manufacture of leather goods, boots and shoes and machines. There is a considerable shipping trade.

ELMSLEY, PETER (1773-1825), English classical scholar. He was educated at Westminster and Christ Church, Oxford, and having inherited a fortune from his uncle, a well-known bookseller, devoted himself to the study of classical authors and manuscripts. In 1798 he was appointed to the chapelry of Little Horkesley in Essex, which he held till his death. He travelled extensively in France and Italy, and spent the winter of 1818 in examining the MSS. in the Laurentian library at Florence. In 1819 he was commissioned, with Sir Humphry Davy, to decipher the papyri found at Herculaneum, but the results proved insignificant. In 1823 he was appointed principal of St Alban’s Hall, Oxford, and was professor of ancient history. He died in Oxford on the 8th of May 1825. Elmsley was a man of most extensive learning and European reputation, and was considered to be the best ecclesiastical scholar in England. But it is chiefly by his collation of the MSS. of the Greek tragedians and his critical labours on the restoration of their text that he will be remembered. He edited the Acharnians of Aristophanes, and several of the plays and scholia of Sophocles and Euripides. He was the first to recognize the importance of the Laurentian MS. (see Sandys, Hist. of Class. Schol. iii. (1908).

ELNE, a town of south-western France in the department of Pyrénées-Orientales, 10 m. S.S.E. of Perpignan by rail. Pop. (1906) 3026. The hill on which it stands, once washed by the sea, which is now over 3 m. distant, commands a fine view over the plain of Roussillon. From the 6th century till 1602 the town was the seat of a bishopric, which was transferred to Perpignan. The cathedral of St Eulalie, a Romanesque building completed about the beginning of the 12th century, has a beautiful cloister in the same style, with interesting sculptures and three early Christian sarcophagi. Remains of the ancient ramparts flanked by towers are still to be seen. Silk-worm cultivation is carried on. Elne, the ancient Uluberes, was named Helen by the emperor Constantine in memory of his mother. Hannibal encamped under its walls on his march to Rome in 218 B.C. The emperor Constans was assassinated there in A.D. 350. The town several times sustained siege and capture between its occupation by the Moors in the 8th century and its capitulation in 1641 to the troops of Louis XIII.

EL OBEID, chief town of the mudiria (province) of Kordofan, Anglo-Egyptian Sudan, and 230 m. S.W. by S. of Khartum in
a direct line. Pop. (1905) about 10,000. It is situated about 2,000 ft. above the sea, at the northern foot of Jebel Kordofan, in 13° 11' N. and 30° 14' E. It is an important trade centre, the chief articles of commerce being gum, ivory, cattle and ostrich feathers. A considerable part of the trade of Darfur with Egypt passes through El Obeid.

El Obeid, which appears to be a place of considerable antiquity and the ancient capital of the country, was garrisoned by the Egyptians on their conquest of Kordofan in 1821. In September 1882 the town was assaulted by the troops of the mahdi, who, being repulsed, laid siege to the place, which capitulated on the 17th of January 1883. During the Mahdist war the city was destroyed and deserted, and when Kordofan passed, in 1899, into the possession of the Anglo-Egyptian authorities nothing was left of El Obeid but a part of the old government offices. A new town was laid out in squares, the mudiria repaired and barracks built. (See KORDOFAN and SUDAN: Anglo-Egyptian.)

ELOI [ELIGIUS]. SAINT (586-659), apostle of the Belgians and Frisians, was born at Cadulle, near Limoges, in 586. Having at an early age shown artistic talent he was placed by his parents with the master of the mint at Limoges, where he made rapid progress in goldsmith's work. He became coiner to Clotaire II., king of the Franks, and treasurer to his successor Dagobert. Both kings entrusted him with important works, among which were the composition of the base-reliefs which ornament the tomb of St Germain, bishop of Paris, and the execution (for Clotaire) of two chairs of gold, adorned with jewels, which at that time were reckoned chefs-d'œuvre. Though he was amassing great wealth, Eloi acquired a distaste for a worldly life, and resolved to become a priest. At first he retired to a monastery, but in 640 was raised to the bishopric of Noyon. He made frequent missionary excursions to the pagans of the Low Countries, and also founded a great many monasteries and churches. He died on the 1st of December 659. A mass of legend has gathered round the life of St Eloi, who as the patron saint of goldsmiths is still venerated.

ELONGATION, strictly "lengthening"; in astronomy, the apparent angular distance of a heavenly body from its centre of motion, as seen from the earth; designating especially the angular distance of the planet Mercury or Venus from the sun, or the apparent angle between a satellite and its primary. The greatest elongation of Venus is about 45°; that of Mercury generally ranges between 18° and 27°.

ELOI, SAINT—ELPHINSTONE, MOUNTSTUART

EL PASO, a city, port of entry, and the county-seat of El Paso county, Texas, U.S.A., on the E. bank of the Rio Grande, in the extreme W. (see map of Texas, p. 3710). Pop. (1880) 776; (1890) 2,938; (1900) 15,906; of which 1,609 were foreign-born and 486 were negroes; (1910 census) 39,279.

Many of the inhabitants are of Mexican descent. El Paso is an important railway centre and is served by the following railways: the Atchison, Topeka & Santa Fé, of which it is the S. terminus; the El Paso & South-Western, which connects with the Chicago, Rock Island & El Paso (of the Rock Island system); the Galveston, Harrisburg & San Antonio, of which it is the W. terminus; the Mexican Central, of which it is the N. terminus; the Texas & Pacific, of which it is the W. terminus; a branch of the Southern Pacific, of which it is the E. terminus; and the short Rio Grande, Sierra Madre & Pacific, of which it is the N. terminus. The city is regularly laid out on level bottom lands, stretching to the tablelands and slope to the N.E. and N.W. of the city. Opposite, on the W. bank of the river, is the Mexican town of Ciudad Juarez (until 1889 known as Paso del Norte), with which El Paso is connected by bridges and by electric railway. The climate is mild, warm, and dry. El Paso being well known as a health resort, particularly for sufferers from pulmonary complaints. Among the city's public buildings are a handsome Federal building, a county court house, a city hall, a Y.M.C.A. building, a public library, a sanatorium for consumptives, and the Hotel Delano, a hospital maintained by Roman Catholics. El Paso is the seat of St Joseph's Academy and of the El Paso Military Institute. Three miles E. of the city limits is Fort Bliss, a U.S. military post, with a reservation of about 2 sq. m. El Paso's situation on the Mexican frontier gives it a large trade with Mexico; it is the port of entry of the Paso del Norte customs district, one of the larger Mexican border districts, and in 1908 its imports were valued at $2,677,784 and its exports at $5,661,901. Wheat, boots and shoes, mining machinery, cement, lime, lumber, beer, and denatured alcohol are among the varied exports; the principal imports are ore, sugar, cigars, oranges, drawn work and Mexican curios. El Paso has extensive manufactories, especially railway car shops, which in 1905 employed 34.5% of the factory wage-earners. Just outside the city limits are important lead smelting works, to which are brought ores for treatment from western Texas, northern Mexico, New Mexico and Arizona. Among the city's manufactures are cement, denatured alcohol, ether, varnish, clothing and canned goods. The value of the city's total factory product in 1905 was $2,377,813, 66% greater than that in 1900. El Paso lies in a fertile agricultural valley, and in 1908 the erection of an immense dam was begun near Engle, New Mexico (100 m. above El Paso), by the U.S. government, to store the flood waters of the Rio Grande for irrigating this area. Before the Mexican War, following which the first United States settlement was made, the site of El Paso was known as Ponce de Leon Ranch, the land being owned by the Ponce de Leon family. El Paso was first chartered as a city in 1873, and in 1907 adopted the commission form of government.

ELPHINSTONE, MOUNTSTUART (1779-1839), Indian statesman and historian, fourth son of the 11th Baron Elphinstone in the peerage of Scotland, was born in 1779. Having received an appointment in the civil service of the East India Company, of which one of his uncles was a director, he reached Calcutta in the beginning of 1796. After filling several subordinate posts, he was appointed in 1804 assistant to the British resident at Poona, at the court of the peshwa, the most powerful of the Mahratta princes. Here he obtained his first opportunity of distinction, being attached in the capacity of diplomatist to the mission of Sir Arthur Wellesley to the Mahrattas. When, on the failure of negotiations, war broke out, Elphinstone, though a civilian, acted as virtual aide-de-camp to General Wellesley. He was present at the battle of Assaye, and displayed such courage and knowledge of tactics throughout the whole campaign that Wellesley told him he had mistaken his profession, and that he ought to have been a soldier. In 1804, when the war closed, he was appointed British resident at Nagpur. Here, the times being uneventful and his duties light, he occupied much of his leisure in reading classical and general literature, and acquired those studious habits which clung to him throughout life. In 1808 he was appointed the first British envoy to the court of Kabul, with a friendly alliance with the Afghans; but this proved of little value, for the pasha was driven from the throne by his brother before it could be ratified. The most valuable permanent result of the embassy was the literary fruit it bore several years afterwards in Elphinstone's great work on Kabul. After spending about a year in Calcutta arranging the report of his mission, Elphinstone was appointed in 1811 to the important and difficult post of resident at Poona. The difficulty arose from the general complication of Mahratta politics, and especially from the weak and treacherous character of the peshwa, which Elphinstone rightly read from the first. While the mask of friendship was kept up Elphinstone carried out the only suitable policy, that of vigilant quiescence, with admirable tact and patience; when in 1817 the mask was thrown aside and the peshwa ventured to declare war, the English resident proved for the second time the truth of Wellesley's assertion that he was born a soldier. Though his own account of his share in the campaign is characteristically modest, one can gather from it that the success of the British troops was
chiefly owing to his assuming the command at an important crisis during the battle of Kirkee.

The peshwa being driven from his throne, his territories were annexed to the British dominions, and Elphinstone was nominated commissioner to administer them. He discharged the responsible task with rare judgment and ability. In 1819 he was appointed lieutenant-governor of Bombay and held this post till 1827, his principal achievement being the compilation of the "Elphinstone code." He may fairly be regarded as the founder of the system of state education in India, and he probably did more than any other Indian administrator to further every likely scheme for the promotion of native education. His connexion with the Bombay presidency was appropriately commemorated in the endowment of the Elphinstone College by the native communities, and in the erection of a marble statue by the European inhabitants.

Returning to England in 1829, after an interval of two years' travel, Elphinstone retained in his retirement and enfeebled health an important influence on public affairs. He twice refused the offer of the governor-generalship of India. Long before he had returned to Scotland as hero of the war by his Account of the Kingdom of Cahl and its Dependencies in Persia and India (1815). Soon after his arrival in England he commenced the preparation of a work of wider scope, a history of India, which was published in 1841. It embraces the Hindu and Mahomedan periods, and is still a work of high authority. He died on the 20th of November 1850.

See J. S. Cotton, Mountstuart Elphinstone ("Rulers of India" series, 1892); T. E. Colebrooke, Life of Mountstuart Elphinstone (1884); and G. W. Forrest, Official Writings of Mountstuart Elphinstone (1884).

ELPHINSTONE, WILLIAM (1431–1514), Scottish statesman and prelate, founder of the university of Aberdeen, was born in Glasgow, and educated at the university of his native city, taking the degree of M.A. in 1452. After practising for a short time as a lawyer in the church courts, he was ordained priest, becoming rector of St. Michael's church, Trongate, Glasgow, in 1465. Four years later he went to continue his studies at the university of Paris, where he became reader in canon law, and then, proceeding to Orleans, became lecturer in the university there. Before 1474 he had returned to Scotland, and was made rector of the university, and official of the see of Glasgow. Further promotion followed, but no more important duties were entrusted to Elphinstone, who was made bishop of Ross in 1481. He was a member of the Scots parliament, and was sent by King James III. on diplomatic errands to Louis XI. of France, and to Edward IV. of England; in 1483 he was appointed bishop of Aberdeen, although his consecration was delayed for four years; and he was sent on missions to England, both before and after the death of Richard III. in 1485. Although he attended the meetings of parliament with great regularity he did not neglect his episcopal duties, and the fabric of the cathedral of Aberdeen owes much to his care. Early in 1488 the bishop was made lord high chancellor, but on the king's death in the following June he vacated this office, and retired to Aberdeen. As a diplomatist of repute, however, his services were quickly required by the new king, James IV., in whose interests he visited the kings of England and France, and the German king Maximilian I. Having been made keeper of the privy seal in 1492, and having arranged a dispute between the Scotch and the Dutch, the bishop's concluding years were mainly spent in the foundation of the university of Aberdeen. The papal bull for this purpose was obtained in 1404, and the royal charter which made old Aberdeen the seat of a university is dated 1498. A small endowment was provided by the king, and the university, modelled on that of Paris and intended principally to be a school of law, soon became the most famous and popular of the Scots seats of learning, a result which was largely due to the wide experience and ripe wisdom of Elphinstone and of his friend, Hector Bocce, the first rector. The building of the college of the Holy Virgin in Nativity, now King's College, was completed in 1506, and the bishop also rebuilt the choir of his cathedral, and built a bridge over the Dee. Continuing to participate in public affairs he opposed the policy of hostility towards England which led to the disaster at Flodden in September 1513, and died in Edinburgh on the 25th of October 1514. Elphinstone was partly responsible for the introduction of printing into Scotland, and for the production of the Breveariwm Aberdonense. He may have written some of the lives in this collection, and gathered together materials concerning the history of Scotland; but he did not, as some have thought, continue the Scottish chronicle, nor did he write the Lives of Scottish Saints.

See Hector Bocce, Marbellacium et Aberdonensis episcoporum vitae, edited and translated by J. Mair (Aberdeen, 1894); Fasti Abbeunicum, ed. James (Aberdeen, 1854); and A. Gardyne, Theatre of Scottish Worthies and Lyf of W. Elphinston, edited by D. Laing (Aberdeen, 1878).

EL RENO, a city and the county-seat of Canadian county, Oklahoma, U.S.A., on the N. fork of the Canadian river, about 26 m. W. of Oklahoma City. Pop. (1890) 285; (1900) 3385; (1907) 5370 (401 were of negro descent and 7 were Indians); (1910) 7872. It is served by the Chicago, Rock Island & Pacific, the Choctaw, Oklahoma & Gulf (owned by the Chicago, Rock Island & Pacific), El Reno & Western railways, the last extending from El Reno to Guthrie. El Reno lies on the rolling prairie lands, about 1360 ft. above the sea, an Indian corn, wheat, oats and cotton-producing and dairying region, and has a large grain elevator, a cotton compress, and various manufacturing establishments, among the products being flour, canned goods and crockery. El Reno has a Carnegie library, and within the city's limits is Bellamy's Lake (180 acres), a favourite resort. Near the city is a Government boarding school for the Indians of the Cheyenne and the Arapaho Reservation. Fort Reno, a U.S. military post, was established near El Reno in 1876, and in 1908 became a supply depot of the quartermaster's department under the name of "Fort Reno Remount Depot." The first settlement here, apart from the fort, was made in the autumn of 1888; in 1892 El Reno received a city charter.

ELSLETH, a maritime town of Germany, in the grand-duchy of Oldenburg, in a fertile district at the confluence of the Hunte with the Weser, on the railway Hude-Nordenham. Pop. 2000. It has an Evangelical church, a school of navigation, a harbour and docks. It has considerable trade in corn and timber and is one of the centres of the North Sea herring fishery.

ELSINORE (Dan. Helsingör), a seaport of Denmark in the amt (county) of Frederiksborg, on the east coast of the island of Zealand, 28 m. N. of Copenhagen by rail. Pop. (1901) 13,902. It stands at the narrowest part of the Sound, opposite the Swedish town of Helsingborg, 3 m. distant. Communication is maintained by means of a steam ferry. Its harbour admits vessels of 20 ft. draught, and the roadstead affords excellent anchorage. There are shipbuilding yards, with foundry, engineering shops, &c.; the chief export is agricultural produce; imports, iron, coal, cereals and yarn. Helsingor received town privileges in 1425. In 1522 it was taken and burnt by Lübeck, but in 1535 was retaken by Christian II. It is celebrated as the Elsinore of Shakespeare's tragedy of Hamlet, and was the birthplace of Saxo Grammaticus, from whose history the story of Hamlet is derived. A pile of rocks surrounded by trees is shown as the place of the Broadmoor, and Ophelia's brook is also pointed out, but both are, of course, inventions. On a tongue of land east of the town stands the castle of Kronberg or Kronberg, a magnificent, solid and venerable Gothic structure built by Frederick II. towards the end of the 13th century, and extensively restored by Christian IV. after a fire in 1637. It was taken by the Swedes in 1658, but its possession was again given up to the Danes in 1660. From its turrets, one of which serves as a lighthouse, there are fine views of the straits and of the neighbouring countries. The Flag Battery is the "platform before the castle" where the ghost appears in Hamlet. Within it the principal object of interest is the apartment in which Matilda, queen of Christian VII. and sister of George III. of England, was imprisoned before she was taken to Hanover. The chapel contains fine wood-carving of the 17th century. North-west of the town...
is Marienlyst, originally a royal château, but now a seaside
resort.

ELSSLER, FANNY (1810–1884), Austrian dancer, was born in
Vienna on the 23rd of June 1810. From her earliest years she
was trained for the ballet, and made her appearance at the
Kärntner-Thor theatre in Vienna before she was seven. She
almost invariably danced with her sister Theresa, who was two
years her senior; and, after some years’ experience together in
Vienna, the two went in 1827 to Naples. Their success there—
to which Fanny contributed more largely than her sister, who
used to efface herself in order to heighten the effect of Fanny’s
more brilliant powers—led to an engagement in Berlin in 1830.
This was the beginning of a series of triumphs for Fanny’s
personal beauty and skill in dancing. After captivating all
hearts in Berlin and Vienna, and inspiring the aged statesman
Friedrich von Gentz (q.v.) with a remarkable passion, she paid a
visit to London, where she received much kindness at the
hands of Mr and Mrs Grote, who practically adopted the little
girl who was born three months after the mother’s arrival in
England. In September 1834 Fanny Elssler appeared at the
Opera in Paris, a step to which she looked forward with much
misgivings on account of Taglioni’s supremacy on that stage.
The result, however, was another triumph for her, and the
temporary eclipse of Taglioni, who, although the finer artist of
the two, could not for the moment compete with the new-
comeer’s personal fascination. It was conspicuously in her
performance of the Spanish cachucha that Fanny Elssler outshone
all rivals. In 1840 she sailed with her sister for New York, and
after two years’ unimixed success they returned to Europe,
where during the following five years Fanny appeared in Germany,
Austria, France, England and Russia. In 1845, having amassed
a fortune, she retired from the stage and settled near Hamburg.
A few years later her sister Theresa contracted a morganatic
marriage with Prince Adalbert of Prussia, and was ennobled
under the name of von Alvensleben. Fanny Elssler died in
Vienna on the 27th of November 1884. Theresa was left a
widow in 1873, and died on the 19th of November 1878.

ELSTER, the name of two rivers of Germany. (1) The
Schwarze (Black) Elster rises in the Lausitz range, on the
southern border of Saxony, flows N. and N.W., and after a course
of 112 m. enters the Elbe a little above Wittenberg. It is a
 sluggish stream, winding its way through sandy soil and
frequently along a divided channel. (2) The Weisse (White)
Elster rises in the north-western corner of Bohemia, a little
north of Eger, cuts through the Vogtland in a deep and pictur-
esque valley, passing Plauen, Greiz, Gera and Zeitz on its way
north to Leipzig, just below which city it receives its most
important tributary, the Pleisse. At Leipzig it divides, the
main stream turning north-west and entering the Saale from
the right a little above Halle; the other arm, the Luppe,
flowing parallel to the main stream and south of it enters the
Saale below Merseburg. Total length, 127 m.; total descent,
1386 ft.

ELSTER, a spa and inland watering-place of Germany, in
the kingdom of Saxony, on the Weisse Elster, close to the
Bohemian frontier on the railway Plauen-Eger, and 20 m. S.
of the former. It has some industries of lace-making and weaving,
and a population of about 2000, in addition to visitors. The
mineral springs, saline-chalybeate, specific in cases of nervous
disorders and feminine ailments, have been lately supplemented
by baths of various kinds, and these, together with the natural
attractions of the place as a climatic health resort, have com-
bined to make it a fashionable watering-place during the summer
season. The number of visitors amounts annually to about
10,000.

See Flechsig, Bad Elster (Leipzig, 1884).

ELSLOW, a ward of the city of Newcastle-upon-Tyne,
England, in the western part of the borough, bordering the
River Tyne. The name is well known in connexion with the great
Elswick Park, attached to the old mansion of the same name, is
now a public recreation ground.

EL TEB, a halting-place in the Anglo-Egyptian Sudan near
the coast of the Red Sea, 9 m. S.W. of the port of Trinkitat
on the road to Tokar. At El Teb, on the 4th of February 1884,
a heterogeneous force under General Valentine Baker, marching
to the relief of the Egyptian garrison of Tokar, was completely
routed by the Mahdists (see Egypt: Military Operations).

ELTON, CHARLES ISAAC (1839–1900), English lawyer
and antiquary, was born at Southampton on the 6th of December
1839. Educated at Cheltenham and Balliol College, Oxford, he
was elected a fellow of Queen’s College in 1862. He was called
to the bar at Lincoln’s Inn in 1865. His remarkable knowledge
of old real property law and custom helped him to an extensive
conveyancing practice and he took silk in 1885. He sat in the
House of Commons for West Somerset in 1884–1885 and from
1886 to 1892. In 1860 he succeeded to his uncle’s property of
Whiteasterne, near Chard, in Somerset. During the later
years of his life he retired to a great extent from legal practice,
and devoted much of his time to literary work. He died at
Whiteasterne on the 23rd of April 1900. Elton’s principal
works were The Tenures of Kent (1867); Treatise on Commons
and Waste Lands (1868); Law of Copyholds (1874); Origins
of English History (1882); Custom and Tenant Right (1882).

ELTVILLE (Elfeld), a town of Germany, in the Prussian
province of Hesse-Nassau, on the right bank of the Rhine, 5 m. S.W. from Wiesbaden, on the railway Frankfurt-on-Main-
Cologne, and with a branch to Schlangenbad. Pop. 3700.
It has a Roman Catholic and a Protestant church, ruins of a
feudal castle, a Latin school, and a monument to Gutenberg.
It has a considerable trade in the wines of the district and
two manufactories of sparkling wines. Eltville (originally
Adelbocl, Lat. Altavilla) is first mentioned in a record of the year 882.
It was given by the emperor Otto I. to the archbishops of Mainz,
who often resided here. It received town rights in 1337 and
was a place of importance during the middle ages. In 1465
Gutenberg set his press at Eltville, under the patronage of
Archbishop Adolphus of Nassau, shortly afterwards handing over its use
to the brothers Heinrich and Nikolaus Rechtemünz.
Several costly early examples of printed books issued by this press
survive, the earliest being the Vocabularium Latino-Teutonicum,
first printed in 1467.

ELTZ, a small river of Germany, a left bank tributary of the
Mosel. It rises in the Elfge range, and, after a course of 5 m.,
joins the latter river at Moselkern. Just above its confluence
stands the romantic castle of Eltz, crowning a rocky summit
900 ft. high, and famous as being one of the best preserved
medieval strongholds of Germany. It is the ancestral seat of
the counts of Elt and contains numerous antiquities.

See Roth, Geschichte der Herren und Grafen zu Eltz (2 vols., Mainz,
1895–1890).

ELVAS, an episcopal city and frontier fortress of Portugal,
in the district of Portalegre and formerly included in the province
of Alentejo; 170 m. E. of Lisbon, and 10 m. W. of the Spanish
fortress of Badajoz, by the Madrid-Badajoz-Lisbon railway.
Pop. (1900) 13,981. Elvas is finely situated on a hill 3 m. N.W.
of the river Guadiana. It is defended by seven bastions and the
two forts of Santa Luzia and Nossa Senhora da Graça.
Its late Gothic cathedral, which has also many traces of Moorish
influence in its architecture, dates from the reign of Emanuel I.
(1405–1521). A fine aqueduct, 4 m. long, supplies the city with
pure water; it was begun early in the 15th century and com-
pleted in 1622. For some distance it includes four tiers of super-
imposed arches, with a total height of 120 ft. The surrounding
lowlands are very fertile, and Elvas is celebrated for its excellent
olives and plums, the last-named being exported, either fresh
or dried, in large quantities. Brandy is distilled and pottery
manufactured in the city. The fortress of Campo Maior 1 m. N.E., is
famous for its siege by the French and relief by the
British under Marshal Beresford in 1811—an exploit com-
memorated in a ballad by Sir Walter Scott.

Elvas is the Roman Alpesa or Helvas, the Moorish Balsach,
the Spanish Velas. It was wrested from the Moors by Alphonso
VIII. of Castile in 1166; but was temporarily recaptured.
before its final occupation by the Portuguese in 1226. In 1570 it became an episcopal see. From 1642 until modern times it was the chief frontier fortress S. of the Tagus; and it twice withstood sieges by the Spanish, in 1658 and 1711. The French under Marshal Junot took it in March 1808, but evacuated it in August, after the conclusion of the convention of Cintra (see Peninsular War).

ELVEY, SIR GEORGE JOB (1816-1893), English organist and composer, was born at Canterbury on the 27th of March 1816. He was a chorister at Canterbury cathedral under Highmore Skeltes, the organist. Subsequently he became a pupil of his elder brother, Stephen, and then studied at the Royal Academy of Music under Cipriani Potter and Dr Crotch. In 1834 he gained the Gresham prize medal for his anthem, "Bow down thine ear," and in 1835 was appointed organist of St George's chapel, Windsor, a post he filled for 47 years, retiring in 1882. He took the degree of Mus. B. at Oxford in 1838, and in 1840 that of Mus.D. Anthems of his were commissioned for the Three Choirs Festivals of 1853 and 1857, and in 1871 he received the honour of knighthood. He died at Wandleham in Surrey on the 9th of December 1893. His works, which are nearly all for the Church, include two oratorios, a great number of anthems and services, and some pieces for the organ. A memoir of him, by his widow, was published in 1894.

ELVIRA, SYNOW OF, an ecclesiastical synod held in Spain, the date of which cannot be determined with exactness. The solution of the question hinges upon the interpretation of the canons, that is, upon whether they are to be taken as reflecting a recent, or as pointing to an imminent, persecution. Thus some argue for a date between 300 and 303, i.e., before the Diocletian persecution; others for a date between 303 and 314, after the persecution, but before the synod of Arles; still others for a date between the synod of Arles and the council of Nicaea, 325. Mansi, Hardouin, Hefele and Dale are in substantial agreement upon 305 or 306, and this is probably the closest approximation now possible in the present state of the evidence. The place of meeting, Elvira, was not far from the modern Granada, if not, as Dale thinks, actually identical with it. There the nineteen bishops and twenty-four presbyters, from all parts of Spain, but chiefly from the south, assembled, probably at the instigation of Hosius of Cordova, but under the presidency of Felix of Accis, with a view to restoring order and discipline in the church. The eighty-one canons which were adopted reflect with considerable fullness the internal life and external relations of the Spanish Church of the 4th century. The social environment of Christians may be inferred from the canons prohibiting marriage and other intercourse with Jews, pagans and heathens, closing the offices of flamen and duumvir to Christians, forbidding all contact with idolatry and likewise participation in pagan festivals and public games. The state of morals is mirrored in the canons denouncing prevalent vices. The canons respecting the clergy exhibit the clergy as already a special class with peculiar privileges, a more exacting moral standard, heavier penalties for delinquency. The bishop has acquired control of the sacraments, presbyters and deacons acting only under his orders; the episcopate appears as a unit, bishops being bound to respect one another's disciplinary decrees. Worthy of special note are canon 33, enjoining celibacy upon all clerics and all who minister at the altar (the most ancient canon of celibacy); canon 36, forbidding pictures in churches; canon 38, permitting lay baptism under certain conditions; and canon 53, forbidding one bishop to restore a person excommunicated by another.

EL WAD, a town in the Algerian Sahara, 125 m. in a straight line S.S.E. of Biskra, and 190 m. W. by S. of Gabes. Pop. (1906) 7586. El Wad is one of the most interesting places in Algeria. It is surrounded by huge hollows containing noble palm groves; and beyond these on every side stretches the limitless desert with its great billows of sand, the encroachments of which on the oasis are only held at bay by ceaseless toil. The town itself consists of a mass of one-storied stone houses, each surmounted by a little dome, clustering round the market-place with its mosque and minaret. By an exception rare in Saharan settlements, there are no defensive works save the fort containing the government offices, which the French have built on the south side of the town. The inhabitants are of two distinct tribes, one, the Aduan, of Berber stock, the other a branch of the Sha'ambah Arabs. El Wad possesses a curious currency known as flos, consisting of obsolete copper coins of Algerian and Tunisian dynasties. Seven flous are regarded as equal to the French five-centime piece.

El Wad oasis is one of a group known collectively as the Suf. Five miles N.W. is Kuineine (pop. 3541) and 6 m. farther N.W. Guemar (pop. 6883), an ancient fortified town noted for its manufacture of carpets. Linen weaving is carried on extensively in the Suf. Administratively El Wad is the capital of an annexe to the territory of Tuggurt.

ELWOOD, a city of Madison county, Indiana, U.S.A., on Duck Creek, about 38 m. N.E. of Indianapolis. Pop. (1880) 751; (1890) 2284; (1900) 12,950 (1886 foreign-born); (1910) 11,028. Elwood is served by the Lake Erie & Western and the Pittsburg, Cincinnati, Chicago & St. Louis railways, and by an interurban electric line. Its rapid growth in population and as a manufacturing centre was due largely to its situation in the natural gas region; the failure of the gas supply in 1903 caused a decrease in manufacturing, but the city gradually adjusted itself to new conditions. It has large plate mills, iron and steel foundries, saw and planing mills, wooden-ware and furniture factories, bottling works and lamp-chimney factories, flour mills and packing houses. In 1905 the value of the city's factory product was $6,111,083; in 1909 it was $9,435,513; the glass product was valued at $223,766 in 1905, and at $8,011,903 in 1909. There are extensive brick-yards in the vicinity, and the surrounding agricultural country furnishes large supplies of grain, live-stock, poultry and produce, for which Elwood is the shipping centre. The site was first settled under the name of Quincy; the present name was adopted in 1899; and in 1891 Elwood received a city charter.

ELY, RICHARD THEODORE (1834-1905), American economist, was born at Ripley, New York, on the 13th of April 1834. Educated at Columbia and Heidelberg universities, he held the professorship of economics at Johns Hopkins University from 1881 to 1892, and was subsequently professor of economics at Wisconsin University. Professor Ely took an active part in the formation of the American Economic Association, was president from 1885 to 1892 and president from 1899 to 1901. He published a useful Introduction to Political Economy (1889); Outlines of Economics (1893); The Labour Movement in America (1883); Problems of To-day (1888); Social Aspects of Christianity (1886); Socialism and Social Reform (1894); Monopolies and Trusts (1900), and Studies in the Evolution of Industrial Society (1911).

ELY, a cathedral city and market-town, in the Newmarket parliamentary division of Cambridgeshire, England, 16 m. N.N.E. of Cambridge by the Great Eastern railway. Pop. of urban district (1901) 7713. It stands on a considerable eminence on the west (left) bank of the Ouse, in the Isle of Ely, which rises above the surrounding fens. Thus its situation, before the great drainage operations of the 17th century, was practically insular. The magnificent cathedral, towering above the town, is a landmark far over the wide surrounding level. The soil in the vicinity is fertile and market-gardening is carried on, fruit and vegetables (especially asparagus) being sent to the London markets. The town has a considerable manufacture of tobacco pipes and earthenware, and there are in the neighbourhood mills for the preparation of oil from flax, hemp and colseed. Besides the cathedral Ely has in St Mary's church, lying almost under the shadow of the greater building, a fine structure ranging in style from Norman to Perpendicular, but in the main Early English. The sessions house and corn exchange are the
principal public buildings. The grammar school, founded by Henry VIII in 1541, occupies (together with other buildings) the room over the gateway of the monastery, known as the Porta, and the chapel built by Prior John de Cranden (1321-1341) is restored to use as a school chapel. A theological college was founded in 1576 and opened in 1881.

The foundation of the present cathedral was laid by its first Norman abbot, Simeon, in 1083. But the reputation of Ely had been established long before Etheldreda’s (Æthelthryth) daughter, Anna, king of East Anglia, was married to Egfrith, king of Northumbria, against her will, as she had vowed herself wholly to a religious life. Her husband opposed himself to her vow, but with the help of Wilfrid, archbishop of York, she took the veil, and found refuge from her husband in the marsh-girt Isle of Ely. Here she founded a religious house, in all probability a mixed community, in 673, becoming its first abbess, and giving the whole Isle of Ely to the foundation. In 870 the monastery was destroyed by the Danes, as were also the neighbouring foundations at Soham, Thorney, Crowland and Peterborough, and it remained in ruins till 970, when Ethelwold, bishop of Winchester, founded a new Benedictine monastery here. King Edgar in 970 endowed the monks with the former possessions of the convent and also granted them the secular causes of two hundreds within and of five hundreds without the marshes, all charges belonging to the king in secular disputes in all their lands and every fourth penny of public revenue in the province of Grantaecese. The wealth and importance of Ely rose, and its abbots held the post of chancellors of the king’s court alternately with the abbots of Glastonbury and of St Augustine’s, Canterbury.

But Ely again became a scene of contest in the desperate final struggle against William the Conqueror of which Hereward “the Wake” was the hero. Finally, in 1071, the monks agreed to surrender the Isle of Ely to the king on condition of the confirmation of all the possessions and privileges, held by them in the time of the Confessor. Abbot Simeon (1083-1100), who now began the reconstruction of the church, was related to William and brother to Wulfelin, first Norman bishop of Winchester. Under Abbot Richard (1100-1107) the translation from the Saxon church of the bodies of St Etheldreda and of the two abbesses who had followed her, and their enshrinement in the new edifice, took place; and it was due to the honour in which the memory of the foundresses was held that Ely maintained the position of dignity which it kept henceforth until the dissolution of the monasteries. The feast of St Etheldreda, or St Awdrey as she was generally called, was the occasion every year for a large fair here, at which “trilling objects” were sold to pilgrims by way of souvenirs; whence the word “tawley,” a contraction of St Awdrey. In 1199 the Isle of Ely, most of Cambridgeshire, and the abbeys of Thorney and Cetwich were separated from the diocese of Lincoln, and converted into a new diocese, Ely being the seat of the bishopric, and after 1218 the abbeys of Ely and Crowland were united to form the cathedral see of Ely (1254). The diocese is extensive. It covers nearly the whole of Cambridgeshire, Huntingdonshire and Bedfordshire, part of Suffolk, and small portions of Essex, Norfolk, Northamptonshire, Hertfordshire and Buckinghamshire.

The cathedral is a cruciform structure, 337 ft. long and 190 ft. across the great transepts (exterior measurements). A relic of the Saxon foundation is preserved in the cross of St Osyth (c. 670), and a pre-Norman window is kept in the triforium, having been dug up near the cathedral. Of the work of the first two Norman abbots all that remains is the early Norman lower storey of the main transept. The foundations of Abbot Simeon’s apse were discovered below the present choir. The nave, which is Norman throughout, is 208 ft. in length, 72 ft. 9 in. to the top of the walls, and 77 ft. 3 in. broad, including the aisles. The upper parts of the western tower and the transept were begun by Bishop Geoffrey Ridel (d. 1180), and continued by his successor William Longchamp, chancellor of England. The tower, which is 215 ft. high, is surmounted by a Decorated octagon with partly detached side turrets, and underwent alteration and strengthening in the Perpendicular period. The north-western transept wing is in ruins; it is not known when it fell. The Galilee, or western porch, by which the cathedral is entered, is the work of Bishop Eustace (d. 1215), and is a perfect example of Early English style. In 1322 the Norman central tower, erected by Abbot Simeon, fell. Alan of Walsingham, sacrist of the church, designed its restoration in the form of the present octagon, a beautiful and unique conception. Instead of the ordinary four-arched central crossing, an octagon is formed at the crossing, the arches of the nave aisles and choir aisles being set obliquely. Both without and within, the octagon is the principal feature in the unusual general appearance of the cathedral, which gives it a peculiar eminence among English churches. The octagon was completed in 1328, and upon the ribbed vaulting of wood above it rose the lofty lantern, octagonal also, with its angles set opposite those of the octagon below. The total height of the structure is 170 ft. 7 in. Alan of Walsingham was further employed by Bishop John of Hotham (d. 1337) as architect of the Lady chapel, a beautiful example of Decorated work, which served from 1366 onward as a parish church. Of the seven bays of the choir the four easternmost, as well as the two beyond forming the retrochoir, were built by Bishop Hugh of Northwold (d. 1254). The three western bays were destroyed by the fall of the tower in 1321, and were rebuilt by Alan of Walsingham. The earlier portion is a superb example of Early English work, while the later is perhaps the best example of pure Decorated in England. The wooden canopies of the choir stalls are Decorated (1337) and very elaborate. The Perpendicular style is represented by windows and certain other details, including supporting arches to the western tower. There are also some splendid chantry chapels and tombs in this style—the chapels of Bishop John Alcock (d. 1500) and Bishop Nicolas West (d. 1534), in the north and south choir aisles respectively, are completely covered with the most delicate ornamentation; while the tomb of Bishop Sir Thomas Redman (d. 1523) consists of a beautiful canopy. Among earlier monuments the canopied tomb of Bishop William de Luda (1290-1298) and the finely-carved effigy of Bishop Northwold (1254) are notable. Between 1845 and 1884 the cathedral underwent restoration under the direction of Sir Gilbert Scott. The work included the erection of the modern reredos and choir-screen, both designed by Scott, and the painting of the nave roof by Styleman le Strange (d. 1862), who was succeeded by Gambier Parry. Parry also richly ornamented the octagon and lantern in the style of the 14th century.

Remains of the monastic buildings are fragmentary but numerous. Mention has been made of the Ely “Porta” or gateway (1306), which is occupied by the grammar school, and of Prior John de Cranden’s beautiful little Decorated chapel. But many of the remains, the bulk of which are incorporated in the deanery and canons’ and other residences to the south of the cathedral, are of much earlier date. Thus the fine early Norman arch of the prior’s hall is probably of the time of Abbot Simeon. Another notable fragment is the transitional Norman chancel of the infirmary chapel. The remnants of the cloisters show a reconstruction in the 15th century, but the prior’s and monks’ doorways from the cloisters into the cathedral are highly decorated late Norman. The bishop’s palace to the west of the cathedral has towers erected by Bishop Alcock at the close of the 15th century. In the muniment room of the chapter is preserved, among many ancient documents of great interest, the liber Eliensis, a history of the monastery by the monk known as Thomas of Ely (d. c. 1174), of which the first part, which extends to the year 960, contains a life of St Etheldreda, while the second is continued to the year 1107.

Ely, which according to Bede (Hist. eccl. iv. 19) derives its name from the quantity of eels in the waters about it (A.S. atel, eel-tig; island), was a borough by prescription at least as early as the reign of William the Conqueror. It owed its importance entirely to the monastery, and for a long time the abbots and afterwards the bishop had almost absolute power in the town. The bailiff who governed the town was chosen by the bishop until 1850, when a local board was appointed. Richard I.
ELYOT—ELYSIUM

granted the bishop of Ely a fair there, and in 1319-1320 John of Hotham, a later bishop, received licence to hold a fair on the
village of Ascension and for twenty days following. The
markets are claimed by an undated charter by the bishop, who
also continues to hold the fairs. In 1295 Ely sent two members
to parliament, but has never been represented since.

See C. W. Stubbs, Ely Cathedral (London, 1897); Victoria County
History, Cambridgeshire.

ELYOT, SIR THOMAS (c. 1490-1546), English diplomatist and
scholar. His father, Sir Richard Elyot (d. 1522), who held con-
siderable estates in Wiltshire, was made (1503) serjeant-at-law
and attorney-general to the queen consort, and soon afterwards
was commissioned to act as justice of assize on the western
circuit, becoming in 1513 judge of common pleas. Thomas was
the son of his first marriage with Alice Fynderne, but neither the
date nor place of his birth is accurately known. Anthony à
Wood claimed him as an alumnus of St Mary Hall, Oxford, while
C. H. Cooper in the Athenaæ Cantabrigienses put in a claim for
Jesus College, Cambridge. Elyot himself says in the preface to
his Dictionary that he was educated under the paternal roof,
and was from the age of twelve his own tutor. He supplies, in
the introduction to his Castell of Helth, a list of the authors he
had read in philosophy and medicine, adding that a "worshipful
physician" read to him Galen and some other authors. In 1511
he accompanied his father on the western circuit as clerk to the
assize, and he held this position until 1528. In addition to his
father's lands in Wiltshire and Oxfordshire he inherited in 1523
the Cambridge estates of his cousin, Thomas Fynderne. His
title was disputed, but Wolsey decided in his favour, and also
made him clerk of the privy council. Elyot, in a letter addressed
to Thomas Cromwell, says that he never received the emoluments
of this office, while the barren honour of knighthood conferred
on him when he was displaced in 1530 merely put him to further
expense. In that year he sat on the commission appointed to inquire
into the Cambridgeshire estates of his former patron, Cardinal
Wolsey. He married Margaret Barrow, who is described
(Stapleton, Vita Thomae Mori, p. 59, ed. 1558) as a student in the
"school" of Sir Thomas More.

In 1531 he produced the Book named the Governour, dedicated
to King Henry VIII. The work advanced him in the king's
favour, and in the close of the year he received instructions
to proceed to the court of the emperor Charles V. to induce him
to take a more favourable view of Henry's projected divorce from
Catherine of Aragon. With this was combined another
commission, on which one of the king's agents, Stephen Vaughan,
was already engaged. He was, if possible, to apprehend William
Tyndale. It is probable that Elyot was suspected, as Vaughan
certainly was, of lukewarmness in carrying out the king's wishes,
but this has not prevented his being much abused by Protestant
writers. As ambassador Elyot had been involved in ruinous
expense, and on his return he wrote to Thomas Cromwell,
begging to be excused from serving as sheriff of Cambridgeshire
and Huntingdonshire, on the plea of his poverty. The request
was granted. He was one of the commissioners in the inquiry
instigated by Cromwell prior to the suppression of the monasteries,
but he did not obtain any share of the spoils. There is little
doubt that his known friendship for Thomas More militated
against his chances of success, for in a letter addressed to Crom-
well he admitted his friendship for More, but protested that he
rated higher his duty to the king. William Roper, in his Life
of More, says that Elyot was on a second embassy to Charles V.,
in the winter of 1533-1536, when he received at Naples the news of
More's execution. He had been kept in the dark by his own
government, but heard the news from the emperor. The story
of an earlier embassy to Rome (1532), mentioned by Burnet,
rests on a late endorsement of instructions dated from that year,
which cannot be regarded as authoritative. In 1542 he repre-
sented the borough of Cambridge in parliament. He had pur-
chased from Cromwell the manor of Carleton in Cambridgeshire,
where he died on the 26th of March 1546.

Sir Thomas Elyot received little reward for his services to the
state, but his scholarship and his books were held in high esteem
by his contemporaries. The Boke named the Governour was
printed by Thomas Berthelet (1531, 1534, 1536, 1544, &c.).
It is a treatise on moral philosophy, intended to direct the
tuition of those destined to fill high positions, and to inculcate
those moral principles which alone could fit them for the perform-
ance of their duties. The subject was a favourite one in the
16th century, and the book, which contained many citations from
classical authors, was very popular. Elyot expressly
acknowledges his obligations to Erasmus's Institutio Principis
Christianii; but he makes no reference to the De regno et regis
institutione of Francesco Patrizi (d. 1494), bishop of Gaeta,
on which his work was undoubtedly modelled. As a prose
writer, Elyot enriched the English language with many new words.
In 1534 he published The Castell of Helth, a popular treatise on
medicine, intended to place a scientific knowledge of the art
within the reach of those unacquainted with Greek. This work,
though scotched at the faculty, was appreciated by the general
public, and speedily went through many editions. His Latin
Dictionary, the first comprehensive dictionary of the language,
was completed in 1538. The copy of the first edition in the
British Museum contains an autograph letter from Elyot to
Thomas Cromwell, to whom it originally belonged. It was
edited and enlarged in 1548 by Thomas Cooper, bishop of
Winchester, who called it Bibliotheca Eliotae, and it formed
the basis in 1565 of Cooper's Thesaurus linguae Romanae
et Britannicae.

Elyot's translations include:—The Doctrinal of Princes (1534),
from Isocrates; Cypriannus, A Sincere and Devote Sermon of Holy
Venture for the Preservation of the Pope (1534); Rules of a Christian
Life (1534), from Pico della Mirandola; The Education or Bringing
up of Children (c. 1535), from Plutarch; and Hoeve one may
take Prof of his Enymes (1535), from the same author is generally
attributed to him. He compiled the Knowledge which maketh a
Man a Man and a Friend of Science (1534), a collection of moral
sayings; Preservative against the Deth (1548), which contains many
quotations from the Fathers; Defence of Good Women (1545).
His Image of Governance, compiled of the doctrines and sentences
notable of the most famous Emperor Alexander Severus (1540)
promised to be a translation from a Greek MS. of the
emperor's secretary Eustochius (or Eculesius, as Elyot calls him),
which had been lent him by a gentleman of Naples, called Pudoricus,
the author of a book, which Elyot had found on his visit to Italy,
and had copied, and which was completed in 1548. It was
enlarged and published in 1550 by William Wotton for putting forward
translations of the works of Eustochius. Mr H. S. Croft
mentions his De rebus m. et f. gentibus Angliae; and Wotton quotes a few lines of a lost
translation of the Ars poética of Horace.

A learned edition of the Governour (2 vols., 1880), by H. S.
Croft, contains, besides copious notes, a valuable glossary of
16th century English words.

ELYRIA, a city and the county-seat of Lorain county, Ohio,
U.S.A., on the Black river, 8 m. from Lake Erie, and about
18 m. S.W. of Cleveland. Pop. (1890) 5671; (1900) 8797,
of whom 1397 were foreign-born; (1910) census, 13825. It
is served by the Baltimore & Ohio, and the Lake Shore & Michigan
Southern railways. Elyria is about 720 ft. above sea-level,
and lies at the junction of the two forks of the Black river,
each of which falls about 50 ft. here, furnishing water-power.
Among the city's manufactures are oxide of tin and other
chemicals, iron and steel, leather goods, automobiles and bicycles,
electrical and telephone supplies, butted tubing, gas engines,
screws and bolts, silk, lace and hosiery. In 1905 the city's
factory products were valued at $2,923,450—140.2% more
than their value in 1900. Flagging, building-stones and
grindstones, taken from quarries in the vicinity (known as
the Berea Grit quarries), are shipped from Elyria in large quantities.
Elyria was founded about 1819 by Herman Ely, in whose
honour it was named; it was selected as the site for the county
seat in 1835, and was chartered as a city in 1852.

ELYSIUM, in Greek mythology, the Elysian fields, the abode
of the righteous after their removal from earth. In Homer
(Od. iv. 563) this region is a plain at the farthest end of the
earth on the banks of the river Oceanus, where the fair-haired
ELZE—EMANATION

Rhadamithys rules, and where the people are vexed by neither snow nor storm, heat nor cold, the air being always tempered by the zephyr wafted from the ocean. It is no dwelling of the dead nor part of the lower world, but distinguished heroes are translated thither without dying, to live a life of perfect happiness. In Hesiod (W. and D. 166) the same description is given of the Islands of the Blessed under the rule of Cronus, which yield three harvests yearly. Here, according to Pindar, Rhadamithys sits by the side of his father Cronus and administers judgment (Ol. i. 61, Frag. 95). All who have successfully gone through in a triple probation on earth are admitted to share these blessings. In later accounts (Aeneid, vi. 541) Elisyum was regarded as part of the underworld, the home of the righteous dead adjudged worthy of it by the tribunal of Minos, Rhadamithys and Aeacus. Those who had lived evil lives were thrust down into Tartarus, where they suffered endless torments.

Elzevir, the name of a celebrated family of Dutch printers belonging to the 17th century. The original name of the family was Elsevier, or Elzevier, and their French editions mostly retain this name; but in their Latin editions, which are the more numerous, the name is spelt Elzevirus, which was gradually corrupted in English into Elzevir as a generic term for their books. The family originally came from Louvain, and there Louis, who first made the name Elzevir famous, was born in 1540. He learned the business of a bookbinder, and having been compelled in 1580, on account of his Protestantism and his adherence to the cause of the insurgent provinces, to leave his native country, he established himself as bookbinder and bookseller in Leiden. His Eutropius, which appeared in 1592, was long regarded as the earliest Elzevir, but the first is now known to be Drusi Eriocratum questionum ac responsionum libri duo, which was produced in 1583. In all he published about 150 works. He died on the 4th of February 1617. Of his five sons, Matthieu, Louis, Gilles, Joost and Bonaventure, who all adopted their father's profession, Bonaventure, who was born in 1583, is the most celebrated. He began business as a printer in 1608, and in 1626 took into partnership Abraham, a son of Matthieu, born at Leiden in 1592. Abraham died on the 14th of August 1652, and Bonaventure about a month afterwards. The fame of the Elzevirs extended to the Mar, and they were the exclusive printers of the works issued by this firm. Their Greek and Hebrew impressions are considered inferior to those of the Aldi and the Estiennes, but their small editions in 12mo, 16mo and 24mo, for elegance of design, neatness, clearness and regularity of type, and beauty of paper, cannot be surpassed. Especially may be mentioned the two editions of the New Testament in Greek (H koum diathek, Novum Testamentum, &c.), published in 1624 and 1633, of which the latter is the more beautiful and the more sought after, the Psalmcer Pontis, 1653; Virgilii opera, 1636; Terentii comedie, 1635; but the works which gave their press its chief celebrity are their collection of French authors on history and politics in 24mo, known under the name of the Petites Républiques, and their series of Latin, French and Italian classics in small 12mo. Jean, son of Abraham, born in 1622, had since 1647 been in partnership with his father and uncle, and when they died Daniel, son of Bonaventure, born in 1626, joined him. Their partnership did not last more than two years, and after its dissolution Jean carried on the business alone till his death in 1661. In 1654 Daniel joined his cousin Louis (the third of that name and son of the second Louis), who was born in 1604, and had established a printing press at Amsterdam in 1628. From 1655 to 1666 they published a series of Latin classics in 8vo, cum notis variis; Cicero in 4to; the Etymologian linguae Latinae; and a magnificent Corpus juris civilis in folio, 2 vols., 1663. Louis died in 1670, and Daniel in 1680. Besides Bonaventure, another son of Matthieu, Isaac, born in 1593, established a printing press at Leiden, where he carried on business from 1616 to 1625; but none of his editions attained much fame. The last representatives of the Elzevirs were Peter, grandson of Joost, who from 1667 to 1675 was a bookseller at Utrecht, and printed seven or eight volumes of little consequence; and Abraham, son of the first Abraham, who from 1681 to 1712 was university printer at Leiden.

Some of the Elzevirs editions bear no other typographical mark than the words Apud Elzeviers, or Ex officina Elzeviri, or in the rubrique of the town. But the majority bear one of their special devices, four of which are recognized as in common use. Louis Elzevir, the founder of the family, usually adopted the arms of the United Provinces, an eagle on a cippus holding in its claws a sheaf of seven arrows, with the motto Concordia res parvae crescant. About 1620 the Leiden Elzevirs adopted a new device, known as the "solitary," and consisting of an elm tree, a fruitful vine and a man alone, with a motto Non solus. They also used another device, a palm tree with the motto, Assurgo pressa. The Elzevirs of Amsterdam used for their principal device a figure of Minerva with owl, shield and olive tree, and the motto, Ne extra oleas. The earliest productions of the Elzevirs press are marked with an angel bearing a book and a scythe, and various other devices occur at different times. When the Elzevirs did not wish to put their name to their works they generally marked them with a sphere, but of course the mere fact that a work printed in the 17th century bears this mark is no proof that it is theirs. The total number of works of all kinds which came from the presses of the Elzevirs is given by Willems as 1668; there were also many forgeries.

See "Notice de la collection d'auteurs latins, français, et italiens, imprimés de format petit in 12, par les Elzeviers," in Brunet's Manuel du libraire (Paris, 1820); A. de Réunee, Recherches historiques, gégographiques, et bibliographiques sur l'origine des Imprimeries (Brussels, 1847); J. A. de la Vendee, Histoire de l'imprimerie, in two volumes (Paris, 1854); Pieters, Annales de l'imprimerie Elsevierienne (2nd ed., Ghent, 1858); Walther, Les Els écrivains de la bibliothèque impériale de St-Petersbourg (St Petersburg, 1864); Alphonse Willems, Les Elzevirs (Brussels, 1860), with a history of the Elzevirs family and their printing establishments, a chronological list and detailed description of all works printed by them, their various typographical marks, and a plate illustrating the types used by them; Keichler, Catalogue des livres imprimés Elsevieriens (Paris, 1860); Frick, Die Elsevischen Republiken (Halle, 1892); Berghman, Etudes sur la bibliographie Elsevierienne (Stockholm, 1885), and Nouvelles études, Éc. (ib. 1897).

EMANATION (Lat. emanatio, from e-, out, manare, to flow), in philosophy and theology, the name of one of the three chief theories of existence, i.e. of the relation between God and men—creation, preexistence, and emanation. This theory has been propounded in many forms, but the central idea is that the universe of individuals consists of the involuntary "outpourings" of the ultimate divine essence. That essence is not only all-inclusive, but absolutely perfect, while the "emanated" individuals degenerate in proportion to the degree of their distance from the essence. The existence of evil in opposition to the perfect goodness of God, as thus explained, need not be attributed to God's agency, inasmuch as the whole emanation-process is governed by necessity—as it were mechanical—laws, which may be compared to those of the physical universe. The doctrine of emanation is thus to be distinguished from the cosmogonic theory of Judaism and Christianity, which explains human existence as due to a single creative act of a moral agent. The God of Judaism and
Christianity is essentially a person in close personal relation to his creatures; emanation is the denial of personality both for God and for man. The emanation theory is to be contrasted, on the other hand, with the theory of evolution. The two theories are alike in so far as both recognize the existence of individuals as due to a necessary process of differentiation and a scale of existence. They differ, however, fundamentally in this respect, that, whereas evolution regards the process as from the indeterminate lower towards the determinate higher, emanation regards it as from the highest to the indefinitely lower.

There is considerable superficial similarity between evolution and emanation, especially in their formal statements. The process of evolution from the indeterminate to the determinate is often expressed as a progress from the universal to the particular. Thus the primordial matter assumed by the early Greek physicists may be said to be the universal substance out of which particular things arise. The doctrine of emanation also regards the world as a process of particularization. Yet the resemblance is more apparent than real. The universal is, as Herbert Spencer remarked, a subjective idea, and the general forms, existing ante rei. While it is so prominent a part in Greek and medieval philosophy as not in the least correspond to the homogeneous matter of the physical evolutionists. The one process is a logical operation, the other a physical. The theory of emanation, which had its source in certain moral and religious ideas, aims first of all at explaining the origin of mental or spiritual existence as an efflux from the divine and absolute spirit. In the next place, it seeks to account for the general laws of the world, for the universal forms of existence, as ideas which emanate from the Deity. By some it was developed into a complete philosophy of the world, in which matter itself is viewed as the lowest emanation from the absolute. In this form it stands in sharp antithesis to the doctrine of evolution, both because the former views the world of particular things and events as essentially unreal and illusory, and because the latter, so far as it goes, looks on matter as eternal, and seeks to explain the general forms of things as we perceive them by help of simpler assumptions. In certain theories known as doctrines of emanation, only mental existence is referred to the absolute source, while matter is viewed as eternal and distinct from the divine nature. In this form the doctrine of emanation approaches certain forms of the evolution theory (see EVOLUTION).

The doctrine of emanation is correctly described as of oriental origin. It appears in various forms in Indian philosophy, and is the characteristic oriental element in syncetic systems like Neoplatonism and Gnosticism. None the less it is easy to find it in embryo in the speculations of the essentially European philosophers of Greece. Plato, whose philosophy was strongly opposed to the evolution theory, distinctly inclines to the emanation idea in his doctrine that each particular thing is what it is in virtue of a pre-existent idea, and that the particulars are the lowest in the scale of existence, at the head of, or above, which is the idea of the good. The view of Xenocrates is based on the same ideas. Or again, we may compare the Stoic doctrine of ἀόρωνα (literally "emanations") from the divine essence. It is, however, only in the last eclectic period of Greek philosophy that this form of the doctrine was definitely established in the doctrines, e.g. Plotinus.

See especially articles EVOLUTION, NEOPLATONISM, GNOSTICISM.

MANUEL I. [Portuguese Manuel] (1460–1521), fourteenth king of Portugal, son of the Happy, knight of the Garter and of the Golden Fleece, was the son of Ferdinand of Vizeu and of Beatrice of Beja, grandchild of John I. of Portugal. He was born at Alcôchete on the 3rd of May 1469, or, according to Barbara Machado, on the 1st of June. His early education was directed by a Sicilian named Cataldo. In 1495 he became king in succession to his cousin John II. In 1497 he married Isabella, daughter of Ferdinand and Isabella of Castile, who had previously been married to Alphonso, the heir of John II. She died in the next year in giving birth to a son named Miguel, who until his death two years later was considered heir to the entire Iberian Peninsula. Emanuel’s next wife was Maria, another daughter of Ferdinand and Isabella, whom he married in 1500. Two of their children, John and Henry, later became kings of Portugal. Maria died in 1516, and in 1518 her niece Leonora, a sister of the emperor Charles V., became Emanuel’s third wife. Emanuel’s reign is noteworthy for the continuance of the Portuguese discoveries and the extension of their chain of trading-posts, Vasco da Gama’s opening an all-sea route to India, Cabral’s landing in Brazil, Corte-Real’s voyage to Labrador, the exploration of the Indian seas and the opening of commercial relations with Persia and China, bringing Portugal international prominence, colonial pre-eminence and a hitherto unparalleled degree of national prosperity. His intense religious zeal variously manifested itself in his persecutions of the Jews, whom at the beginning of his reign he had been disposed to tolerate, his strenuous endeavours to promote an international crusade against the Turks, his eager missionary enterprise throughout his new possessions, and his erection of twenty-six monasteries and two cathedrals, including the stately monastic church of the Jeronymos at Belem (see LISBON). His jealous and despotic character was accentuated by the enormous increase the Indies furnished to his personal wealth, and exemplified in his assumptions in the latter part of his reign.

He died at Lisbon on the 13th of December 1521.

The best authorities for the history of Emanuel’s reign are the contemporary 16th-century Chronica do Rei D. Manoel, by Damião de Goes, and De rebus Emmanuel, by J. Osoier. El Rei D. Manoel, by M. B. Branco (Lisbon, 1888), is a valuable but ill-arranged biography. See also the admirable work of D. Ribeiro Machado, Bibliographia Lusitana, vol. iii. pp. 161–166.

EMBALMING (Gr. ἐβαλίσματος, balsam; Ger. Einbalsamieren; Fr. embalsamement), the art of preparing dead bodies, chiefly by the use of medicaments, in order to preserve them from putrefaction and the attacks of insects. The ancient Egyptians carried the art to great perfection, and embalmed not only human beings, but cats, crocodiles, ichneumons, and other sacred animals. It was at one time suggested that the origin of embalming in Egypt was to be traced to a want of fuel for the purpose of cremation, to the inadvisability or at some times impossibility of burial in a soil annually disturbed by the inundation of the Nile, and to the necessity, for sanitary reasons, of preventing the decomposition of the bodies of the dead when placed in open sepulchres. As, however, the corpses of the embalmed must have constituted but a small proportion of the aggregate mass of animal matter daily to be disposed of, the above explanation would in any case be far from satisfactory; and there is no doubt (see MUMMY) that embalming originated in the idea of preserving the body for a future life. According to W. H. Prescott, it was a belief in a resurrection of the body that led the ancient Peruvians to preserve the air-dried corpses of their dead with so much solicitude (see Conquest of Peru, bk. i. chap. iii.). And J. C. Prichard (Egyptian Mythology, p. 200) properly compared the Egyptian practice with the views which rendered “the Greeks and Romans so anxious to perform the usual rites of sepulture to their departed warriors, namely, . . . that these solemnities expedited the journey of the soul to the appointed region, where it was to receive judgment for its former deeds, and to have its future doom fixed accordingly.” It has been supposed by some that the discovery of the embalming secret in saline soils may have been the immediate origin of embalming in Egypt. In that country certain classes of the community were specially appointed for the practice of the art. Joseph, we are told in Gen. 1. 2, “commanded his servants the physicians to embalm his father.”

Herodotus (ii. 80) gives an account of three of the methods of embalming followed by the Egyptians. The most expensive of these, which cost a talent of silver (£424: 158.), was as follows. The brains were in part removed through the nostrils by means of a bent iron implement, and in part by the injection of drugs. The intestines having been drawn out through an incision in the left side, the abdomen was cleansed with palm-wine, and filled with myrrh, cassia and other materials, and the opening was sewed up. This done, the body was steeped seventy days
in a solution of litron or natron.\(^1\) Diocles (i. 91) relates that the embalmer (μαγχανέας) appointed to make the incision in the flank for the removal of the intestines, as soon as he had performed his office, was pursued with stones and curses by those about him, it being held by the Egyptians a destestable thing to commit any violence or inflict a wound on the body. After the steeping, the body was washed, and handed over to the swatters, a peculiar class of the lowest order of priests, called by Plutarch cholektuyes, by whom it was bandaged in gummed cloth; it was then ready for the coffin. Mummies thus prepared were considered to represent Osiris. In another method of embalming, costing twenty-two minae (about 300), the abdomen was injected with "cedar-tree pitch" (κέδρις), which, as it would seem from Pliny (Nat. Hist. xvi. 21), was the liquid distillate of the pitch-pine. This is stated by Herodotus to have had a corrosive and solvent action on the viscera. After injection the body was steeped a certain number of days in natron; the contents of the abdomen was allowed to escape; and the process was then complete. The preparation of the bodies of the poorest consisted simply in placing them in natron for seventy days, after a previous rinsing of the abdomen with "symmaea." The material principally used in the costlier modes of embalming appears to have been asphalt; wax was more rarely employed. In some cases embalming seems to have been effected by immersing the body in a bath of molten bitumen. Tanning also was resorted to. Occasionally the viscera, after treatment, were in part or wholly replaced in the body, together with wax figures of the four genii of Amenti. More commonly they were embalmed in a mixture of sand and asphalt, and buried in vases, or canopi, placed near the mummy, the abdomen being filled with chips and sawdust of cedar and a small quantity of natron. In one jar were placed the stomach and large intestine; in another, the small intestines; in a third, the lungs and heart; in a fourth, the gall bladder and liver. Porphyry (De abstinentiis, iv. 10) mentions a custom of enclosing the intestines in a box and consigning them to the Nile, after a prayer uttered by one of the embalmers, but his statement is regarded by Sir J. G. Wilkinson as unworthy of belief. The body of Nero's wife Poppaea, contrary to the usage of the Romans, was not burnt, but as customary among other nations with the bodies of potentates, was honoured with embalming (see Tacitus, Ann. xvi. 6). The body of Alexander the Great is said to have been embalmed with honey (Statius, Silv. iii. 2. 117), and the same material was used to preserve the corpse of Agesipolis I. during its conveyance to Sparta for burial. Herodotus states (iii. 24) that the Ethiopians, in embalming, dried the body with gypsum (or chalk), and, having painted it, placed it in a block of some transparent substance. The Guanches, the aborigines of the Canaries, employed a mode of embalming similar to that of the Egyptians, filling the hollow caused by the removal of the viscera with salt and an absorbent vegetable powder (see Bory de Saint Vincent, Essais sur les îles Fortunes, 1803, p. 495). Embalming was still in vogue among the Egyptians in the time of St Augustine, who says that they termed mummies gabbarae (Serm. 120, cap. 12).

In modern times numerous methods of embalming have been practised. Dr Frederick Ruysch of Amsterdam (1665-1717) is said to have utilized alcohol for this purpose. By William Hunter essential oils, alcohol, cinnabar, camphor, saltpetre and pitch or resin were employed, and the final desiccation of the body was effected by means of roasted gypsum placed in its coffin. J. P. Boudet (1778-1849) embalmed with tan, salt, asphalt and Peruvian bark, camphor, cinnamon and other aromatics and corrosive sublimate. The last-mentioned drug, chloride and sulphate of zinc, acetate and sulphate of alumina, and crocante and carbolic acid have all been recommended by various modern embalmers.

Bat., 1695); Thomas Greenhill, The Art of Embalming (London, 1705); J. N. Marzolin, Manuel d'anatomie (Paris, 1810); Pettigrew, History of Mummies (London, 1834); Gannal, Traité d'embalmements (Paris, 1838; 2nd ed., 1841); Magnus, Das Einbalzens der Leichen (Brunsw., 1839); Sarracini, Embalming (Paris, 1834); Rawlinson, Textbook of Embalming (Springfield, Ohio, 1900); Rawlinson, Herodotus, vol. ii. p. 141: G. Elliot Smith, A Contribution to the Study of Mummification in Egypt (Cairo, 1906).

EMBANKMENT, in engineering, a mound of earth or stone, usually narrow in comparison with its length, artificially raised above the prevailing level of the ground. Embankments serve for two main classes of purpose. On the one hand, they are used to preserve the level of railways, canals and roads, in cases where a valley or piece of low-lying ground has to be crossed. On the other, they are employed to stop or regulate the flow of water, either constituting the retaining walls of reservoirs constructed in connexion with water-supply schemes, or protecting low-lying tracts of land from river floods or the encroachments of the sea. The word embankment is thus come to be used for the mass of material, faced and supported by a stone wall and protected by a parapet, placed along the banks of a river where it passes through a city, whether to guard against floods or to gain additional space. Such is the Thames Embankment in London, which carries a broad roadway, while under it runs the Underground railway. In this sense an embankment is distinguished from a quay, though the mechanical construction may be the same, the latter word being confined to places where ships are loaded and unloaded, thus differing from the French quai, which is used both of embankments and quays, e.g. the Quais along the Seine at Paris.

EMBARGO (a Spanish word meaning "stoppage"), in international law, the detention by a state of vessels within its ports as a measure of public, as distinguished from private, utility. In practice it serves as a mode of coercing a weaker state. In the middle ages war, being regarded as a complete rupture between belligerent states, operated as a suspension of all respect for the person and property of private citizens; an article of Magna Carta (1215) provided that "... if there shall be found any such merchants in our land in the beginning of a war, they shall be attached, without damage to their bodies or goods, until it may be known unto us, or our Chief Justiciary, how our merchants are treated who happen to be in the country which is at war with us; and if ours be safe there, theirs shall be safe in our lands" (art. 48).

Embargoes in anticipation of war have long since fallen into disuse, and it is now customary on the outbreak of war for the belligerents even to grant a respite to the enemy's trading vessels to leave their ports at the outbreak of war, so that neither ship nor cargo is any longer exposed to embargo. This has been confirmed in one of the Hague Conventions of 1907 (convention relative to the status of enemy merchant ships at the outbreak of hostilities, Oct. 18, 1907), which provides that "when a merchant ship belonging to one of the belligerent powers is at the commencement of hostilities in an enemy port, it is desirable to that it should be allowed to depart freely, either immediately, or after a reasonable number of days of grace, and to proceed, after being furnished with a pass, direct to its port of destination, or any other port indicated" (art. 1). The next article of the same convention limits the option apparently granted by the use of the word "desirable," providing that "a merchant ship unable, owing to circumstances of force majeure, to leave the enemy port within the period contemplated (in the previous article), or which was not allowed to leave, cannot be confiscated. The belligerent may only detain it, without compensation, but subject to the obligation of restoring it after the war, or requisitioning its employment for compensation" (art. 2).

EMBASSY, the official of an ambassador, or, more generally, the mission on which an ambassador of one power is sent to another, or the body of official personages attached to such a mission, whether temporary or permanent. Hence "embassy" is often quite loosely used of any mission, diplomatic or otherwise. The word is also used of the official residence of an ambassador. "Embassy" was originally "ambassad," the form

\(^1\) Neutral carbonate of sodium, Na\(_2\)CO\(_3\), found at the natin lakes in the Libyan desert, and at El Hogs, in Upper Egypt.
found in the 17th century, but by the time of Johnson considered quite obsolete. "Ambassy" is from the O. Fr. ambasse, derived through such forms as the Port. ambassada, Ital. ambasciata from a lost Med. Lat. ambasciata, ambassiacire, to go on a mission. (See further Ambassador, Exterritoriality and Diplomacy.)

EMBER DAYS and EMBER WEEKS, the four seasons set apart by the Western Church for special prayer and fasting, and the ordination of clergy, known in the medieval Church as quatuor tempora, or jejunia quatuor temporum. The Ember weeks are the complete weeks next following Holy Cross day (September 14), St. Lucy’s day (December 13), the first Sunday in Lent and Whitsun day. The Wednesdays, Fridays and Saturdays of these weeks are the Ember days distinctively, the following Sundays being the days of ordination. These dates are given in the following memorial distich with a frank indifference to quantity and metre—

"Venit Croc. Lucia, Cinia, Charismata dia.
Quod det vota qua sequens feria."

The word has been derived from the A.S. ymb-ren, a circuit or revolution (from ymb, around, and rennen, to run); or by process of agglutination and phonetic decay, exemplified by the Ger. quattember, Dutch quartemper and Dan. kvatember, from the Lat. quatuor tempora.

The occurrence of the Anglo-Saxon compounds ymbren-tid, ymbren-wacan, ymbren-festan, ymbren-dagas for Ember tide, weeks, fasts, days, favours the former derivation, which is also confirmed by the use of the word imbrum in the acts of the council of Nenham, A.D. 1009 ("jejunia quattuor tempora qua imbrum vacant"). It corresponds also with Pope Leo the Great’s definition, "jejunia ecclesiae per totius anni circulum distributa."

The observance of the Ember days is confined to the Western Church, and had its origin as an ecclesiastical ordinance in Rome. They were probably at first merely the fasts preparatory to the three great festivals of Christmas, Easter, and Whitsun. Ember Tuesday, the fourth was subsequently added, for the sake of symmetry, to make them correspond with the four seasons, and they became known as the jejenum vernum, aestivum, autumnale and hiemale, so that, to quote Pope Leo’s words, "the law of abstinence might apply to every season of the year." An earlier mention of these fasts, as four in number—the first known—is in the writings of Philastrius, bishop of Brescia, in the middle of the 4th century. He also connects them with the great Christian festivals (De haeres. 110). In Leo’s time, A.D. 440-461, Wednesday, Friday and Saturday were already the days of special observance. From Rome the Ember days gradually spread throughout the whole of Western Christendom. Uniformity of practice, however, was of somewhat slow growth. Neither in Gaul nor Spain do they seem to have been generally recognized much before the 8th century. Their introduction into Britain appears to have been earlier, dating from Augustine, A.D. 597, acting under the authority of Gregory the Great. The general period of the four fasts being roughly fixed, the precise date appears to have varied considerably, and in some cases to have lost its connexion with the festivals altogether. The Ordo Romanus fixes the spring fast in the first week of March (then the first month); the summer fast in the second week of June; the autumnal fast in the third week of September; and the winter fast in the complete week next before Christmas eve. Other regulations prevailed in different countries, until the inconveniences arising from the want of uniformity led to the rule now observed being laid down under Pope Urban II. as the law of the church, in the councils of Clermont and Clermont, A.D. 1095.

The present rule which fixes the ordination of clergy in the Ember weeks cannot be traced further back than the time of Pope Gelasius, A.D. 492-506. In the early ages of the church ordinances took place at any season of the year whenever necessity required. Gelasius is stated by certain writers to have been the first who limited them to these particular times, the special solemnity of the season being in all probability the cause of the selection. The rule once introduced commended itself to the mind of the church, and its observance spread. We find it laid down in the pontificate of Archbishop Egbert of York, A.D. 735-766, and referred to as a canonical rule in a capitulary of Charlemagne, and it was finally established as a law of the church in the pontificate of Gregory VII, c. 1085.

EMBEZZLEMENT (A.-Fr. embeulement, from bezeler or besellier, to destroy), in English law, a peculiar form of theft, which is distinguished from the ordinary crime in two points:—(1) It is committed by a person who is in the position of clerk or servant to the owner of the property stolen; and (2) the property when stolen is in the possession of such clerk or servant. The definition of embezzlement as a special form of theft arose out of the difficulties caused by the legal doctrine that to constitute larceny the property must be taken out of the possession of the owner. Servants and others were thus able to steal with impunity goods entrusted to them by their masters. A statute of Henry VIII. (1539) was passed to meet this case; and it enacted that it should be felony in servanthood to embezzle goods, and that they might be recovered, and the goods restored, as by a legal right, and if not found, the servant might be sued, as by a debt, and the amount of the goods be recovered in damages. "This act," says Sir J. F. Stephen (General View of the Criminal Law of England), "assisted by certain subtleties according to which the possession of the servant was taken under particular circumstances to be the possession of the master, so that the servant by converting the goods to his own use took them out of his own possession quia servant (which was his master’s possession) and put them into his own possession quia thief (which was a felony), was considered sufficient for practical purposes for more than 200 years." In 1799 a clerk who had converted to his own use a cheque paid across the counter to him by a customer of his master was held to be not guilty of felony; and in the same year an act was passed, which, meeting the difficulty in such cases, enacted that if any clerk or servant employed as clerk or servant, should, by virtue of such employment, receive or take into his possession any money, bonds, bills, &c., for or in the name of or on account of his employers, and should fraudulently embezzle the same, every such offender should be deemed to have stolen the same. The same definition is substantially repeated in a Consolidation Act passed in 1827. Numberless difficulties of interpretation arose under these acts, e.g. as to the meaning of "clerk or servant," as to the difference between theft and embezzlement, &c.

The law now in force, or the Larceny Act 1861, defines the offence thus (section 68):—"Whosoever, being a clerk or servant, or being employed for the purpose or in the capacity of a clerk or servant, shall fraudulently embezzle any chattel, money or valuable security which shall be delivered to or received or taken into possession by him for or in the name or on the account of his master or employer, or any part thereof, shall be deemed to have feloniously embezzled the same from his master or employer, although such chattel, money or security was not received into the possession of such master or employer otherwise than by the actual possession of his clerk, servant or other person so employed, and being convicted thereof shall be liable, at the discretion of the court, to be kept in penal servitude for any time not exceeding fourteen years, and not less than three years," (or imprisonment with or without hard labour for not more than two years. To constitute the offence thus described three things must concur:—(1) The offender must be a clerk or servant; (2) he must receive into his possession some chattel or money of his master or employer; and (3) he must fraudulently embezzle the same. A clerk or servant has been defined to be a person bound either by an express contract of service or by conduct implying such a contract to obey the orders and submit to the control of his master in the transaction of the business which it is his duty as such clerk or servant to transact. (Stephens’ Digest of the Criminal Law, Art. 300.)

The Larceny Act 1901, amending sections 75 and 76 of the Larceny Act 1861, also describes similar offences on the part of
persons, not being clerks or servants, to which the name embezzlement is not uncommonly applied. The act makes the offence of fraudulently misappropriating property entrusted to a person by another, or received by him on behalf of another a misdemeanour punishable by penal servitude for a term not exceeding seven years, or to imprisonment, with or without hard labour, for a term not exceeding two years. So also trustees fraudulently disposing of trust property, and directors of companies fraudulently appropriating the company's property or keeping fraudulent accounts, or wilfully destroying books or publishing fraudulent statements, are misdemeanans punishable in the same way.

In the United States the law of embezzlement is founded mainly on the English statute passed in 1796, but the statutes of most states are so framed that larceny includes embezzlement. The latter is sometimes denominated statutory larceny. The punishment varies in the different states, otherwise there is little substantial difference in the laws of the two countries. Statutes have been passed in some states providing that one indicted for larceny may be convicted of embezzlement. But it is doubtful whether such statutes are valid where the constitution of the state provides that the accused must be informed of the nature and cause of the accusation against him. (See also Larceny.)

**Emblem** (Gr. ἔμβλημα, something put in or inserted, from ἐμβάλλων, to throw in), a word originally applied in Greek and Latin (emblema) to a raised or inlaid ornament on vases and other vessels, &c., and also to mosaic or tessellated work. It is in English confined to a symbolical representation of some object, particularly when used as a badge or heraldic device.

**Emblements** (from O. Fr. emblemation de blé, i.e. corn sprung up above ground), a term applied in English law to the corn and other crops of the earth which are produced annually, not spontaneously, but by labour and industry. Emblements being therefore to the class of fructus industriales, or "industrial growing crops" (Sale of Goods Act 1893, § 62). They include not only corn and grain of all kinds, but everything of an artificial and annual profit that is produced by labour and manuring, e.g. hemp, flax, hops, potatoes, artificial grasses like clover, but not fruit growing on trees, which come under the general rule quicquid plantatur solo, solo cedit. Emblems are included within the definition of goods in s. 62 of the Sale of Goods Act 1893. Where an estate of uncertain duration terminates unexpectedly by the death of the tenant, or some other event due to no fault of his own, the law gives to the personal representative the profits of crops of this nature as compensation for the tilling, manuring and sowing of the land. If the estate, although of uncertain duration, is determined by the tenant's own act, the right to emblements does not arise. The right to emblements has become of no importance in England since 1857, when it was provided by the Landlord and Tenant Act 1851 (s. 1) that any tenant at rack-rent, whose lease was determined by the death orcesser of the estate, of a landlord entitled only for his life, or for any other uncertain interest, shall, instead of emblements, be entitled to hold the lands until the expiration of the current year of his tenancy. The right to emblements still exists, however, in favour of (a) a tenant not within the Landlord and Tenant Act 1851, whose estate determines by an event which could not be foreseen, (b) the executor, as against the heir of the owner in fee of land in his own occupation, (c) an execution creditor under a writ directing seizure of goods and chattels. A person entitled to emblements may enter upon the lands after the determination of the tenancy for the purpose of cutting and carrying away the crops. Emblements are liable to distress by the landlord for years of rent, or rent during the period of holdover under the act of 1851 (the Distress for Rent Act 1837; see Bullen on Distress, 4th ed., 1863).

The term "emblements" is unknown in Scots law, but the heir or representative of a life-rent tenant, a liferenter of lands, has an analogous right to reap the crop (on paying a proportion of the rent) and a right to recompense for labour in tilling the ground. The Landlord and Tenant Act 1851 (s. 1) was in force in Ireland till 1860, when it was replaced by the Land Act 1860, which gave to the tenant an almost identical right to emblements (s. 34).

In the United States the English common law of emblements has been generally preserved. In North Carolina there has been legislation on the lines of the English Landlord and Tenant Act 1851. In some states the tenant is entitled to compensation also from the person succeeding to the possession.

Under the French Code Civil, the outgoing tenant is entitled to convenient housing for the consumption of his fodder and for the maintenance of his stock. This right is determined (art. 1777). The same rule is in force in Belgium (Code Civil, art. 1777); and in Holland (Civil Code, art. 1635) and Spain (art. 1578). Similar rights are secured to the tenant under the German Civil Code (arts. 592 et seq.). French law is therefore in line with the legislation of a number of countries, the Landlord and Tenant Act 1851 (14 & 15 Vict., c. 25, s. 1) are in force in many of the British colonies acquired by settlement. In other colonies they have been recognized by statute (e.g. Victoria, Landlord and Tenant Act 1890, No. 1108, ss. 45-48; Tasmania, Landlord and Tenant Act 1874, 38 Vict. No. 12).

(A. W. R.)

**Embossing**, the art of producing raised portions or patterns on the surface of metal, leather, textile fabrics, cardboard, paper and similar substances. Strictly speaking, the term is applicable only to raised impressions produced by means of engraved dies or plates brought forcibly to bear on the material to be embossed, by various means, according to the nature of the material acted on. Thus raised patterns produced by cutting, chiselling, casting and chasing or hammering are excluded from the range of the work. It is generally the use of engraved or moulded dies on an expeditious medium for producing elegant ornamental effects in many distinct industries; and especially in its relations to paper and cardboard its applications are varied and important. Crests, monograms, addresses, &c., are embossed on paper and envelopes from dies set in small hand screw presses, a force or counter die being prepared in leather faced with a coating of gutta-percha. The dies to be used for plain embossing are generally cut deeper than those intended to be used with colours. Colour embossing is done in two ways—the first and ordinary kind that in which the ink is applied to the raised portion of the design. The colour in this case is spread on the die with a brush and the whole surface is carefully cleaned, leaving only ink in the depressed parts of the engraving. In the second variety—called cameo embossing—the colour is applied to the flat parts of the design by means of a small printing roller, and the letters or design in relief is left uncoloured. In embossing large ornamental designs, engraved plates or electrotypes therefrom are employed, the force or counterpart being composed of mill-boards faced with gutta-percha. In working these, powerful screw-presses, in principle like coinage or medal-striking presses, are employed. Embossing is also most extensively practised for ornamental purposes in the art of bookbinding. The blocked ornaments on cloth covers for books, and the blocking or imitation tooling on the cheaper kinds of leather work, are effected by means of powerful embossing or arming presses. (See Book-Binding.)

For impressing embossed patterns on wall-papers, textiles of various kinds, and felt, cylinders of copper, engraved with the patterns to be raised, are employed, and these are mounted in calender frames, in which they press against rollers having a yielding surface, so constructed that the engraved cylinders fit into corresponding elevations in those against which they press. The operations of embossing and colour printing are also sometimes effected together in a modification of the ordinary cylinder printing machine used in calico-printing, in which it is only necessary to introduce suitably engraved cylinders.

For many purposes the embossing rollers must be maintained at a high temperature while in operation; and they are heated either by steam, by gas jets, or by the

introduction of red-hot irons within them. The stamped or struck ornaments in sheet metal, used especially in connexion with the brass and Britannia-metal trades, are obtained by a process of embossing—hard steel dies with forces or counterparts of soft metal being used in their production. A kind of embossed ornament is formed on the surface of soft wood by first compressing and subsequently sinking the parts intended to be embossed, then planing the whole surface level, after which, when the wood is placed in water, the previously depressed portion swells up and rises to its original level. Thus an embossed pattern is produced which may be subsequently sharpened and finished by the ordinary process of carving (see CHASING and REPOUSSÉ).  

EMBRACERY (from the O. Fr. embraseur, an embracer, i.e. one who excites or instigates, literally one who sets on fire, from embraser, to kindle a fire; "embrace," i.e. to hold or clasp in the arms, is from O. Fr. embracer, Lat. in and brachia, arms), in law, the attempting to influence a jurman corruptly to give his verdict in favour of one side or the other in a trial, by promise, persuasions, entertainments, money, entertainments and the like. It is an offence both at common law and by statute, and punishable by fine and imprisonment. As a statutory offence it dates back to 1360. The offence is complete, whether any verdict has been given or not, and whether the verdict is in accordance with the weight of evidence or otherwise. The person making the attempt, and any jurman who consents, are equally punishable. The false verdict of a jury, whether occasioned by embracery or otherwise, was formerly considered criminal, and jurors were severely punished, being proceeded against by writ of attain (q.v.). The Juries Act of 1825, in abolishing writs of attain, made a special exemption as regards jurors guilty of embracery (§ 6). Prosecution for the offence has been so extremely rare that when a case occurred in 1891 (R. v. Baker, 113, Cent. Crim. Ct. Sess. Pap. 374) it was stated that no precedent could be found for the indictment. The defendant was fined £200, afterwards reduced to £100.  

EMBRASURE, in architecture, the opening in a battlement between the two raised solid ports or merlons, sometimes called a crenelle (see BATTLEMENT, CRENELLE); also the spay of a window.  

EMBROIDERY (Med. broderie, from O. Fr. broder, Mod. Fr. broder), the ornamentation of textile fabrics and other materials with needlework. The beginnings of the art of embroidery probably date back to a very primitive stage in the history of all peoples, since plain stitching must have been one of the earliest attainments of mankind, and from that it is but a short step to decorative needlework of some kind. The discovery of needles among the relics of Swiss lake-dwellings shows that their primitive inhabitants were at least acquainted with the art of stitching.  

In concerning ourselves solely with those periods of which examples survive, we must pass over a wide gap and begin with the anciently civilized land of Egypt. The sandy soil and dry climate of that country have led to the preservation of woven stuffs and embroideries of unique historic interest. The principal, and by far the earliest, known pieces which have a bearing on the present subject, found in 1903 in the tomb of Tuthmosis (Thoutmosis, or Thothmes) IV. at Thebes, are now in the Cairo Museum. There are three fragments, entirely of linen, inwrought with patterns in blue, red, green and black (fig. 1). A kind of tapestry method is used, the patterns being wrought upon the warp threads of the ground, instead of upon the finished web or woven material. Such a process, generally supplemented, as in this case, by a few stitches of fine needlework, was still in common use at a far later time. The largest of the three fragments at Cairo bears, in addition to rows of lotus flowers and papyrus inflorferences, a cartouche containing the name of Amenophis (Amenhotep) II. (c. 15th century B.C.).  

![Fig. 1.—Fragment of a linen robe, found in the tomb of Tuthmosis (Thothmes) IV. at Thebes, and now in the Cairo Museum. The cartouche has the name of Amenophis (Amenhotep) II. (c. 15th century B.C.).](image-url)  

No other embroidered stuffs which can be assigned to so early a date have hitherto come to light in the Nile valley (nor indeed elsewhere), and the student who wishes to gain a fuller knowledge of the textile patterns of the ancient Egyptians must be referred to the wall-paintings and sculpturedreliefs which have been preserved in considerable numbers.  

From the ancient civilizations of Babylon and Assyria no fragments of embroidery, nor even of woven stuffs, have come down to us. The fine series of wall-reliefs from Nineveh in the British Museum give some idea of the geometrical and floral patterns and diapers which adorned the robes of the ancient Assyrians. The discovery of the ruins of the palace of Darius I. (521-485 B.C.) at Susa in 1885 has thrown some light upon the textile art of the ancient Persians. They evidently owed much to the nations whom they had supplanted. The famous relief from this palace (now in the Louvre) represents a procession of archers, wearing long robes covered with small diaper patterns, perhaps of embroidery.  

The exact significance of the words used in the book of Exodus in describing the robes of Aaron (ch. xxviii.) and the hangings and ornaments of the Tabernacle (ch. xxvii.) cannot be determined, and the "broidered work" of the prophecy of Ezekiel (ch. xxvii.) at a later time is also of uncertain meaning. It seems likely that much of this ancient work was of the tapestry class, such as we have found in the early fragments from Thebes.  

The methods of the ancient Greek embroiderers, or "variegator" (μαρσας) to whom woven garments were submitted  

1 See H. Carter and P. E. Newberry, Cat. gén. des ant. égypt. du musée du Caire (1904), pl. i. and xxvii. A remarkable piece of Egyptian needlework, the funerary tent of Queen Isisemkheb (XXIst Dynasty), was discovered at Deir el Bahri some years ago. It is described as a mosaic of leatherwork—pieces of gazelle hide of several colours, stitched together (see Villiers Stuart, The Funeral Tent of an Egyptian Queen, 1882).
for enrichment, can only be conjectured. The peplos or woven cloth made every fifth year to cover or shade the statue of Athena in the Parthenon at Athens, and carried at the Panathenian festival, was ornamented with the battles of the gods and giants. The late Dr J. H. Middleton thought that very possibly most of the elaborate work upon these peploi was done by the needle. That true embroidery, in the modern sense—the decoration by means of the needle of a finished woven material—was practised among the ancient Greeks, has been demonstrated by the finding of some textile fragments in graves in the Crimea; these are now in the Hermitage at St Petersburg. One of them, of purple woollen material, from a tomb assigned to the 4th century B.C., is embroidered in wool of different colours with a man on horseback, honeysuckle ornament and tendrils. Another woollen piece, attributed to the following century, has a stem and arrow-head leaves worked in gold thread.

In turning to ancient Rome, it is well first briefly to notice Pliny's account of the craft (Nat. Hist. viii.), as recording the views current in Rome at his time (1st century A.D.). After relating that Homer mentions embroidered garments (pictis seto), he states that the Phrygians first used the needle for the production of robes, which were thence called Phrygian (Phrygovias), and that Attalic garments were named from Attalus II., king of Pergamum (159-138 B.C.), the inventor of the art of embroidering in gold. He further relates that Babylon gave the name to embroiderers of divers colours, for the production of which that city was famous. By the Romans the art was designated as 'painting with the needle' (acu pingere), a term used by Virgil in speaking of the decoration of robes, by Ovid (who describes it as an art taught by Minerva), and by Roman writers generally when referring to embroidery. It is to be regretted that no examples have been discovered in the neighbourhood of the Roman capital. For embroiderers made under Roman influence we must again look to Egypt. They formed the decoration of garments and mummy-wrappings from the cemeteries in Upper and Middle Egypt, which have been so extensively rilled of late years. Those of Roman type date approximately from the first five centuries of the Christian era. The earliest represent human figures, animals, birds, geometrical and interlacing ornaments, vases, fruit, flowers and foliage (especially the vine). They are generally done in purple wool and undyed linen thread by the tapestry process employed in Egypt at least fifteen centuries earlier, as we have seen; most of the patterns have had the lines more clearly marked out by the ordinary method of needlework. Towards the end of this period a greater choice of colours is seen, and Christian symbols appear. At this time examples worked entirely upon the finished web are found (fig. 2). The transition is easy from such work to the veritable 'needle-paintings,' representing scenes from the gospels, produced in Egypt shortly after (fig. 3). Such embroiderers are evidently akin to those mentioned by Bishop Asterius (330-440), who describes the garments worn by emmancenes as painted like the walls of their houses.

From the time of Justinian (527-565) onwards for some centuries, the art of Europe, embroidery with the rest, was dominated by that of the Byzantine empire. To trace the progress of the highly conventionalized Byzantine style, becoming more rigid and stereotyped as time passed, belongs to the general history of art, and such a task cannot be attempted here. Perhaps the most remarkable example of all which have survived

1 The procession at this festival is represented upon the frieze of the Parthenon.

3 For an account of the conditions under which Greek and Roman embroiderers worked, see Alan S. Cole, 'Some Aspects of Ancient and Mediaeval Embroidery,' Journal of the Society of Arts, vol. iii., 1905, pp. 958, 959.
4 Chiefly tunicis with vertical bands (clavi) and medallions (orbicula), and an ample outer robe or cloak.
5 The Adoration of the Magi is represented upon the lower border of the long robe worn by the emperor Theodos (wife of Justinian) in the mosaic in the church of S. Vitale at Ravenna.

---

FIG. 2.—Embroidered panel from a linen garment, with a jewelled cross and two birds within a wreath. Found in a cemetery at Akhmim, Upper Egypt. Epypto-Roman work of the 4th or 5th century A.D.

To illustrate the work of the Byzantine embroiderers is the blue silk robe known as the dalmatic of Charlemagne or of Leo III., in the sacristty of St Peter's at Rome (fig. 4). According to the present consensus of opinion it belongs to a later time than either of these dignitaries, dating most probably from the 12th century. In front is represented Christ enthroned as Judge of the world, a youthful but majestic figure; on the back is the Transfiguration. These, as well as the minor subjects, are explained by Greek inscriptions. The wide influence of Byzantine art gradually died out after the Latin sack of Constantinople in the year 1204, although the style lingered, and lingers still, in certain localities, notably at Mount Athos.

Palermo in Sicily succeeded Byzantium as the capital of the

6 Writers have assigned different dates to this vestment: Lady Alford, Needlework as Art (earlier than the 13th century); F. Bock, Die Kleidung der Byzantinischen Kaiser, über die Kaiser-Dalmatic in der St Peterskirche zu Rom (12th or first half of 13th century); A. S. Cole, Cantor Lectures at Society of Arts, 1905 (possibly of 9th century); Lord Lindsay, Christian Art (19th or early 13th century); A. Venturi, Storia dell'arte (10th or 11th century); T. Braun, Liturg. Gewandung, p. 305 and note (late 14th or early 15th century).
In the later part of the following century the "Bayeux Tapestry" was produced—a work of unique importance (Plate I. fig. 7). It is a band of linen, more than 230 ft. long, embroidered in coloured wools with the story of the Norman conquest of England. (See BAYEUX TAPESTRY.)

Some fragments of metallic embroidery on silk, of the 12th and 13th centuries, may be seen in the library of Worcester cathedral. They were removed from the coffins of two bishops, William de Blois (1218-1236) and Walter de Cantelupe (1236-1266). A fragment of gold embroidery from the tomb of the latter bishop is preserved in the Victoria and Albert Museum at South Kensington, and others are in the British Museum. In the 13th century English embroidery was famous throughout western Europe, and many embroidered objects are described in inventories of that time as being de opere anglicano. During that century, and the early part of the next, English work was at its best. The most famous example is the "Syon cope" at South Kensington, belonging to the latter half of the 13th century (see COPE, Plate I. fig. 2). It represents the coronation of the Virgin, the Crucifixion, the archangel Michael transfixing the dragon, the death and burial of the Virgin, our Lord meeting Mary Magdalen in the garden, the Apostles and the hierarchies of angels. The broad orphrey is embroidered with a series of heraldic shields (Plate II. fig. 9). Other embroideries of the period are at Steeple Aston, Chesterfield (Col. Butler-Bowden), Victoria and Albert and British museums, Rome (St John Lateran), Bologna, Pienza, Anagni, Ascoli, St Bertrand de Comminges, Lyons museum, Madrid (archaeological museum), Toledo and Vich.

During the course of the 14th and 15th centuries embroideries produced in England were not equal to the earlier work. Towards the end of the latter century, and until the dissolution of the monasteries in the next, much ecclesiastical embroidery of effective design was done, and many examples are still to be seen in churches throughout the country. In the Tudor period the costumes of the wealthy were often richly adorned with needlework. The portraits of King Henry VIII., Queen Elizabeth and their courtiers show how magnificent was the embroidery used for such purposes. Many examples, especially of the latter reign, worked with very effective and beautiful floral patterns, have come down to the present time. A kind of embroidery known as "black work," done in black silk on linen, was popular during the same reign. A tunic embroidered for Queen Elizabeth, with devices copied from contemporary woodcuts, is an excellent example of this work. It now belongs to the Viscount Falkland. Another class of work, popular at the same time, was closely worked in wools and silks on open-mesh material like canvas, which was entirely covered by the embroidery. Figures in rich costume were often introduced (Plate I. fig. 6). This method was much practised in France, and the term applied to it in that country, "au petit point," has become generally used. Throughout the 17th and 18th centuries embroidery in England, though sometimes lacking in good taste, maintained generally a high standard, and that done to-day, based on the study of old examples, need not fear comparison with any modern work. During these three centuries bold floral patterns for hangings, curtains and coverlets have been usual (Plate III. fig. 13), but smaller works, such as samplers, covers of work-boxes, and perhaps landscape subjects (fig. 5), have been produced in large numbers. In the 18th century gentlemen's coats and waistcoats and ladies' dresses were extensively embroidered.

In France, embroidery, like all the arts practised by that nation, has been characterized by much grace and beauty, and many good specimens belonging to different periods are known. The vestments associated with the name of St Thomas of Canterbury at Sens may be either of French or English work (12th century). To the later part of the following century belongs a band of embroidery, representing the coronation of the Virgin, the Adoration of the Magi, the presentation in the Temple, and other subjects beneath Gothic arches, preserved in the Hôtel-Dieu at Château Thierry. The mitre of Jean de Marigny, archbishop of Rouen (1347-1357), in the museum at Évreux,

**Fig. 4.—Embroidered robe known as the "Dalmatic of Charlemagne," or of Leo III., preserved in the sacristy of St Peter's at Rome. Byzantine work, probably of the 12th century.**

Fine examples of ecclesiastical work which have been preserved. The costumes of men and women, as well as curtains and hangings and such articles of domestic use, were often richly adorned with embroidery. These have mostly perished; while the careful preservation and comparatively infrequent use of the vestments and other objects devoted to the service of the church have given us tangible evidence of the attainments of the medieval embroiderer. Much of this work was produced in convents, but old documents show that in monasteries also were to be found men known for their skill in needlework. Other names, both of men and women, are recorded, showing that the craft was by no means exclusively confined to monastic foundation. Gilds of embroiderers existed far back in medieval times.

In England the craft has been a favourite employment for many centuries, and persons of all ranks have occupied their spare hours at needlework. Some embroidered fragments, found in 1826-1827 in the tomb of St Cuthbert at Durham, and now kept in the cathedral library, were worked, chiefly in gold thread, by order of Ælfricæ, queen of Edward the Elder, for Fridestan, bishop of Winchester, early in the 10th century.

1 Both are illustrated in F. Bock, *Die Kleindien*.

**EMBROIDERY**
EMBROIDERY

embroidered with figures of St Peter and St Eloy, may be regarded as representative of 14th-century work. An altar-frontal with the Annunciation embroidered in silks and gold and silver upon a blue silk damask ground, now in the museum at Lille, is a very beautiful example of Franco-Flemish art in the second half of the 15th century. It was originally in the church at Noyelles-Seclin. An embroidery more characteristically French, and belonging to the same century, is in the museum at Chartres. It is a triptych, having in the middle a pietà, on the left wing St John the Evangelist, and on the right St Catherine of Alexandria. Each leaf has a canopy of architecture represented in perspective. In the 16th century an effective style of embroidery was practised in France; the pattern is generally a graceful combination of floral and scroll forms, cut out of velvet, satin or silk, and applied to a thick woollen cloth. Later work, chiefly of a floral character, has served for the decoration of costumes, ecclesiastical vestments, curtains and hangings, and the seats and backs of chairs.

Under the rule of the dukes of Burgundy in the 15th century art in the southern provinces of the Netherlands prospered greatly, and able artists were found to meet the wishes of those munificent rulers. The local schools of painting, which flourished under their patronage, appear to have very considerably influenced the embroiderers' art. Great care and pains were given to reproduce as accurately as possible the painted cartoon or picture which served as the model. The heads are individualized, and the folds of the draperies are laboriously worked out in detail. The masonry of buildings, the veinings of marble, and the architectural enrichments are often represented with careful fidelity, and landscape backgrounds are shown in every detail. As in the case of the tapestries of the Netherlands—the finest which the world has seen—there can be no doubt that patrons of art and donors, when requiring embroideries to be made, secured the services of eminent painters for the designs. There are many examples of such careful work. A set of vestments known as the ornement de la Toison d’Or, now in the Hof-museum at Vienna, is embroidered in the most minute manner with sacred subjects and figures of saints and angels. The stiff disposition of many of these figures, within flattened hexagons arranged in zones, is not pleasing, but the needlework is most remarkable for skill and carefulness. They are of 15th-century work. A cope belonging to the second half of that century was given to the cathedral of Tournai by Guillaume Fillatre, abbot of St Bertin at St Omer, and bishop of Tournai (d. 1473). It is now in the museum there. Upon the orphreys and hood are represented the seven Works of Mercy. The body of the cope, of plain red velvet, is powdered with stags’ heads and martlets (the heraldic bearings of the bishop); between the antlers of the stags is worked in each case the initial letter of the bishop’s name, and the more is embroidered with his arms. Some panels of embroidery, once decorating an altar in the abbey of Grimbergen, and now at Brussels, illustrate the best class of Flemish needlework in the 16th century. The scenes are taken from the Gospel: the marriage at Cana, Christ in the house of the Pharisee, Christ in the house of Zacchaeus, the Last Supper, and the supper at Emmaus. In the museum at Bern there are some embroideries of great historic and artistic interest, found in the tent of Charles the Bold, duke of Burgundy, after his defeat at Granson in 1476. They include some armarial panels and two tabards or heralds’ orns. A tableau of the following century with the royal arms of Spain in applied work, and most probably of Flemish origin, is preserved in the archaeological museum at Ghent.

The later art of Holland was largely influenced by the Dutch conquests in the East Indies at the end of the 16th century, and the subsequent founding of the Dutch East India Company. Embroideries were among the articles produced in the East under Dutch influence for exportation to Holland.

Much embroidery for ecclesiastical purposes has been executed in Belgium of late years. It follows medieval models, but is lacking in the qualities which make those of so much importance in the history of the art.

There is perhaps little worthy of special notice in Italy before the beginning of the 14th century, but the embroideries produced at that time show great skill and are very beautiful. The names of two Florentine embroiderers of the 14th century—both men—have come down to us, inscribed upon their handiwork. Fine work of an altar, very delicately worked in gold and silver and silks of many colours, is preserved in the archaeological museum at Florence. The subject in the middle is the coronation of the Virgin; on either side is an arcade with figures of apostles and saints. The embroiderer’s name is worked under the central subject: Jacobus Cambi de Florititia me fecit MCCCLXXVIII. The other example is in the basilica at Manresa in Spain. It also is an altar-frontal, worked in silk and gold upon an embroidered gold ground. There is a large central panel representing the Crucifixion, with nine scenes from the Gospel on each side. The embroidered inscription is as follows: Geri Lapi rachamator me fecit in Florentia. It is of 14th-century work. An embroidered orphrey in the Victoria and Albert Museum belongs to the early part of the same century. It represents the Annunciation, the coronation of the Virgin and figures of apostles and saints beneath arches. In the spandrels are the orders of angels with their names in Italian. In the best period of Italian art successful painters did not disdain to design for embroidery. Francesco Squarcione (1394-1474), the founder of the Paduan school of painting, and master of Mantegna, is called in a document of the year 1425 a tailor and embroiderer (sartor et recamator). It is recorded that Antonio del Pollaiuolo painted cartoons which were carried out in embroidery,1 and Piero del Vaga, according to Vasari, did likewise. In the 16th and 17th centuries large numbers of towels and linen covers were embroidered in red, green or brown silk with borders of floral patterns, sometimes (especially in the southern provinces) combined with figure subjects and bird and animal forms (Plate IV. fig. 15). Another type of embroidery popular at the same time, both in Italy and Spain, is known as appliqué (or applied) work. The pattern is cut out and applied to a bright-coloured ground, frequently of velvet, as in the example illustrated (Plate III. fig. 14). The later embroidery of Sicily follows that of the mainland. A remarkable coverlet, quilted and padded with wool so as to throw the design into relief, is shown to be of Sicilian origin by the inscriptions which it bears.

1 Some embroideries from vestments, designed by Pollaiuolo, are still preserved in the Museo dell’Opera del Duomo, Florence.

Fig. 5.—Oval picture in silk embroidery: Fame scattering Flowers over Shakespeare’s Tomb. English work of the 18th century.
Fig. 11.—SILK PANEL, EMBROIDERED WITH A HANGING LANTERN.
Chinese work of the 17th or 18th century. Scale: 1/6th.

English work of the later part of the 17th century. Scale: 1/6th.

Fig. 14.—APPAREL FOR A DALMATIC OF GREEN VELVET, EMBROIDERED WITH AN APPLIQUE PATTERN.
Italian work of the 16th century. Scale: 1/6th.
Fig. 15.—PORTION OF THE BORDER OF A LINEN COVER, EMBROIDERED WITH A FIGURE OF ST CATHERINE OF ALEXANDRIA AND KNEELING VOTARIES. Italian work of the 16th century. Scale: 5ths.

Fig. 16.—LINEN BORDER, EMBROIDERED WITH DEBASED FIGURES, BIRDS AND ANIMALS AMID FLOWERS. Cretan work, dated 1762. Scale: 5ths.
(Plate VI. fig. 13). It represents scenes from the story of Tristan, agreeing in the main part with the novella entitled "La Tavola Rotonda a l'istoria di Tristano." The quilt dates from the end of the 14th century. Many pattern-books for embroidery and lace were published in Italy in the 16th and 17th centuries.1

In the greater part of the Spanish peninsula art was for many centuries dominated by the Arabs, who overran the country in the 8th century, and were not finally subdued until the end of the 15th. Hispano-Moorish embroideries of the medieval period usually have interlacing patterns combined with Arabic inscriptions. In the 15th and 16th centuries Italian influence becomes evident. Later the effects of the Spanish conquests in Asia are seen. Eastern influence is, however, stronger in the case of the Portuguese, who seized Goa, on the west coast of the Indian peninsula, early in the 16th century, and during the whole of that century held the monopoly of the eastern trade. Many large embroideries were produced in the Indies, showing eastern floral patterns mingled with representations of Europeans, ships and coats of arms. Embroideries done in Portugal in the 16th and 17th centuries strongly reflect the influence of oriental patterns.

German embroidery of the 12th and 13th centuries adheres closely to the traditions of Byzantine art. A peculiarity of much medieval German work is a tendency to treat the draperies of the figures as flat surfaces to be covered with diaper patterns, showing no folds. A cope from Hildesheim cathedral, now in the Victoria and Albert Museum, is a typical illustration of such work, dating from the end of the 13th century. It is embroidered in silk upon linen with the martyrdom of apostles and saints. Other specimens of embroidery in this manner may be seen at Halberstadt. An altar-frontal from Rupertsburg (Bingen), belonging to the earlier years of the 13th century, is now in the Brussels museum. It is of purple silk, embroidered with Christ in majesty and figures of saints. It was no doubt made in the time of St. Otton, Archbishop of Mainz (1021-1230), who is represented upon it. A type of medieval German embroidery is done in white linen thread on a loose linen ground—a sort of darned-work (Plate II. fig. 10). Earlier specimens of this work are often diversified by using a variety of stitches tending to form diaper patterns. The use of long scrolling bands with inscriptions explaining the subjects represented is more usual in German work than in that of any other country. In the 15th century much fine embroidery was produced in the neighbourhood of Cologne. Later German work shows a preference for bold floral patterns, sometimes mingled with heraldry; the larger examples are often worked in wool on a woollen cloth ground (Plate II. fig. 8). The embroidery of the northern nations (Denmark, Scandinavia, Iceland) was later in development than that of the southern peoples. Figure subjects evidently belonging to as late a period as the 17th century are still disposed in formal rows of circles, and accompanied by primitive ornamental forms (Plate III. fig. 11). A remarkable early embroidered fabric covers the reliefs of St. Knud (Canute, king of Denmark, 1080-1086) in his shrine in the church dedicated to him at Odense. It is apparently contemporary work. The pattern consists of displayed eagles within oval compartments, in blue on a red ground.

In Greece and the islands of the eastern Mediterranean embroidery has been much employed for the decoration of costumes, portières and bed-curtains. Large numbers have been acquired in Crete (Plate IV. fig. 16), and patterns of a distinctive character are also found in Rhodes, Cos, Patmos and other islands. Some examples show traces of the influence of the Venetian trading settlements in the archipelago in the 16th and 17th centuries. Among the Turks a great development of the arts followed upon the conquest of Asia Minor and the Byzantine territory in Europe. Their embroideries show a preference for floral forms—chiefly roses, tulips, carnations and hyacinths—which are treated with great decorative skill.

The use of embroidery in Asia—especially in India, China, Turkestan and Persia—dates back to very early times. The conservatism of all these peoples renders the date of surviving examples often difficult to establish, but the greater number of such embroideries now to be seen in Europe are certainly of no great age.

India has produced vast quantities of embroideries of varying excellence. The fine woolen shawls of Kashmir are widely famed; their first production is supposed to date back to a remote period. The somewhat gaudy effect of many Indian embroideries is at times intensified by the addition of beetles' wings, tinsel or fragments of looking-glass. China is the original home of the silkworm, and the textile arts there reached an advanced stage at a date long before that of any equally skilful work in Europe. Embroideries worked there are generally in silk threads on a ground of the same material. Such work is largely used for close figured or obscured forms of broad screens, banners, chair-covers and table-hangings. The ornaments upon the robes especially are prescribed according to the rank of the wearer. The designs include elaborate landscapes with buildings and figures, dragons, birds, animals, symbolic devices, and especially flowers (Plate III. fig. 11). Dr Bushell states that the stuff to be embroidered is first stretched upon a frame, on pivots, and that pattern-books with woodcuts have been published for the workers' guidance. A kind of embroidery exported in large quantities from Canton to Europe rivals painting in the variety and gradation of its colours, and in the smoothness and regularity of its surface.

Embroidery in Japan resembles in many ways that of China, the country which probably supplied its first models. As a general rule, Japanese work is more pictorial and fanciful than that of China, and the stitching is looser. It frequently happens that the embroidery, though clearly inspired by some work of the embroidered work, and in other cases the needle has been an accessory upon a fabric already ornamented with printing or painting. Japanese work is characterized generally by bold and broad treatment, and special skill is shown in the representation of landscapes—figures, rocks, waterfalls, animals, birds, trees, flowers and clouds being each rendered by a few lines. More elaborate are the large temple hangings, the pattern being frequently thrown into relief, and completely covering the ground material.

Embroidery in Persia has been used to a great extent for the decoration of carpets, for prayer or for use at the bath (Plate V. fig. 17). Robes, hangings, curtains, tablecovers and portières are also embroidered. A preference is shown for floral patterns, but the Mahomedans of Persia had no scruples about introducing the forms of men and animals—the former engaged in hawking or hunting, or feasting in gardens. Panels are embroidered with close figured figures of flowers, leaves and clouds, or with inches of silk into loose trousers for women, now obsolete. The embroidered shawls of Kerman are widely celebrated. Hangings and covers of cloth patchwork have been embroidered in many parts of Persia, more particularly at Resht and Isphahan.

In Turkestan, and especially at Bokhara, excellent embroideries have been, and are, produced, some patterns being of a bold floral type, and others conventionalized into hooked and serrated outlines. The work is most usually in bright-coloured silks, red predominating, on a linen material.

In North Africa the embroidery of Morocco and Algeria deserves notice; the former inclines more to geometrical forms and the latter to patterns of a floral character.

EMBRUN, a town in the department of the Hautes Alpes in S.E. France. It is built at a height of 280 ft. on a plateau that rises above the right bank of the Durance. It is 27/5 m. by rail from Briançon and 24 m. from Gap. Its ramparts were demolished in 1874. In 1906 the municipal pop. (including the garrison) was 3752. Besides the Tour Brune (11th century) and the old archiepiscopal palace, now occupied by government offices, barracks, &c., the chief object of interest in Embrun is its splendid cathedral church, which dates from the second half of the 12th century. Above its side door, called the Rèal, there existed till 1585 (when it was destroyed by the Huguenots) a fresco, probably painted in the 13th century, representing the Madonna: this was the object of a celebrated pilgrimage for many centuries. Louis XI. habitually wore on his hat a leaden image of this Madonna, for which he had a very great devotion, since between 1440 and 1461, during the lifetime of his father, he had been the dauphin, and as such ruler of this province.

Embrun was the Eburodunum or Ebredunum of the Romans, and the chief town of the province of the Maritime Alps. The episcopal see was founded in the 4th century, and became an archbishopric about 800. In 1147 the archbishops obtained from the emperor Conrad III. very extensive temporal rights, and the rank of princes of the Holy Roman Empire. In 1232 the county of the Embrunais passed by marriage to the dauphins of Viennois. In 1791 the archiepiscopal see was suppressed, the region being then transferred to the diocese of Gap, so that the once metropolitan cathedral church is now simply a parish church. The town was sacked in 1585 by the Huguenots and in 1662 by the duke of Savoy. Henri Arnaud (1641-1721), the Waldensian pastor and general, was born at Embrun.

EMBRYOLOGY. The word embryo is derived from the Gr. ἐμμέποιον, which signified the fruit of the womb before birth. In its strict sense, therefore, embryology is the study of the intrauterine young or embryo, and can only be pursued in those animals in which the offspring are retained in the uterus of the mother until they have acquired, or nearly acquired, the form of the parent. As a matter of fact, however, the word has a much wider application than would be gathered from its derivation. All animals above the Protozoa undergo at the beginning of their existence rapid growth and considerable changes of form and structure. During these changes, which constitute the growing stage of the animal, the young organism may be incapable of leading a free life in the state of the body obtained by itself from the egg in such cases it is either contained in the body of the parent or it is protruded and lies quiescent within the egg membranes; or it may be capable of leading an independent life, possessing in a functional condition all the organs necessary for its maintenance of its existence. In the former case the young organism is called an embryo, in the latter a larva. It might thus be concluded that embryology would exclude the study of larvae, in which the whole or the greater part of the development takes place outside the body of the egg. But this is not the case; embryology includes not only a study of embryos as just defined, but also a study of larvae. In this way the scope of the subject is still further widened. As long as embryology confines its attention to embryos, it is easy to fix its limits, at any rate in the higher animals. The domain of embryology ceases in the case of viviparous animals at birth, in the case of oviparous animals at hatching; it ceases as soon as the young form acquires the power of existing when separated from the parent, or when removed from the protection of the egg membranes. But as soon as post-embryonic developmental changes are admitted within the scope of the subject, it becomes on close consideration difficult to limit its range. It must include all the developmental processes which take place as a result of sexual reproduction. A man at birth, when he ceases to be an embryo, has still many changes besides those of simple growth to pass through. The same remark applies to a young frog at the metamorphosis. A chick even, which can run about and feed almost immediately after hatching, possesses a plumage different from that of the different from the form which we are familiar. It might be attempted to meet this difficulty by limiting embryology to a study of all those changes which occur in the organism before the attainment of the adult state. But this merely shifts the difficulty to another quarter, and makes it necessary to define what is meant by the adult state. At first sight this may seem easy, and no doubt it is not difficult when man and the higher animals are in question, for in these the adult state may be defined comparatively sharply as the stage of sexual maturity. After that period, though changes in the organism still continue, they are retrogressive changes, and as such might fairly be excluded from any account of development, which clearly implies progression, not retrogression. But, as so often happens in the study of organisms, formulæ which apply quite satisfactorily to one group require modifications when others are considered. Does sexual maturity always mark the attainment of the adult state? Is the Axolotl adult when it acquires its reproductive organs? Can a larval Ctenophore, which acquires functional reproductive glands and still possesses the power of passing into the form ordinarily described as adult in that group, be considered to have reached the end of its development? Or—to take the case of those animals, such as Amphioxus, Balanoglossus, and many segmented worms in which important developmental processes occur, e.g. formation of new gill slits, of gonadal sacs, or even of whole segments of the body, long after the power of reproduction has been acquired—how is the attainment of the adult state to be defined, for it is clear that in them the attainment of sexual maturity does not correspond with the end of growth and development? If, then, embryology is to be regarded as including not only the study of embryos, but also that of larvae, in that includes the study of the whole developmental history of the individual—and it is impossible to treat the subject rationally unless it is so regarded—it becomes exceeding difficult to fix any definite limit to the period of life with which embryology deals in itself. The beginning of this period can be fixed, but not the end, unless it be the end of life itself, i.e. death. The science of embryology, then, is the science of individual development, and includes within its purview all those changes of form and structure, whether embryonic, larval or post-larval, which characterize the life of the individual. The beginning of this period is precise and definite—it is the completion of the fertilization of the ovum, in which the life of the individual has its start. The end, on the other hand, is vague and cannot be precisely defined, unless it be death, in which case the period of life with which embryology concerns itself is coincident with the life of the individual. To use the words of Huxley ('Cell Theory,' Collected Works, vol. i. p. 267): "Development, therefore, and life are, strictly speaking, one thing, though we are accustomed to limit the former to the progressive half of life merely, and te
The border consists of a wide band set between two narrow ones, each with a waved continuous stem with blossoms in the wavings. Similar floral scrolling and leafy stem ornament fills the space beyond the pointed shape at the upper end, which is edged with acanthus leaf devices. The main ground below the niche or pointed shape is a blossoming plant, with balanced bunches of flowers between which are leaves, formally arranged in a pointed oval shape. Persian work, 18th century, 4 ft. 6 in. x 2 ft. 11 in. (Victoria and Albert Museum.)
Fig. 18.—PART OF A SICILIAN COVERLET, OF THE END OF THE 14TH CENTURY.

It is of white linen, quilted and padded in wool so as to throw the design into relief. The scenes represented, taken from the Story of Tristan, with inscriptions in the Sicilian dialect, are as follows:—

1. COMU: LU AMOROLDE FA BAXDERI: LE OST: IN CORNUAGLIA (How the Morold made the host go to Cornwall);
2. COMU: LE RRE: LANGUIS: MANDA: PER LU TRIBUTU IN CORNUALGIA (How King Languis ordered that the host should go to Cornwall);
3. COMU: LU RRE: LANGUIS: MANDA: PER LU TRIBUTU DI SECTI ANNI (How the host was ordered to go to Cornwall for the tribute);
4. COMU: LU AMOROLDI LAF: LAT: IN CORNUALGIA (How the Morold comes to Cornwall);
5. COMU: LU AMOROLDE: FA SULBARI: LA GENTI (How the Morold made the people pay);
6. COMU: TRISTAINI: DAI: LU GUANTU ALLU AMOROLDU DELA BACTAGLIA (How Tristan gave the glove of battle to the Morold);
7. COMU: LU AMOROLDE: E UNUTU: IN CORNUALGIA: CUM XXXX GALEI (How the Morold is come to Cornwall with forty galleys);
8. COMU: TRISTAINU BICTA: LA UARCA: ARRETU: INTU: ALLU MARU (How Tristan struck his boat behind him into the sea);
9. COMU: TRISTAINU: ASPECTA: LU AMOROLDE: ALLU ISOLA DI LU MARU: SANZA UINSTURA (How Tristan awaits the Morold on the island of Sanza Ventura in the sea);
10. COMU: TRISTAINU: FEIRU LU AMOROLDU IN TESTA (How Tristan wounded the Morold in the head);
11. COMU: LU ESSA: LU AMOROLDE: ASPECTAUA LU PATRU (How the Morold's page awaited his master);
12. COMU: LU AMOROLDE: FEIRU: TRISTAINU A TRADIMENTU (How the Morold wounded Tristan by treachery);

the
that each spermatocyte gives rise to four spermatids. Each spermatid becomes a functional spermatocoele or male gamete. The gametogenesis of the male therefore closely resembles that of the female, differing from it only in the fact that all the four products of the spermatocyte become functional gametes whereas in the female only one, the ovum, becomes functional, the other three (polar bodies) being abortive. In the spermatogenesis of the bee, however, the spermatocytes do not divide once, giving rise to a small polar-body-like structure, called the acrosome.

The nucleus of the male gamete is not called the pronucleus, as would be expected, that term being reserved for the second nucleus which appears in the ovum after fertilization. As in all probability derived entirely from the nucleus of the spermatocyte, the sperm is therefore, in the male, of a single origin and does not proceed by the division of the spermatogonia, as does the egg cell in the female. This is shown in the peculiarities of the first division. In the first place, between the first division and the second it does not enter into the resting state, but immediately proceeds to the second division. In the second place, the number of chromosomes which appear in the final divisions of the prophase and assist in constituting the nuclei of the gametes is half the number which go to constitute the new cell in the ordinary nuclear divisions of the animal. The number of chromosomes of the nucleus of the gamete is therefore one, by which the gametes of the spermatocytes are called reduced (mautice) divisions. It is not certain, however, that this phenomenon is of universal occurrence, or has the significance which is ordinarily attributed to it. In the parthenogenetic forms of Apis mellifica (H. C. Meves, Doncaster, Quart. Journ. Mic. Sc., 49, 1906, pp. 561-589), reduction does not occur, although two polar bodies are formed.

As soon as the spermatocoele has conjugated with the ovum, a second nucleus appears in the ovum. This is undoubtedly derived from the spermatocoele, possibly from its nucleus only, and is called the male pronucleus. It possesses in the adjacent proplast an almost-marked centrosome. The general rule is that the female gamete, in this case, is a centrosome, and that no centrosome appears in the male in the divisions by which the gametes are formed. If this is true, the centrosome of the zygote nucleus must be entirely derived from the female gamete. This fact, which has been often observed, that the female pronucleus is not surrounded by protoplasmic radiations, whereas such radiations are present round the male pronucleus in its approach to the female. In the next place, the female gamete is able to be divided without the presuming the resting form, the centromat being distributed over the nuclear network, and the nuclei to lie side by side in the centre of the egg. A long loop of chromatin then appears in each nucleus and divides up into twos, threes, and fours, whose divisions are normal.

The chromosomes of both nuclei disappear, and a spindle is formed. The twenty-four chromosomes arrange themselves at the centre of this spindle and split longitudinally, so that forty-eight chromosomes are formed. Twenty-four of these, twelve male and twenty-four female, are formed in the first division, and assist in giving rise to the two nuclei. At the next division twenty-four chromosomes appear in each nucleus, each of which divides longitudinally, and so in all subsequent divisions. This is the usual way (Aphi, some Lepidoptera), and is a manner slightly different from that described for the mouse. In Echinus, for instance, the two pronuclei fuse, and the spindle and chromosomes are formed from the zygote nucleus, whereas in the mouse the two pronuclei retain their distinctness during the formation of the chromosomes. There appears, however, to some variation in this respect: cases have been observed in the mouse in which fusion of the pronuclei occurs before the separation of the chromosomes. In parthenogenetic ova of Apis mellifica, and in some saw-flies and gall flies which produce females (L. Doncaster, Quart. Journ. Mic. Sc., 49, 1906, pp. 561-589). Again it has been asserted that in parthenogenetic eggs the polar bodies are not extruded, but are retained intact, such as those of its products which would in other cases be extruded in polar bodies remain in the protoplasm of the ovum. But this is not a universal rule, for in some cases of parthenogenesis polar bodies are extruded, as in those of the Chironomus riparius, and in some fertilized eggs the polar bodies are retained in the ovum.

It is quite probable that parthenogenesis is more common than has been supposed, and it appears that there is some evidence to show that ova, which, in their development without fertilization, may yet develop if subjected to an altered environment. For instance, it has been asserted that the addition of a certain quantity of chloride of magnesium and other substances to sea-water will cause the unfertilized ova of certain marine animals (Aracia, Clathuperus) to develop (J. Leib, Anm. Journ. of Physiol., devol., 1923, p. 325). According to M. Y. Delage (Comptes rendus, 1902, Nos. 15 and 16) such development may occur after the formation of polar bodies, the chromosomes undergoing reduction and the full number being regained in the segregating stage. These experiments, if authenticated, are proof that parthenogenesis is not only possible, but that it is able to exercise in its normal surroundings. There is reason to believe that the same assertion may be made of spermatogenesis. Phenomena of the nature of parthenogenesis have never been observed in the female, and it is not likely that they are present in the male, as is shown by the following facts: if a male insect is allowed to copulate with a female, the male is found dead the next day, and this is followed by the death of the female and her progeny. This is the case with most insects, and it is evident that the male has been killed by the female. It is probable that the male is killed by the female, and that this is followed by the death of the female and her progeny. This is the case with most insects, and it is evident that the male has been killed by the female. It is probable that the male is killed by the female, and this is true, is probably due to an affection of the gametes and not the young zygote. For a review of the whole subject see L. Cuénot, Bull. Sc. France et Belgique, xxxii., 1899, pp. 452-

316 EMBRYOLOGY [DEVELOPMENT.

Fertilization.

Parthenogenesis.

The question of the determination of sex may be alluded to here. Is sex determined at the act of conjugation of the two gametes? Is not the sex of the zygote an unalterable character? Or does something happen to the zygote during the development of the egg? In males the zygote is always of the same sex, and it appears to favour the view that sex is an unalterable, inherent character. Thus those twins which are believed to come from a split zygote are always of the same sex, members of the same litter which have been raised until they are grown. It is not possible to determine the sex of the sex of the young animal, and all attempts to determine the sex of offspring in the higher animals by treatment have failed. On the other hand, the male bee is a portion of a female zygote—the queen-bee. The same remark applies to the male Rotifer, in which the zygote always retains the same sex, and it is not possible to determine the sex of the offspring by the same methods. But in these cases it does not appear that the production of males is in any way affected by external conditions (see R. C. Punnett, Proc. Royal Soc., 78 B, 1906, p. 223). It is said that in human society the sons of two sons are more likely to be sons than the daughters of two sons are likely to be daughters, but this, it is true, is probably due to an affection of the gametes and not the young zygote. For a review of the whole subject see L. Cuénot, Bull. Sc. France et Belgique, xxxii., 1899, pp. 452-

becomes arranged in the manner ordinarily spoken of as cellular. This division of the nucleus is effected by the process called binary fission; that is to say, it first divides into two, then each of these divides simultaneously again into two, giving four nuclei; each of these after a pause again simultaneously divides into two. So the process continues for some time until the ovum becomes possessed of a large number of nuclei, all of which have proceeded from the original nucleus by a series of binary fissions. This division of the nucleus, which constitutes the essential part of the cleavage of the ovum, continues through the whole of life, but it is only in the earliest period that it is distinguished by a distinct name and used to characterize a stage of development. The nuclear division of cleavage is usually at first a rhythmic process; all the nuclei divide simultaneously, and periods of nuclear activity alternate with periods of rest. Nuclear divisions may be said to be of three kinds, according to the accompanying changes in the surrounding protoplasm: (1) accompanied by no visible change, e.g. the multinucleated Protozoan Actinophrysium; (2) accompanied by a rearrangement of the protoplasm around each nucleus, but not by its division into two separate masses, e.g. the dividing cell of a developing protozoa; (3) accompanied by the division of the protoplasm into two parts, so that two distinct cells result, e.g. the divisions by which the free wandering leucocytes are produced, the reproduction of uninuclear Protozoa, &c. In the cleavage of the ovum the first two of these methods of division are found, but probably not the third.

At one time it was thought that the nuclear divisions of cleavage were always of the third kind, and the result of cleavage was supposed to be a mass of isolated cells, which became reunited in the subsequent development to give rise to the later connexion between the tissues which were known to exist. But in 1885 it was noticed that in the ovum of Peripatus capensis (A. Sedgwick, Quart. Journ. Mic. Science, xxv., 1885, p. 449) the extranuclear protoplasm did not divide in the cleavage of the ovum, but merely became rearranged round the increasing nuclei; the continuity of the protoplasm was not broken, but persisted into the later stages of growth, and gave rise to the tissue-connexions which undoubtedly exist in the adult. This discovery was of some importance, because it rendered intelligible the unity of the embryos, in which the processes of reproduction are concerned, and of the maintenance of this unity being somewhat surprising on the previous view. On further inquiry and examination it was found that the ova of many other animals presented a cleavage essentially similar to that of Peripatus. Indeed, it was found that the nuclear divisions of cleavage were of the first two kinds just described. In some eggs, e.g. the Alcynaria, the first nuclear divisions are effected on the first plan, i.e. they take place without at first producing any visible effect upon the protoplasm of the egg. But in the later stages of cleavage the protoplasm becomes arranged around each nucleus and related to it as a centre. In the majority of eggs, however, the protoplasm, though not undergoing complete cleavage, becomes rearranged round each nucleus as these are formed. The best and clearest instance of this is afforded by many Arthropodan eggs, in which the nucleus of the just-formed zygote takes up a central position, where it undergoes its first division, subsequent divisions taking place entirely within the egg and not in any way affecting its exterior. The result is to give rise to a nucleated network or foam-work of protoplasm, which includes the yolk-threads and containing these in its meshes.

In other Arthropodan eggs the cleavage is on the so-called centrifugal type, in which the dividing nuclei pass to the cortex of the ovum, and the surface of the ovum becomes indented with grooves corresponding to each nucleus. In this kind of cleavage all the so-called segments are contiguous with the central undivided yolk-mass. It sometimes happens that in Arthropods the egg breaks up into masses, which cannot be said to have the value of cells, as they are frequently without nuclei. In other eggs, characterized by a considerable amount of yolk, e.g. the ova of Cephalopoda, and of the Vertebrata with much yolk, the first nucleus takes up an eccentric position in a small patch of protoplasm which is comparatively free from yolk-particles. This patch is the germinal disc, and the nuclear divisions are confined to it and to the transitional region, where it merges into the denser yolk which makes up the bulk of the egg. At the close of segmentation the germinal disc consists of a number of nuclei, each surrounded by its own mass of protoplasm, which is, however, not separated from the protoplasm round the neighbouring nuclei, as was formerly supposed, but is continuous at the points of contact. In this manner the germinal disc has become converted into the blastoderm, which consists of a small watch-glass-shaped mass of so-called cells resting on, but continuous with, the large yolk-mass. It is characteristic of this kind of ovum that there is always a row of nuclei, called the yolk-nuclei, placed in the denser yolk immediately adjacent to the blastoderm. These nuclei are continually undergoing division, one of the products of division, together with a little of the sparse yolk protoplasm, passing into the blastoderm to reinforce it (so-called formative cells). The other product of the dividing yolk-nuclei remains in the yolk, in readiness for the next division.

In this manner nucleated masses of protoplasm are continually being added to the development of the blastoderm and assisting in its growth. But it must be borne in mind that all the nucleated masses of which the blastoderm consists are in continuity with each other and with the sparse protoplasmic reticulum of the subjacent yolk.

In the great majority of eggs, then, the nuclear division of cleavage is not accompanied by a complete division of the ovum into separate cells, but only by a rearrangement of the protoplasm, which produces, indeed, the so-called cellular arrangement, and an appearance only of separate cells. But there still remain to be mentioned those small eggs in which the amount of yolk is inconsiderable, and in which division of the nuclei does appear to be accompanied by a complete division of the surrounding protoplasm into separate unconnected cells—ova of many Annelida, Monilusca, Echinoderma, &c., and of Mammalia amongst Vertebrata. In the case of these also (G. F. Andrews, Zool. Bulletin, ii., 1869) it has been shown that the apparently separate spheres are connected by a number of fine anastomosing threads of a hyaline protoplasm, which are not easily to detect and are readily destroyed by the action of reagents. It is therefore probable that the divisions of the nuclei in cleavage are in no case accompanied by complete division of the surrounding protoplasm, and the organism in the cleavage stage is a continuous whole, as it is in all the other stages of its existence.

Of late years a great number of experiments have been made to discover the effects of dividing the embryo during its cleavage, and of destroying certain portions of it. These experiments have been made with the object of testing the view, held by some authorities, that certain segments are already set apart in cleavage to give rise to certain adult organs, so that if they were destroyed the organs in question could not be developed. The results obtained have not borne out this view. Speaking generally, it may be said that they have been different according to the stage at which the separation was effected and the conditions under which the experiment was carried out. If the experiment be made at a sufficiently early stage, each part, if not too small, will develop into a normal, though small, embryo. In some cases the embryo remained imperfect in a certain stage after the experiment, but the loss was generally made good by regeneration. (For a summary of the work done on this subject see R. S. Bergh, Zool. Centralblatt, vii., 1900, p. i.)

The end of cleavage is marked by the commencement of the differentiation of the organs. The first differentiation is the formation of the layers. These are three in number, being called respectively the ectoderm, endoderm and mesoderm, or, in embryos in which at their first appearance they lie like sheets one above the other, the epiblast, hypoblast and mesoblast. The layers are sometimes spoken of as the primary organs, and their importance lies in the fact that they are supposed to be generally homologous throughout the series of the Metazoa. This view, which is based partly
on their origin and partly on their fate, had great influence on the science of comparative anatomy during the last thirty years of the 19th century, for the homology of the layers has been admitted, they afforded a kind of final court of appeal in determining questions of doubtful homologies between adult organs. Great importance was therefore attached to them by embryologists, and both their mode of development and the part which they play in forming the adult organs were examined with the greatest care. It is very unusual for all the layers to be established at the same time. As a general rule the ectoderm and endoderm, which may be called the primary layers, come first, and later the mesoderm is developed from one or other of them. There are two main methods in which the first two are differentiated—invagination and delamination. The former is generally found in small eggs, in which the embryo at the close of cleavage assumes the form of a sphere, having a fluid or gelatinous material in its centre, and bounded externally by a thin layer of protoplasm, in which all the nuclei are contained. Such a sphere is called a blastosphere, and may be regarded as a spherical mass of protoplasm, of which the central portion is so much vacuolated that it seems to consist entirely of fluid. The central part of the blastosphere is called the segmentation cavity or blastocoel. The blastosphere soon gives rise, by the invagination of one part of its wall upon the other, and a consequent obliteration of the segmentation cavity, to a double-layered one with a wide opening, which, however, soon becomes narrowed to a small pore. This cup-stage is called the gastrula stage; the outer wall of the gastrula is the ectoderm, and its inner the endoderm; while its cavity is the ententeron, and the opening to the exterior the blastopore. Origin of the primary layers by delamination occurs universally in eggs with large yolks (Cephalopoda and many Vertebrae), and occasionally in others. In it cleavage gives rise to a solid mass, which divides by delamination into two layers, the ectoderm and endoderm. The main difference between the two methods of development lies in the fact that in the first of them the endoderm at its first origin shows the relations which it possesses in the adult, namely, of forming the epithelial wall of the ententeron space, whereas in the second method the endoderm is at first a solid mass, in which the ententeric space makes its appearance later by excavation. In the delaminate method the ententeric space is at first without a blastopore, and sometimes it never acquires this opening, but a blastopore is frequently formed, and the two-layered gastrula stage is reached, though by a very different route from that taken in the formation of the invaginated gastrula. According to the layer-theory, these two layers are derived from a homogeneous series of cells. Hence it can always be accurately defined, they give rise to the same organs in all cases, and the adult organs (excluding the mesodermal organs) can be traced back to one or other of them with absolute precision. Thus the ectoderm gives rise to the epidermis, to the nervous system, and to the lining of the stomodeum and proctodeum, if such parts of the alimentary canal are present. The endoderm, on the other hand, gives rise to the lining of the ententeron, and of the glands which open into it.

So far as these two layers are concerned, and excluding the mesoderm, it would appear that the layer-theory does apply in a very remarkable manner to the whole of the Metazoa. But even here, when the actual facts are closely examined, there are found to be difficulties, which appear to indicate that the theory may not perhaps be such an infallible guide as it seems at first sight. Leaving out of consideration the case of the Mammalia, in which the differentiation of the segmented ovum is not into ectoderm and endoderm, and the case of the sponges, the most important of these difficulties concern the stomodeum and proctodeum. The best case to examine is that of *Peripatus capensis*, in which the blastopore is at first a long slit, and gives rise to the mouth and the anus of the adult. Here there is always found at the lips of the blastopore, and extending for a short distance inwards as ententeric lining, a certain amount of tissue, which by its characters must be regarded as ectoderm. Now, in the closure of the blastopore between the mouth and anus, this tissue, which at the mouth and anus develops into the lining of the stomodeum and proctodeum, is left inside, and actually gives rise to the median ventral epithelium of the alimentary canal. Hence the development of *Peripatus capensis* suggests the conclusion, if we strictly apply the layer-theory, that a considerable portion of the true mesentery is lined by ectoderm, and is not homologous with the corresponding portion of the mesentery of other animals—a conclusion which will on all hands be admitted to be absurd. The difficulties in the application of the layer-theory become vastly greater when the origin and fate of the mesoderm is considered. The mesoderm is, if we may judge from the number of organs which are derived from it, much the most important of the three layers. It generally arises later than the others, and in its very origin presents difficulties to the theory, which are much increased when we consider its history. It is generally, though not always, developed from the endoderm, either as hollow outgrowths containing prolongations of the ententeric cavity, which become the coelom, or as solid proliferations. But in some groups the mesoderm is actually laid down in cleavage, and is present at the end of that process. In others it is entirely derived from the ectoderm (*Peripatus capensis*). In yet others it is partly derived from endoderm and partly from ectoderm (primitive streak of amniotic Vertebrae). Finally, in whatever manner the first rudiments are developed, it frequently receives considerable reinforcements from one of the primary layers. For example, it is as the neural crest of the vertebrate embryo is not, as was formerly supposed, exclusively concerned with the formation of the spinal nerves and ganglia, but contributes largely to the mesoderm of the axial region of the body. This is particularly clearly seen in the case of the anterior part of the head of Elasmobranch and probably of other vertebrate embryos, where all the mesoderm present is derived from the anterior part of the neural crest (*Quart. Journ. Mic. Science*, xxxvii. p. 92).

The layer-theory, then, will not bear critical examination. It is clear, both from their origin and history, that the layers or masses of cells called ectoderm, endoderm and mesoderm have not the same value in different animals; indeed, it is misleading to speak of three layers. At the most we can only speak of two, for the mesoderm is formed after the others, has a composite origin, and has no more claim to be considered an embryonic layer than has the rudiment of the central nervous system, which in some animals, indeed, appears as soon as the mesoderm. Arguments as to homology, based on derivation or non-derivation from the same embryonic layer, have therefore in themselves little value.

It has frequently been asserted that the reproductive cells are marked off at a very early stage of the development (*Sagitta*, certain Crustacea, *Scorpio*). Recently it has been asserted that in *Ascaris* (T. Boveri, *Kupffer's Pestschrift*, 1899, p. 335), the reproductive cells are already apart after the first cleavage, and that they can be traced by certain peculiarities of their nuclei into the adult reproductive glands.

It has been already stated that the mesoderm is a composite tissue. This fact is often frequently considered from its first establishment. In many Coelomata it is present under two forms from the beginning. One of these is epithelial in character, while the other has the form of a network of protoplasm, with nuclei at the nodes. The former is called simply epithelial mesenchyme, the latter mesenchyme. In the first, the epithelial mesoderm is the first formed, and what little mesenchyme there is is derived from it (*Amphioxus, Balanoglossus, &c.*). Sometimes the mesenchyme is the first to arise, the epithelial mesoderm developing later from it (not, that is to say, necessarily from the same stock). It sometimes happens that these two kinds of tissue arise separately from one or other of the primary layers (Echinodermata). As already hinted, in *Balanoglossus* and *Amphioxus* the whole of the mesoderm of the body is derived from the epithelial layer, in which homologous throughout the greater part of the gut-wall. In *Peripatus capensis* also, and possibly in other AnthroPods, it has at first an intermediate form, being derived from a primitive streak and not from the gut-wall, but it rapidly assumes an epithelial structure, from which all the mesodermal tissues are developed. In Annelids the bulk of the mesoderm has at first a modified epithelial form similar to that of AnthroPods, but it is formed, not from a primitive streak, but from some peculiar cells produced in cleavage, called pole-cells. In Annelids with trocho-
stage and gives rise to the muscular bands of the young larva. In Echinoderma a certain amount of mesenchyme appears before the epiblastic mesoderm, which is formed later as gut-diverticula. In these forms the mesenchyme is said to arise as wandering ameboid cells in the mesoderm, and to traverse the blastula, before and during its invagination, but the writer has reason to believe that this account of it does not quite describe what happens. It would seem to be more probable that the mesenchyme arises in these forms by a simple budding off of the layer of mesenchyme of the Vertebrate embryo, as a protoplasmic outflow from its tissue origin, passing at first along the line of pre-existent protoplasmic strands which traverse the blastocoel, and sending out at the latter stages isolated streams and masses, which are afterwards called the so-called mesenchyme of the Vertebrate embryo.

In the Vertebrate the whole of the mesoderm has at first the mesenchyme form. Afterwards, when the body-cavity split appears it is found that a considerable portion of the mesenchyme has become detached from the body-wall and, indeed, it is very remarkable that there is no effective way of telling whether it is mesoderm or mesenchyme, which later on yields by a process of outflow very similar in its character to what has been supposed to occur in the Echinoderm blastula, a considerable mesenchyme of the reticulate character. Mesenchyme is the tissue which in Vertebrate embryology has frequently been called embryonic connective tissue. This name is no doubt due to the fact that it was supposed to consist of isolated stellate cells. It is, however, in no sense of the word connective tissue, because it gives rise to many organs having nothing whatever to do with connective tissue. For instance, in Vertebrate this tissue gives rise to nervous tissue, blood-vessels, renal tubules, smooth muscular fibres, and other structures, as well as to connective and skeletal tissues. The Vertebrate, indeed, is the remarkable fact in the Vertebrate mesoderm that it has been supposed to arise as mesoderm, e.g. the epidermal lining of the body-cavity, and of the renal tubules and urinary tracts, all pass through the mesenchymous condition, whereas in Amphioxus, Balanoglossus and presumably Sphyraena and the other Osteichthyes the mesodermal tissues are always of an epithelial condition, most of the mesodermal tissues of the adult retaining this condition permanently. As has been implied in the above account, mesenchyme is usually formed from epithelial mesoderm on the somatic side, and from the mesenchyme of the endoderm. It is also sometimes formed from ectoderm, as in the Vertebrata at the nerve crest and other places. In some Coelenterata also it appears certain that the ectoderm does furnish tissue of a mesenchymatous nature, but from the tissues destined for this purpose takes place comparatively late in life, at any rate after the embryonic period. In this connexion it may be interesting to point out that in many Coelenterata all the tissues of the body retain throughout the course of its development a condition, nothing comparable to mesenchyme ever being formed.

Finally, before leaving this branch of the subject, the fact that the three germinal layers are continuous with one another, and not isolated masses of tissue, may be emphasized. Indeed, an embryo may be defined as a multinucleated protoplasmic mass, in which the protoplasm at any surface—whether internal or external—is in the form of a relatively dense layer, which in the interior is much vaculated and reduced to a more or less sparse reticulum, the nuclei either being exclusively found in the surface protoplasm, or if the embryo has any bulk and the internal reticulum is at all well developed, at the nodes of the internal reticulum as well.

The origin of some of the more important organs may now be considered. It is a remarkable fact that the mouth and anus develop in the most diverse ways in different groups, but as a rule either one or both of them can be traced into relation with the blastopore, the history of which must therefore be examined. In most, if not all, the great groups of the animal kingdom, e.g. in Coelenterata, Annelida, Mollusca, Vertebrata, and in Arthropoda, the blastopore or its representative is placed on the neural surface of the body, and, as will be shown later on, within the limits of the central nervous rudiment. Here it undergoes the most diverse fate, even in members of the same group. For instance, in Peripatus capensis it extends as a slit along the ventral surface, which closes up in the middle, but remains open at the two ends as the permanent mouth and anus. In other Arthropods, though full details have not yet in all cases been worked out, the following general statement may be made:—A blastopore (certain Crustacea) or its representative is formed on the neural surface of the embryo and always becomes closed, the mouth and anus being indubitably determined in several cases by the blastopore region. In many others there is no doubt that the mouth and anus throughout the group; yet within the limits of a single genus—Peripatus—they show the most diverse modes of development. In Annelida the blastopore sometimes becomes the mouth (most Chaetoptera); sometimes it becomes the anus (Serpula); sometimes it closes up, giving rise to neither, though in this case it may assume the form of a long slit along the ventral surface before disappearing. In Mollusca its fate presents the same variations as in Annelida. Now in these groups no zoologist would deny the homology of the mouth and anus in the different forms, and yet how very different is their history even in closely allied animals. How are these apparently diverse facts to be reconciled? The only satisfactory explanation which has been offered (Sedgwick, Quart. J. Mic. Science, xxiv., 1884, p. 43) is that the blastopore is homologous in all the groups mentioned, and is the representative of the original single opening into the enteric cavity, such as at present characterizes the Coelenterata. From it the mouth and anus have been derived, as is indicated by its history in Peripatus capensis, and by the variability in its behaviour in closely allied forms; such variability in its subsequent history is due to its specialization as a larval organ, as a result of which it has lost its capacity to give rise to both mouth and anus, and sometimes to either.

That the blastopore does become specialized as a larval organ is obvious in those cases in which it becomes transformed into the single opening with which some larvae are, for a time at least, alone provided, e.g. Pédium, Echinoderm larvae, &c., and that larval characters, strong reason to believe will be adduced later on. In the Vertebrata the behaviour of the blastopore (anus of Rusconi) is also variable in a very remarkable manner. As a rule it is slit-like in some animals, but in others it may be single or double. Thus it remains open longer than the rest, as the neuromeric canal. In a few forms (e.g. Newt, Lepidodriss, &c.) the tipmost portion of the slit-like blastopore remains permanently open as the anus, and from such a slit-like condition of the blastopore, the blastopore is derived from a portion of the blastopore just anterior to its hindermost end. The words "hindermost" and "anterior" are used on the assumption that the whole blastopore has retained its dorsal position; as a matter of fact the hindermost part of it is more or less ventralized, its position being that which in some other forms, the anus, i.e. the hind end of the blastopore, is at first contained within the medioual plate and bounded behind by the medullary folds. Later the portions of the medullary plate in the neighbourhood of the blastopore are cut out, and a slit-like opening, extending the hind end of the blastopore on to the ventral surface, and atrophy of the portion of the medullary plate in relation with it, is a highly important phenomenon, and one to which attention has been particularly directed in certain cases of the blastopore is being considered. The remarkable fact about the Vertebrata, a feature which that group shares in common with all other Chordata (Amphioxus, Tunicata, Enteropneusta) and with the Echinodermata, is that the mouth has never been traced into relation with the blastopore. For this reason, among others, it has been held by some zoologists that the mouth of the Vertebrata is not homologous with the mouth of such groups as the Annelida, Arthropoda and Mollusca. But, as has been explained above, in face of the extraordinary variability in the history of the mouth and anus in these groups, this view cannot be admitted in any way established. On the contrary, there are distinct reasons for thinking that the Vertebrate mouth and anus are derived out of the meso-branchial (Sedgwick, Quart. J. Mic. Sci. xxxiii., 1892, p. 559), and in a less conspicuous form in other vertebrate groups, the mouth has at first a slit-like form, extending from the anterior end of the so-called neural plate through the hindermost part of the anterior part of the embryo. This slit-like rudiment, recalling as it does the form which the blastopore assumes in so many groups and in many Vertebrata, does suggest the view that possibly the mouth of the Vertebrata may really be derived from a portion of an originally slit-like neural blastopore, which has become extended anteriorly on to the ventral surface and has lost its original relation to the nerve rudiment, as has undoubtedly happened with the posterior part, which persists as the anus.

Of the other organs which develop from the two primary layers it is only possible to notice here the central nervous system. This in almost all animals develops from the ectoderm. In Cephalopods among Mollusca—the development of which is remarkable from the almost complete absence of features which are supposed to have an ancestral significance—and in one or two other forms, it has been said to develop from the mesoderm; but apart from
EMBRYOLOGY

these exceptional and perhaps doubtful cases, the central nervous system of all embryos arises as thickenings of the ectoderm, and in the great invertebrates, namely, Annelida, Mollusca, Arthropoda, and Vertebrata, and probably others, from the ectoderm of the blastoporal surface of the body. This surface generally becomes the ventral surface, but in Vertebrata it becomes the dorsal. These thickened tracts of ectoderm in Peripatus and a few other forms can be clearly seen to surround the blastopore. This relation is retained in the adult in Peripatus, some Mollusca and some Nemertines, in which the main lateral nerve cords are united behind the anus as well as in front of the mouth; in other forms it cannot always be demonstrated, but it can, as in the case of the Vertebrata just referred to, always be inferred; only, in the Invertebrate groups the part of the nerve rudiment which has to be inferred is the posterior part behind the blastopore, whereas in Vertebrata it is the anterior part, namely, that in front of the blastopore, assuming that the mouth is a blastoporal derivative.

In the Echinodermata, Enteropneusta and one or two other groups, it is not possible in the absence of knowledge, to bring the mouth into relation with the blastopore, nor can the blastopore be shown to be a perforation of the neural surface. For the Echinoderms, at any rate, this fact loses some of the importance which might have been attributed to it, as a distinguishing character of the blastopore, by the arch of the adult and the sharp contrast which exists between it and the larva is remembered. In some Annelids the central nervous system remains throughout life as part of the outer epidermis, but as a general rule it becomes surrounded by mesodermal tissues. The mode in which this separation is effected varies according to the form and structure of the central nervous system. In the Vertebrata, in which this organ has the form of a tube extending along the dorsal surface of the body, it arises as a groove of the notochord, which becomes constricted into a canal. The wall of this canal consists of ectoderm, which at an earlier stage formed part of the outer surface of the body, but which after invagination thickens, to give rise to the lining of the neural channel, which thus forms the bulk of the canal wall. The fact that the blastopore remains open at the hind end of the neural plate explains to a certain extent the peculiar relation which always exists between the embryos of different species in the hind end of the neural and alimentary canals. This communication between the hind end of the neural tube and the gut is one of the most remarkable and constant features of Vertebrate embryos. As has been pointed out, it is not altogether unintelligible to suppose that the separation of the blastopore from the medullary plate of the earlier stage, but to give a complete explanation of it, is, and probably will always be, impossible. It is no doubt the impress of some remarkable larval condition of the blastopore of a stage of development long since passed.

In Ceratozoa the open part of the blastopore is enclosed by the medullary folds, as in Lepidostomi, and probably persists as an anus, the portion of the folds around the anus undergoing atrophy (Semon, Z. wiss. zool., vol. ii, p. 597). In some Cephalochordata, as Branchiostoma, the blastopore is said to persist as an anus so far as is known, but the relation to the medullary folds has not been noticed. The same may be said of Petromyzon (A. E. Shiehly, Quart. Journ. Mic. Sci., xxvii., 1897).

The nerve tube of the Vertebrata at a certain early stage of the embryo becomes bent ventrally in its anterior portion, in such a manner that the anterior end, which is represented in the adult by the infundibulum, is turned towards the head, and the posterior part, that to the tail. This is the cranial flexure. It is followed by a second flexure, which curves the junction of this part of the fore-brain with the part which is so largely developed, as the rudiment of the cerebrum, is marked by the attachment of the optic chiasma. The optic nerve, indeed, is morphologically the first cranial nerve, the olfactory being the second; both are attached to what is morphologically the dorsal side of the nerve tube. The morphological anterior end of the central nervous system is the point of the infundibulum which is in contact with the pituitary body. While on the subject of the cranial flexure, it may be pointed out that there is a similar downward curve which appears in the end of the neural tube, and in the end of the enteron. If it be supposed that originally there was a communication between the infundibulum and pituitary body, then the cranial flexure is not a separation, but a turning in the manner of the flexure of the rudiment of the cerebellum.

The early stages of development of the central nervous system are very much like that of the Vertebrata, but the later stages are simpler, being without the cranial flexure. The Tunicata are remarkable for the fact that the nervous system, although it shows all the features which belong to the central nervous system, is in part tubular, the canal being open at each end. It arises, however, by delamination from the ectoderm, the tube being a secondary acquisition. This is probably due to a shortening of development, for the same feature is found in some Vertebrata (Teleostei, Lepidosteus, &c.), where the central canal is secondarily hollowed out in the solid keel-like mass which is separated from the ectoderm. Parts of the central nervous system of the Tunicata, as the cephalic and vertebral ganglia of Dentalium are formed from the walls of two invaginations of ectoderm, which eventually disappear at the anterior end of the body (A. Kowalevsky, Ann. Mus. Hist. Nat. Moscou, vol. v. 1890, p. 348). In other Tunicata, however, these invaginations do not arise in a similar way, but in this case the cavities of the invagination become separated from the skin and persist as two hollow appendages on the lower side of the cerebral ganglia. In other Arbthropoda, the cerebral ganglia have been separated from the other parts of the invagination, and are thus in the adult in a similar position. In Nemertines the cerebral ganglia form a cavity which communicates with the exterior by a narrow canal. Finally, in certain Echinodermata the ventral part of the central nervous system arises by the invagination of a linear streak of ectoderm, the cavity of the invagination persisting as the epineural canal.

Although the central nervous system is almost always developed from the ectoderm of the embryo, the same cannot be said of the peripheral nerve trunks. These structures arise from the mesoblastic reticulum already described (Sedgwick, Quart. Journ. Mic. Sci., xxxiv., 1892). Insomuch as this reticulum is perfectly continuous with the precisely similar though denser tissue in the ectoderm and endoderm, it may be that a portion of the nerve trunks actually described as being ectodermal and endodermal in origin, though the bulk of them are undoubtedly formed from that portion of the reticulum commonly described as mesoblastic. But, however that may be, the tissue from which the great nerve trunks are developed is continuous on all sides with a similar tissue which pervades all the organs of the body, and in which the nuclei of these organs are contained.

In the early stages of development this tissue is very sparse and not easily seen. It would appear, indeed, that it is of a very delicate texture and readily destroyed by reagents. It is for this reason that the layers of the Vertebrate embryo are commonly represented as being quite isolated from one another, and that the medullary canal is nearly always represented as being completely isolated at certain stages from the surrounding tissues. In such well-marked cases as the carp, it forms a closed tube, consisting of a central canal connected together with many delicate laminae, which have been described by Kowalevsky (ibid.). In Peripatus, the nuclei are at first so densely crowded together that it is almost impossible to see the protoplasmic framework in which they rest, but as development proceeds this extracellular matter becomes separated from the nuclei, and the cell surfaces are thrown into numerous folds, which become so much pressed apart, so that it becomes visible and receives various names according to its position. In the wall of the medullary canal of the Peripatus embryo, on the outside of which it becomes especially continuous with the surface ectoderm, the extracellular matter of the developing nerve cord of the Peripatus embryo, it constitutes the white matter of the developing nerve cord; in the mesoblastic tissue outside, where it at the same time becomes more conspicuous (Sedgwick, "Memoir on the Development of the Amphioxus," Phil. Trans. Lab. of the University of Cambridge, iv., 1889, p. 131), it forms the looser network of the mesoblastic reticulum; and connecting the two, in place of the few and delicate strands of this tissue of the former stage, there are at certain places well-marked cords of a relatively dense tissue, with the meshes of the reticulum elongated.
in the direction of the cord. This latter structure is an incipient nerve trunk. It can be traced outwards into the mesoblastic reticulum, from the strands of which it is indeed developed, and with which it is continuous not only at its free end, but also along its whole length. The development of these latter features is due to the nerve cells gathering up, so to speak, of the fibres of the reticulum into bundles. These bundles are generally marked by the possession of nuclei, especially in their cortical parts, which become no doubt the nuclei of the mesodermal nerves, forming the extra-nuclear, so-called cellular, protoplasm of these layers. Moreover, it must be remarked that in the stages of the embryo with which we are here concerned the so-called cellular constitution of the tissues, which is so remarkable in the older embryo and adult, has not been arrived at. It is true, indications of it may be seen in some of the earlier-erained epithelia, but of nerve cells, muscular cells, and many kinds of gland cells no distinct signs are yet visible. This remark particularly applies to nerve cells, which do not make their appearance until a much later stage—not, indeed, until some time after the principal nerve trunks and ganglia are indicated as tracts of pale fibrous substance and aggregations of nuclei respectively.

Moreover—particularly of Scylium—are the best objects in which to study the development of nerves. In many embryos it is difficult to make out what happens, because the various parts of the body remain so close together that the processes are concealed. But in the lining epithelium of the mesoblastic nuclei is deferred until after the nerves have begun to be differentiated. The process may also be traced in the embryos of Peripatus, where the main features are essentially similar to those above described (e.g. Quart. Journ. Mic. Sci. xxiv., 1884). It is certain that the development of the motor nerves has been worked out in Lepidostrom by J. Graham Kerr (Trans. Roy. Soc. of Edinburgh, 41, 1904. p. 119).

To sum up, the development of nerves is not, as has been recently urged, an outgrowth of cell processes from certain cells, but is a differentiation of a substance which was already in position, and from which all other organs of the body have been and are developed. It frequently happens that the young nerve tracts can be seen sooner near the central organ than elsewhere, but it is doubtful if any connection can be attached to this fact, since it is not constantly observed. For instance, in the case of the third nerve of Scylium the differentiation appears to take place earliest near the ciliary ganglion, and to proceed from that point to the base of the mid-brain.

There are two main methods in which new organs are developed. In the one, which indicates the possibility of physiological continuity, the organ arises by the direct modification of a portion of a pre-existing organ; the development of the central nervous system of the Vertebrata from a groove in the embryonic ectoderm may be taken as an example of this method. In the other method there is no continuity which can be in any way interpreted as physiological; a centre of growth appears in one of the parts of the embryo, and gives rise to a mass of tissue which gradually shapes itself into the required organ. The development of the central nervous system in Teleostean and in other similar exceptional cases may be mentioned as an example of the second plan. Such a centre of growth is frequently called a blastema, and consists of a mass of closely packed nuclei which have arisen by the growth-activity of the nuclei in the neighbourhood. The coelom, an organ which is found in the so-called coelomate animals, and which in the adult is usually divided up more or less completely into three parts, namely, body-cavity, renal organs, generative glands, presents in different animals both these methods of development. In certain animals it develops by the direct modification of a part of the primitive enteron, while in others it arises by the gradual appearance, in a mass of tissue derived by nuclear proliferation from one or more of the pre-existing tissues of the body. Inasmuch as the first rudiment of the coelom nearly always makes its appearance at an early stage, when the ectoderm and endoderm are almost the only tissues present, and as it then bulks very large and frequently contains within itself the potential centres of growth of other organs, e.g. mesenchymal organs (see above), it has come to be regarded by embryologists as being the forerunner of all the so-called mesodermal organs of the body, and has been dignified with the somewhat mysterious rank which attaches to the conception of a germinal layer. Its prominence and importance at an early stage led embryologists, as has already been explained, to overlook the fact that although some of the centres of growth for the formation of other non-coelomic mesodermal organs and tissues may be contained within it, all are not so contained, and that there are centres of mesodermal growth still left in the ectoderm and endoderm after its establishment. If these considerations, and others like them, are correct, it would seem to follow that the conception implied by the word mesoderm has no objective existence, that the tissue of the embryo called mesoderm, though sometimes made the subject of reference, is not the tissue, but contains within itself the rudiment of many, sometimes of all, of the organs appertaining to the mesenchyme. In thus containing within itself the potential centres of growth of other organs and tissues which are commonly ranked as mesodermal, it is not different from the rudiments of the two other organs already formed, namely, the ectoderm and endoderm; for these contain within themselves centres of growth for the production of so-called mesodermal tissues, as witness the nerve-crest of Vertebrata, the growing-point of the pronephric duct, and the formation of blood-vessels from the hypoblast described for some members of the same group.

In Echinoderma, Amphioxus, Enteropneusta, and a few other groups, the coelom develops from a portion or portions of the primitive enteron, which eventually becomes separated from the rest and forms a variable number of closed sacs lying between the gut and the ectoderm. The number of these sacs varies in different animals, but the evidence at present available seems to show that the maximum number is five—an unpaired one in front and two pairs behind—and, further, that if a less number of sacs is actually separated from the enteron, the rule is for these sacs so to divide up that they give rise to five sacs arranged in the manner indicated. The Enteropneusta present us with the clearest case of the separation of five sacs from the primitive enteron (W. Bateson, Quart. Journ. Mic. Sci. xxiv., 1884). In Amphioxus, according to the important researches of E. W. MacBride (Quart. Journ. Mic. Sci. xli. 580), it appears that a similar process occurs, though it is complicated by the fact that the sacs of the posterior pair become divided up at an early stage into many pairs. In Phoronis there are indications of the same phenomenon (A. T. Masterman, Quart. Journ. Mic. Sci. xlii. 375). In the Chaetognatha a single sac only is separated from the enteron, but soon becomes divided up. In the Brachiopoda the pair of sacs is separated from the enteron, but our knowledge of their later history is not sufficient to enable us to say whether they divide up into the typically arranged five sacs. In Echinoderma the number of sacs separated from the enteron varies from one to three; but though the history of these shows considerable differences, there are reasons to believe that the typical final arrangement is one unpaired and two paired sacs. But however many sacs may arise from the primitive enteron, and however these sacs may ultimately divide up and arrange themselves, the important point of development common to all these animals, about which there can be no dispute, is that the coelom is a direct differentiation of a portion of the enteron.

In the majority of the Coelomata the coelomic rudiment does not arise by the simple differentiation of a pre-existing organ, and there is considerable variation in its method of formation. Speaking generally, it may be said to arise by the differentiation of a blastema (see above), which develops at an early stage as a nuclear proliferation from one or more growth-centres in one or both of the primary layers. It appears in this tissue as a sac or as a series of sacs, which become transformed into the body-cavity (except in the Arthropoda), into the renal organs (with the possible exception, again, of some Arthropoda), and into the reproductive glands. In metamERICally segmented animals the
appearance of the cavities of these sacs is synchronous with, and indeed determines, the appearance of metameric segmentation. In all segmented animals in which the mesoderm (coelomic rudiment) appears as a continuous sheet or band of tissue on every side of the body, the coelomic cavity makes its first appearance not as a continuous space on each side, which later becomes divided up into the structures called mesoblastic somites, but as a series of paired spaces round which the coelomic tissue安排s itself in an epithelial manner. In the Vertebrata, it is true, the ventral portion of the coelom appears at first as a continuous space, at any rate behind the region of the two anterior pairs of somites, but in the dorsal portion the coelomic cavity is developed in the usual way, the coelomic tissue becoming transformed into the muscle plates and rudimentary renal tubules of the later stages. With regard to this ventral portion of the coelom in Vertebrata, it is to be noticed that the cavity in it never becomes divided up, but always remains continuous, forming the perivisceral portion of the coelom. The probable explanation of this peculiarity in the development of the Vertebrata coelom, as compared with that of Amphioxus and other segmented animals, is that the segmented stage of the ventral portion occurs in the direction of the coelome the explanation that can be drawn from the fact that even in animals in which the coelom is at its first appearance wholly segmented, it frequently happens that in the adult the perivisceral portion of it is unsegmented, i.e., it loses during development the segmentation which it at first possesses. This happens in many Annelida and in Amphioxus. The lesson, then, which the early history of the coelom in segmented animals teaches is, that however the coelomic cavity first makes its appearance, whether by evaginations from the primitive enteron, or by the hollowing out of a solid blastema-like tissue which has developed from one or both of the primary layers, it is in its first origin segmented, and forms the basis on which the segments of the adult are moulded. In Arthropoda the origin of the coelom is similar to that of Annelids, but its history is not completely known in any group, with the exception of Peripatus. In this genus it develops no perivisceral portion, as in other groups, but gives rise solely to the nephridia and to the reproductive organs. It is probable, though not certainly proved, that the history of the coelom in other Arthropoda is essentially similar to that of Peripatus, allowance being made for the fact that the nephridial portion does not attain full development in those forms which are without nephridia in the adult.

With regard to the development of the vascular system, little can be said here, except that it appears to arise from the spaces of the mesoblastic reticulum. When this reticulum is sparse or so delicate as to give way in manipulation, these spaces appear to be represented by a continuous space which in the earliest stages of development is frequently spoken of as the blastocoele or segmentation cavity. They acquire special epithelial walls, and form the main trunks and network of smaller vessels found in animals with a canalicular vascular system, or the large sinus-like spaces characteristic of animals with a haemoceolic body-cavity.

The existence of a phase at the beginning of life during which a young animal acquires its equipment by a process of growth of the germ is of course intelligible enough; such a phase is seen in the formation of buds, and in the sexual reproduction of both animals and plants. The remarkable point is that while in most cases this embryonic growth is a direct and simple process—e.g., animal and plant buds, embryonic development of plant seeds—in many cases of sexual reproduction of animals it is not direct, and the embryonic phase shows stages of structure which seem to possess a meaning other than that of being merely phases of growth. The fact that these stages of structure through which the embryo passes sometimes present for a short time features which are permanent in other members of the same group, adds very largely to the interest of the phenomenon and necessitates its careful examination. This may be divided into two heads: (1) in relation to embryos, (2) in relation to larvae. So far as embryos are concerned, we shall limit ourselves mainly to a consideration of the Vertebrata, because in them are found most instances of that remarkable phenomenon, the temporary assumption by certain organs of the embryo of stages of structure which are permanent in other members of the same group. As is well known, the embryos of the higher Vertebrata possess in the structure of the pharynx and of the heart and vascular system certain features—namely, paired pharyngeal apertures, a simple tubular heart, and a single ventral aorta giving off right and left a number of branches which pass between the pharyngeal apertures—which permanently characterize those organs in fishes. The skeleton, largely bony in the adult, passes through a stage in which it is entirely without bone, and consists mainly of cartilage—"the form which it permanently possesses in certain fishes. Further, the Vertebrate embryo possesses for a time a notochord, a segmented muscular system, a continuity between the pericardium and the posterior part of the perivisceral cavity—all features which characterize certain groups of Pisces in the adult state. Instances of this kind might be multiplied, for the work of anatomists and embryologists has of late years been largely devoted to adding to the simple embryonic characters which are not found in the adults of other Vertebrates are the following:—At a certain stage of development the central nervous system has the form of a groove in the skin, there is a communication at the hind end of the body between the neural and alimentary canals, the mouth aperture has at first the form of an elongated slit, the growing end of the Wolffian duct is in some groups continuous with the ectoderm, and the retina is at one stage a portion of the wall of the medullary canal. In the embryos of the lower Vertebrates many other instances of the same interesting character might be mentioned; for instance, the presence of a coelomic sac close to the eye, of another in the jaw, and of a third near the ear (Elasmobranchs), the opening of the Müllerian duct into the front end of the Wolffian duct, and the presence of an aperture of communication between the muscle-plate coelom and the nephridial coelom.

The interest attaching to these remarkable facts is much increased by the explanation which has been given of them. That explanation, which is based on the assumption of recapitulation of evolution, is to the effect that the peculiar embryonic structures and relations just mentioned are due to the retention by the embryo of features which, once possessed by the adult ancestor, have been lost in the course of evolution. This explanation, which at once suggests itself when we are dealing with structures actually present in adult members of other groups, does not so obviously apply to those features which are found in no adult animal whatsoever. Nevertheless it has been extended to them, because they are of a nature which it is not impossible to suppose might have existed in a working animal. Now this explanation, which, it will be observed, can only be entertained on the assumption that the evolution theory is true, has been still further extended by embryologists in a remarkable and frequently unjustifiable manner, and has been applied to all embryonic processes, finally leading to the so-called recapitulation theory, which asserts that embryonic history is a shortened recapitulation of ancestral history, or, to use the language of modern zoology, that the ontogeny or development of the individual contains and abbreviated record of the phylogeny or development of the race. A theory so important and far-reaching as this requires very careful examination. When we come to look for the facts upon which it is based, we find that they are non-existent, for the ancestors of all living animals are dead, and we have no means of knowing what they were like. It is true there are fossil remains of animals which have lived, but these are so imperfect as to be practically useless for the present requirements. Moreover, if they were perfectly preserved, there would be no evidence to show that they were ancestors of the animals now living. They might have been animals which have become extinct and left no descendants. Thus the explanation ordinarily given of the embryonic structures referred to is purely a deduction from the evolution theory. Indeed, it is even less than this, for all that can be said is
something of this kind: if the evolution theory is true, then it is conceivable that the reason why the embryo of a bird passes through a stage in which its pharynx presents some resemblance to that of a fish is that a remote ancestor of the bird possessed a pharynx with lateral apertures such as are at present found in fishes.

But the explanation is sometimes pushed even further, and it is said that these pharyngeal apertures of the ancestral bird had the same respiratory function as the corresponding structures in modern fishes. That this is going too far a little reflection will show. For if it be admitted that all so-called vestigial structures had once the same function as the homologous structures when fully developed in other animals, it becomes necessary to admit that male mammals must once have had fully developed mammary glands and suckled the young, that female mammals formerly were provided with a functional penis, and that in species in which the females have a trace of the secondary sexual characters of the male the latter were once common to both sexes. The second and more extended form of the explanation plainly introduces a considerable amount of contentious matter, and it will be advisable, in the first instance, at any rate, to confine ourselves to the embryo and the animal human-like. This explanation obviously implies the view that in the course of evolution the tendency has been for structures to persist in the embryo after they have been lost in the adult. Is there any justification for this view? It is clearly impossible to get any direct evidence, because, as explained above, we have no knowledge of the ancestors of living animals; but if we assume the evolution theory to be true, there is a certain amount of indirect evidence which is distinctly opposed to the view. As is well known, living birds are without teeth, but it is generally assumed that their edentulous condition has been comparatively recently acquired, and that they are descended from animals which, at a time not very remote from the present, possessed teeth. Considering the resemblance of birds to other terrestrial vertebrates, and the fact that extinct birds, not greatly differing from birds now living, are known to have had teeth, it must be allowed that there is some warrant for the assumption. Yet in no single case has it been certainly shown that any trace of teeth has been developed in the embryo. The same remark applies to a large number of other cases; for instance, the reduced digits of the bird's hand and foot are lost in the adult. Moreover, organs which are supposed to have become recently reduced and functionless in the adult are also reduced in the embryo; for instance, digits 3 and 4 of the horse's foot, the hind limbs of whales (G. A. Girdberg and F. Nansen, "On the Development and Structure of Whales," Bergen Museum, 1884), the spiracle of Elasmobranchii. In fact, considerations of this kind distinctly point to the view that any tendency to the reduction or enlargement of an organ in the adult is shared approximately to the same extent by the embryo. But there are undoubtedly some, though not many, cases in which organs which were presumably present in an ancestral adult have persisted in the embryo of the modern form. As an instance may be mentioned the presence in whale-bone whales of imperfectly formed teeth, which are absorbed comparatively early in foetal life (Julin, Arch. biologie, i, 1886, p. 75).

It therefore becomes necessary to inquire why in some cases an organ is retained by the embryo after its loss by the adult, whereas in other cases it dwindles and presumably disappears simultaneously in both the female and the male. This question is explained and discussed by the present writer in the Quarterly Journal of Microscopical Science, xxxvi., 1894, p. 35, and the conclusions there reached are as follows:—A disappearing adult organ is not retained in a relatively greater development by an organism in the earlier stages of its individual growth unless it is of functional importance to the young form. In cases in which the whole development is embryonic this rarely happens, because the conditions of embryonic life are so different from free life that functional embryonic organs are usually organs sui generis, e.g. the placenta, amnion, &c., which cannot be traced to a modification of organs previously present in the adult. It does, however, appear to have happened sometimes, and as an instance of it may be mentioned the ductus arteriosus of the Sauropodan and Mammalian embryo. On the other hand, when there is a considerable period of larval life, it does appear that there is a strong case for thinking that organs which have been lost by the adult may be retained and made use of by the larva. The best-known example that can be given of this is the tadpole of the frog. Here we find organs, viz. gills and gill-slits, which are universally regarded as having been attributes of all terrestrial Vertebrata in an earlier and aquatic condition, and we also notice that their retention is due to their being useful on account of the supposed ancient conditions of life having been retained. Many other instances, more or less plausible, of a like retention of ancestral features by larvae might be mentioned, and it must be conceded that there are strong reasons for supposing that larvae often retain traces, more or less complete, of ancestral stages of structure. But this admission does not carry with it any obligation to accept the widely prevalent view that larval history can in any way be regarded as a recapitulation of ancestral history. Far from it, for larvae in retaining some ancestral features are in no way different from adults in retaining some larval features which they have retained. Both larvae and adults retain ancestral features, and both have been modified by an adaptation to their respective conditions of life which has ever been becoming more perfect.

The conclusion, then, has been reached, that whereas larvae frequently retain traces of ancestral stages of adult structure, embryos will rarely do so; and we are confronted again with the question, How are we to account for the presence in the embryo of numerous functionless organs which cannot be explained otherwise than as having been inherited from a previous condition in which they were functional? The answer is that the only organs of this kind which have been retained are organs which have been retained by the larvae of the ancestors after they have been lost by the adult, and have become in this way impressed upon the development. As an illustration taken from current natural history of the manner in which larval characters are in actual process of becoming embryonic may be mentioned the case of the viviparous salamander (Salamander atra), in which the gills, &c., are all developed but never used, the animal becoming a terrestrial adult. We thus get certain aspects of the salamander there is a considerable period of larval life in which the gill and gill-slits are functional, but in this species the larval stage, for the existence of which there was a distinct reason, viz. the entirely aquatic habits of life in the young state, has become at one stroke embryonic by its simple absorption into the embryonic period. The view, then, that embryonic development is essentially a recapitulation of ancestral history must be given up; it contains only a few references to ancestral history, namely, those which have been preserved probably in a much modified form by previous larvae.

We must now pass to the consideration of another supposed law of embryology—the so-called law of v. Baer. This generalization is usually stated as follows:—Embryos of different species of the same group are more alike than adults, and the resemblances are greater the younger the embryo examined. Great importance has been attached to this generalization by embryologists and naturalists, and it is very widely accepted. Nevertheless, it is open to serious criticism. If it were true, we should expect to find that the embryos of similar species would be indistinguishable, but this is notoriously not the case. On the contrary, they often differ more than do the adults, in support of which statement the embryos of the different species of Peripatus may be referred to. The generalization undoubtedly had its origin in the fact that there is what may be called a family resemblance between embryos, but this resemblance, which is by no means exact, is purely superficial, and does not extend to anatomical detail. On the contrary, it may be fairly argued that in some cases embryos of widely dissimilar members of the same group present anatomical differences of a higher morphological value than do the adults (see Sedgwick, loc. cit.), and, as stated above the
embryos of closely allied animals are distinguishable at all stages of development, though the distinguishing features are not the same in all, which distinguish the adults. To say that the development of the organism and of its component parts is a progress from the simple to the complex is to state a truism, but to state that it is also a progress from the general to the special is to go altogether beyond the facts. The bipinnaed larva of an echinoderm, the trochosphere larva of an annelid, the blastodermic vesicle of a mammal are all as highly specialized as their respective adults, but the specialization is for a different purpose, and of a different kind to that which characterizes the adult.

In its scientific and systematic form embryology may be considered as having only taken birth within the last century, although the germ from which it sprang was already formed nearly half a century earlier. The ancients, it is true, as we see by the writings of Aristotle and Galen, pursued the subject with interest, and the indefatigable Greek naturalist and philosopher had even made continued series of observations on the progressive stages of development in the products of the various animals; but although, after the revival of learning, various anatomists and physiologists from time to time made contributions to the knowledge of the foetal structure in its larger organs, yet from the minuteness of the observations required for embryological research, it was not till the microscope came into use for the investigation of organic structure that any intimate knowledge was attained of the nature of organogenesis. It is not to be wondered at, therefore, that during a long period, in this as in other branches of physical inquiry, vague speculations took the place of direct observation and more solid information. This is apparent in most of the works treating of generation during the 16th and part of the 17th centuries.

Harvey was the first to give, in the middle of the latter century, a new life and direction to investigation of this subject, by his discovery of the connexion between the cicatricula of the yolk and the rudiments of the chick, and by his faithful description of the successive stages of development as observed in the incubated egg, as well as of the progress of gestation in some Mammalia. He had also the merit of fixing the attention of physiologists upon general laws of development as deduced from actual observation of the phenomena, by the enunciation of two important propositions, viz.—(1) that all animals are produced out of ova, and (2) that the organs of the embryo arise by new formation, or *epigenesis*, and not by mere enlargement out of a pre-existing invisible condition (*Exercitationes de generatione animalium*, Amsterdam, 1651). Harvey’s observations, however, were aided only by the use of magnifying glasses (perspectaculis), probably of no great power, and he saw nothing of the earliest appearances of the embryo in the first thirty-six hours, and believed the blood and the heart to be the parts first formed.

The influence of the work of Harvey, and of the successful application of the microscope to embryological investigation, was soon afterwards apparent in the admirable researches of Malpighi of Bologna, as evinced by his communications to the Royal Society of London in 1672, “De ovo incubato,” and “De formatione pulli,” and more especially in his delineations of some of the earlier phenomena of development, in which, as in many other parts of minute anatomy, he partially or wholly anticipated discoveries, the full development of which has only been accomplished in the present century. Malpighi traced the origin of the embryo almost to its very commencement in the formation of the cerebro-spinal groove within the cicatricula, which he removed from the opaque mass of the yolk; and he only erred in supposing the embryonal rudiments to have previously existed as such in the egg, in consequence, apparently, of his having employed for observation, in very warm weather, eggs which, though he believed them to be unincubated, had in reality undergone some of the earlier developmental changes.

The works of Walter Needham (1667), Regnier de Graaf (1673), Swammerdam (1683), Vallisneri (1689)—following upon those of Harvey—all contain important contributions to the knowledge of our subject, as tending to show the similarity in the mode of reproduction from ovum in a variety of animals with that previously best known in birds. The observations more especially of de Graaf, Nicolas Steno, and J. van Horne gave much greater evidence of the close connexion between the origin of the ovum of quadrupeds and the zygote of birds, a connexion now termed Graafian, which de Graaf showed always burst and discharged its contents on the occurrence of pregnancy.

These observations bring us to the period of Boerhaave and Albinus in the earlier part of the 18th century, and in the succeeding years to that of Haller, whose vast erudition and varied and accurate original observations threw light upon the entire process of reproduction in animals, and brought its history into a more systematic and intelligible form. A considerable part of the seventh and the whole of the eighth volumes of Haller’s great work, *Elementa physiologiae*, published at successive times from 1757 to 1766, are occupied with the general view of the function of generation, while his special contributions to embryology are contained in his *Deux mémoires sur la formation du cœur dans le poulet et Deux mémoires sur la formation des os*, both published at Lausanne in 1758, and republished in an extended and altered form, together with his “Observations on the early condition of the Embryo in Quadrupeds,” made along with Kühlemann, in the *Opera magna* (1762–66). Though originally educated as a believer in the doctrine of “epigenesis” by his teacher Boerhaave, Haller was soon led to abandon that view in favour of “epigenesis” or new formation, as may be seen in various parts of his works published before the middle of the century; see especially a long note explanatory of the grounds of his change of opinion in his edition of Boerhaave’s *Prælectiones academicae*, vol. v. part 2, p. 497 (1744), and his *Prima lineae physiologiae* (1747). But some years later, and after having been engaged in observing the phenomena of development in the incubated egg, he again changed his views, and during the remainder of his life was a keen opponent of the system of epigenesis, and a defender and exponent of the theory of “evolution,” as it was then named—a theory very different from that now bearing the name, and which implied belief in the pre-existence of the organs of the embryo in the germ, according to the theory of encasement (embolement) or inclusion supported by Leibnitz and Bonnet. (See the interesting work of Bonnet, *Considérations sur les corps organisés*, Amsterdam, 1762, for an account of his own views and those of Haller.)

It was reserved for Caspar Frederic Wolff (1733–1794), a German by birth, but naturalized afterwards in Russia, to bring forward observations which, though almost entirely neglected for a long time after their publication, and in some measure discredited under the influence of Haller’s authority, were sixty years later acknowledged to have established the theory of epigenesis upon the secure basis of ascertained facts, and to have laid the first foundation of the morphological science of embryology. Wolff’s work, entitled *Theoria generationis*, first published as an inaugural Dissertation at Berlin in 1759, was republished with additions in German at Berlin in 1764, and again in Latin at Halle in 1774. Wolff also wrote a *Memoir on
the Development of the Intestine" in *Nov. comment. acad. Petrop.*, 1768 and 1769. But it was not till the latter work was translated into German by J. F. Meckel, and appeared in his *Archiv* for 1812, that Wolff's peculiar merits as the founder of modern embryology came to be known or fully appreciated.

The special novelty of Wolff's discoveries consisted mainly in this, that he showed that the germinal part of the bird's egg forms a layer of united granules or organized particles (cells of the modern histologist), presenting at first no semblance of the form or structure of the future embryo, but gradually converted by various morphological changes in the formative material, which are all capable of being traced by observation, into the several rudimentary organs and systems of the embryo. The earlier form of the embryo he delineated with accuracy; the actual mode of formation he traced in more than one organ, as for example in the alimentary canal, and he was the discoverer of several new and important embryological facts, as in the instance of the primordial kidneys, which have thus been named the Wolffian bodies. Wolff further showed that the growing parts of plants owe their origin to organized particles or cells, so that he was led to the great generalization that the processes of embryonic formation and of adult growth and nutrition are all of a like nature in both plants and animals. No advance, however, was made upon the basis of Wolff's discoveries till the year 1817, when the researches of C. H. Pander on the development of the chick gave a fuller and more exact view of the phenomena less clearly indicated by Wolff, and laid down with greater precision a plan of the formation of parts in the embryo of birds, which may be regarded as the foundation of the views of all subsequent embryologists.

But although the minute investigation of the nature and true theory of the process of embryonic development was thus held in abeyance for more than half a century, the interval was not unproductive of observations having an important bearing on the knowledge of the anatomy of the foetus and the function of reproduction. The great work of William Hunter on the human gravid uterus, containing unequalled pictorial illustrations of its subject from the pencil of Rymsdylk and other artists, was published in 1775; and during a large part of the same period numerous communications to the *Memoirs* of the Royal Society testified to the activity and genius of his brother, John Hunter, in the investigation of various parts of comparative embryology. But it is mainly in his rich museum, and in the manuscripts and drawings which he left, and which have been in part described and published in the catalogue of his wonderful collection, that we obtain any adequate idea of the unexampled industry and wide scope of research of that great anatomist and physiologist.

As belonging to a somewhat later period, but still before the time when the more strict investigation of embryological phenomena was resumed by Pander, there fall to be noticed, as indicative of the rapid progress that was making, the experiments of L. Spallanzani, 1789; the researches of J. H. von Autenrieth, 1797, and of Soemmering, 1799, on the human foetus; the observations of Senff on the formation of the skeleton, 1801; those of L. Oken and D. G. Kieser on the intestine and other organs, 1806; Oken's remarkable work on the bones of the head, 1807 (with the views promulgated in which Goethe's name is also intimately connected); J. F. Meckel's numerous and valuable contributions to embryology and comparative anatomy, extending over a long series of years; and F. Tiedemann's classical work on the development of the brain, 1816.

The observations of the Russian naturalist, Christian Heinrich Pander (1794–1863), were made at the instance and under the immediate supervision of Prof. Döllinger at Würzburg, and we learn from von Baer's autobiography that he, being an early friend of Pander's, and knowing his qualifications for the task, had pointed him out to Döllinger as well fitted to carry out the investigation of development which that professor was desirous of having accomplished. Pander's inaugural dissertation was entitled *Histoire metamorphoses quasi ovaee incubatuum priorius quinaque diebus subit* (Vircseburg, 1817); and it was also published in German under the title of *Beiträge zur Entwicklungsgeschichte des Hühnchens im Eie* (Würzburg, 1817). The beautiful plates illustrating the latter work were executed by the elder E. J. d'Alton, well known for his skill in scientific observation, delineation and engraving.

Pander observed the germinal membrane or blastoderm, as he for the first time called it, of the fowl's egg to acquire three layers of organized substance in the earlier period of incubation. These he named respectively the serous or outer, the vascular or middle, and the mucous or inner layers; and he traced with great skill and care the origin of the principal rudimentary organs and systems from each of these layers, pointing out shortly, but much more distinctly than Wolff had done, the actual nature of the changes occurring in the process of development.

Karl Ernest von Baer (p. v.), the greatest of modern embryologists, was, as already remarked, the early friend of Pander, and, at the time when the latter was engaged in his researches at Würzburg, was associated with Döllinger as prosecutor, and engaged with him in the study of comparative anatomy. He witnessed, therefore, though he did not actually take part in, Pander's researches; and the latter having afterwards abandoned the inquiry, von Baer took it up for himself in the year 1819, when he had obtained an appointment in the university of Königsberg, where he was the colleague of Burdach and Rathke, both of whom were able coadutors in the investigation of the subject of his choice. (See v. Baer's interesting autobiography, published on his retirement from St Petersburg to Dorpat in 1864.)

Von Baer's observations were carried on at various times from 1819 to 1826 and 1827, when he published the first results in a description of the development of the chick in the first edition of Burdach's *Physiologie*.

It was at this time that von Baer made the important discovery of the ovarian ovum of mammals and of man, totally unknown before his time, and was thus able to prove as matter of exact observation what had only been surmised previously, viz. the entire similarity in the mode of origin of these animals with others lower in the scale. (*Epistola de ovi mammalium et hominis geniss, Lipsiae, 1827. See also the interesting commentary or on supplement to the Epistola in Heusinger's *Journal*, and the translation in Bresch's *Répertoire, Paris, 1829.*).

In 1849 von Baer published the first part of his great work, entitled *Beobachtungen und Reflexionen über die Entwicklungs geschichte der Thiere*, the second part of which, still leaving the work incomplete, did not appear till 1838. In this work, distinguished by the fulness, richness and extreme accuracy of the observations and descriptions, as well as by the breadth and soundness of the general views on embryology and allied branches of biology which it presents, he gave a detailed account not only of the whole progress of development of the chick as observed day by day during the incubation of the egg, but he also described what was known, and what he himself had investigated by numerous and varied observations, of the whole course of formation of the young in other vertebrate animals. His work is in fact a system of comparative embryology, replete with new discoveries in almost every part.

Von Baer's account of the layers of the blastoderm differs somewhat from that of Pander, and appears to be more consistent with the further researches which have lately been made than was at one time supposed, in this respect, that he distinguished from a very early period two primitive or fundamental layers, viz. the animal or upper, and the vegetative or lower, from each of which, in connexion with two intermediate layers derived from them, the fundamental organs and systems of the embryo are derived—the animal layer, with its derivative, supplying the dermal, neural, osseous and muscular; the vegetative layer, with its derivative, the vascular and mucous (intestinal) systems. He laid down the general morphological
principle that the fundamental organs have essentially the shape of tubular cavities, as appears in the first form of the central organ of the nervous system, in the two muscular and osseous tubes which form the walls of the body, and in the intestinal canal; and he followed out with admirable clearness the steps by which from these fundamental systems the other organs arise secondarily, such as the organs of sense, the glands, lungs, heart, vascular glands, Wolfinian bodies, kidneys and generative organs.

To complete von Baer’s system there was mainly wanting a more minute knowledge of the intimate structure of the elementary tissues, but this had not yet been acquired by biologists, and it remained for Theodor Schwann of Liége in 1839, along with whom should be mentioned those who, like Robert Brown and M. J. Schleiden, prepared the way for his great discovery, to point out the uniformity in histological structure of the simpler forms of plants and animals, the nature of the organized animal and vegetable cell, the cellular constitution of the primitive ovum of animals, and the derivation of the various tissues, complex as well as simple, from the transformation or, as it is now called, differentiation of simple cellular elements—discovery which has exercised a powerful and lasting influence on the whole progress of biological knowledge in our time, and have contributed in an eminent degree to promote the advance of embryology itself.

To K. B. Reichert of Berlin more particularly is due the first application of the newer histological views to the explanation of the phenomena of development, 1840. To him and to R. A. von Kölliker and R. Virchow is due the ascertainment of the general principle that there is no free-cell formation in embryonic development and growth, but that all organs are derived from the multiplication, combination and transformation of cells, and that all cells giving rise to organs are the descendants or progeny of previously existing cells, and that these may be traced back to the original cell or cell-substance of the ovum.

It may be that modern research has somewhat modified the views taken by biologists of the statements of Schwann as to the constitution of the organized cell, especially as regards its simplest or most elementary form, and has increased more exactly the nature of the protoplasmic material which constitutes its living basis; but it has not caused any very wide departure from the general principles enunciated by that physiologist. Schwann’s treatise, entitled *Microscopical Researches into the Accordance in the Structure and Growth of Animals and Plants,* was published in German at Berlin in 1839, and was translated into English by Henry Smith, and printed for the Sydenham Society in 1847, along with a translation of Schleiden’s memoir, “Contributions to Phylogensis,” which originally appeared in 1838 in Müller’s *Archiv* for that year, and which had also been published in English in Taylor and Francis’s *Scientific Memoirs,* vol. ii. part vi.

Among the newer observations of the same period which contributed to a more exact knowledge of the structure of the ovum itself may be mentioned—first the discovery of the germinal vesicle, or nucleus, in the germ-disk of birds by J. E. von Purkinje (*Symbolae ad ovum avium historiam ante incubationem* Leipzig, 1831; and again at Leipzig in 1836); second, von Baer’s discovery of the mammiferous ovum in 1827, already referred to; third, the discovery of the germinal vesicle of mammals by J. V. Coste in 1834, and its independent observation by Wharton Jones in 1835; and fourth, the observation in the same year by Rudolph Wagner of the germinal macula or nucel. Coste’s discovery of the germinal vesicle of Mammalia was first communicated to the public in the *Comptes rendus* of the French Academy for 1833, and was more fully described in the *Recherches sur la génération des mammifères,* by Delpech and Coste (Paris, 1834). Thomas Wharton Jones’s observations, made in the autumn of 1834, without a knowledge of Coste’s communication, were presented to the Royal Society in 1835. This discovery was also confirmed and extended by G. G. Valentin and Bernard, as recorded by the latter in his work *Symb. ad ovum mamm. hist. ante praegnationem.* Rudolph Wagner’s observations first appeared in his *Textbook of Comparative Anatomy,* published at Leipzig in 1834–1835, and in Müller’s *Archiv* for the latter year. His more extended researches are described in his work *Prodromus hist. generat. hominis aegte animalium* (Leipzig, 1836), and in a memoir inserted in the *Trans. of the Roy. Bavarian Acad. of Sciences* (Munich, 1837).

The two decades of years from 1820 to 1840 were peculiarly fertile in contributions to the anatomy of the foetus and the progress of embryological knowledge. The researches of Prévost and Dumas on the ova and primary stages of development of Batrachia, birds and mammals, made as early as 1824, deserve especial notice as important steps in advance, both in the discovery of the process of yolk segmentation in the batrachian ovum, and in their having shown almost with the force of demonstration, previous to the discovery of the mammiferous ovarian ovum by von Baer, that that body must exist as a minute spherule in the Graafian follicle of the ovary, although they did not actually succeed in bringing the ova clearly under observation.

The works of Pockels (1825), of Seiler (1831), of G. Breschet (1833), of A. A. L. M. Velpeau (1833), of T. L. W. Bischoff (1834)—all bearing upon human embryology; the researches of Coste in comparative embryology in 1834, already referred to, and those published by the same author in 1837; the publication of Johannes Müller’s great work on physiology, and Rudolph Wagner’s smaller text-book, in both of which the subject of embryology received a very full treatment, together with the excellent *Manual of the Development of the Foetus,* by Valentin, in 1835, the first separate and systematic work on the whole subject, now secured to embryology its permanent place among the biological sciences on the Continent; while in this country attention was drawn to the subject by the memoirs of Allen Thomson (1831), Th. Wharton Jones (1835–1838) and Martin Barry (1839–1840).

Among the more remarkable special discoveries which belong to the period now referred to, a few may be mentioned, as, for example, that of the chorda dorsalis by von Baer, a most important one, which may be regarded as the key to the whole of embryological morphology: the phenomenon of yolk segmentation, now known to be universal among animals, but which was only first carefully observed in Batrachia by Prévost and Dumas (though previously casually noticed by Swammerdam), and was soon afterwards followed out by Rusconi and von Baer in fishes; the discovery of the branchial clefts, plates and vascular arches in the embryos of the higher abranchiate animals by H. Rathke in 1825–1827; the able investigation of the transformations of these arches by Reichert in 1837; and the researches on the origin and development of the urinæry and generative organs by Johannes Müller in 1829–1830.

On entering the fifth decade of the 19th century, the number of original contributions and systematic treatises becomes so great as to render the attempt to enumerate even a selection of the more important of them quite unsuitable to the limits of the present article. We must be satisfied, therefore, with a reference to one or two which seem to stand out with greater prominence than the rest as landmarks in the progress of embryological knowledge. Among these may most be mentioned the researches of Theodor L. W. von Bischoff, formerly of Giessen and later of Munich, on the development of the ovum in Mammalia, in which a series of the most laborious, minute and accurate observations furnished a greatly novel and very full history of the formative process in several animals of that class. These researches are contained in four memoirs, treating separately of the development of the rabbit, the dog, the guinea-pig and the roe-deer, and appeared in succession in the years 1842, 1845, 1852 and 1854. Next may be mentioned the great work of Coste, entitled *Histoire gén. et particul. du développement des animaux,* of which, however, only four fasciculi appeared between the years 1847 and 1850, leaving the work incomplete. In this work, in the large folio form, beautiful representations are given of the author’s valuable observations on human embryology, and on that of various mammals, birds and fishes, and of the author's
discovery in 1847 of the process of partial yolk segmentation in the germinal disk of the fowl’s egg during its descent through the oviduct, and his observations on the same phenomenon in fishes and mammals.

The development of reptiles received important elucidation from the researches of Rathke, in his history of the development of serpents, published at Königsberg in 1839, and in a similar work on the turtle in 1848, as well as in a later one on the crocodile in 1866, along with which may be associated the observations of H. J. Clark on the "Embryology of the Turtle," published in Agassiz’s Contributions to Natural History, &c., 1857.

The phenomena of yolk segmentation, to which reference has more than once been made, and to which later researches give more and more importance in connexion with the fundamental phenomena of development, received great elucidation during this period, first from the observations of C. T. E. von Siebold and those of Bagge on the oogenesis of the egg in nematoid worms in 1843, and more fully by the observations of Kölliker in the same animals in 1843. The nature of partial segmentation of the yolk was first made known by Kölliker in his work on the development of the Cephalopoda in 1844, and, as has already been mentioned, the phenomena were observed by Coste in the eggs of birds. The latter observations have since been confirmed by those of Oellicher, Götze and Kölliker. Further researches in a vast number of animals give every reason to believe that the phenomenon of segmentation is in some shape or other the invariable precursor of embryonic formation.

The first considerable work on the development of a division of the invertebrates was that of Maurice Herold of Marburg on spiders, De generatione araneorum ex ovo, published at Marburg in 1824, in which the whole phenomena of the formative processes in that animal are described with remarkable clearness and completeness. A few years later an important series of contributions to the history of the development of invertebrate animals appeared in the second volume of Burdach’s work on Physiology, in which the first edition was published in 1828, and in this the history of the development of the Entozoa was the production of Ch. Theod. von Siebold, and that of most of the other invertebrates was compiled by H. Rathke from the results of his own observations and those of others. These memoirs, together with others subsequently published by Rathke, notably Über die Bildung und Entwicklungsgeschichte der Flusskrebses (Leipzig, 1829), in which an attempt is made to extend the doctrine of the derivation of the organs from the germinal layers to the invertebrate, entitle him to be regarded as the founder of invertebrate embryology.

A large body of facts having by this time been ascertained with respect to the more obvious processes of development, a further attempt to refine the phenomena of embryogenesis to morphological and histological principles became desirable. More especially was the need felt to point out with greater minuteness and accuracy the relation in which the origin of the fundamental organs of the embryo stands to the layers of the blastoderm; and this we find accomplished with signal success in the researches of R. Remak on the development of the chick and frog, published between the years 1850 and 1855.

Starting from Pander’s discovery of the trilaminar blastoderm, Remak worked out the development of the chick in the light of the cell-theory of Schleiden and Schwann. He observed the division of the middle layer into two by a split which subsequently gives rise to the body-cavity (pleuro-peritoneal space) of the adult; and traced the principal organs which came from these two layers (Hautfaserblatt and Darmfaserblatt) respectively. In this manner the foundations of the germ-layer theory were established in their modern form.

A great step forward was made in 1859 by T. H. Huxley, who observed the serous and mucous layers of Pander with the ectoderm and endoderm of the Coelenterata. But in spite of this comparison it was generally held that germinal layers similar to those of the vertebrate were not found in invertebrate animals, and it was not until the publication in 1871 of Kowalewsky’s researches (see below) that the germinal layer theory was applied to the embryos of all the Metazoa. But the year 1859 will be for ever memorable in the history of science as the year of the publication of the Origin of Species. If the enunciation of the cell-theory may be said to have marked a first from a second period in the history of embryology, the publication of Darwin’s great idea ushered in a third. Whereas hitherto the facts of anatomy and development were loosely held together by the theory of types which owed its origin and maintenance to Cuvier, L. Agassiz, J. Müller and R. Owen, they were now combined into one organic whole by the theory of descent and by the hypothesis of recapitulation which was deduced from that theory. First clearly enunciated by Johann Müller in his well-known work Für Darwin published in 1864 (rendered in England as Facts for Darwin, 1869), the view that a knowledge of embryonic and larval histories would lay bare the secrets of race history and enable the course of evolution to be traced and lead to the discovery of the natural system of classification, gave a powerful stimulus to embryological research. The first fruits of this impetus were gathered by Alexander Agassiz, A. Kowalewsky and E. Metschnikoff. Agassiz, in his memoir on the Embryology of the Starfish published in 1864, showed that the body-cavity in Echinodermata arises as a differentiation of the enteron of the larva and so laid the foundations of our present knowledge of the coelom. This discovery was confirmed in 1869 by Metschnikoff (“Studien üb. d. Entwickl. d. Echinodermen u. Nemertinen,” Mém. Ac. Pétersbourg (7), 41, 1869), and extended by him to Tornaria, the larva of Balanoglossus in 1870 (“Untersuchungen ü. d. Metamorphose einiger Seethiere,” Z. f. wiss. Zoologie, 20, 1870). In 1871 Kowalewsky in his classical memoir, entitled “Embryologische Studien an Würmern und Arthropoden” (Mém. Acad. Pétersbourg (7), 16, 1871), proved the same fact for Sagitta and added immensely to our knowledge of the history of development of the Invertebrata.

These memoirs formed the basis on which subsequent workers took their stand. Amongst the most important of these was F. M. Balfour (1851–1882). Led to the study of embryology by his teacher, M. Foster, in association with whom he published in 1874 the Elements of Embryology, Balfour was one of the first to take advantage of the facilities for research offered by Dr. A. Dohrn’s Zoological Station at Naples which has since become so celebrated. Here he did the work which was subsequently published in 1878 in his Monograph of the Development of Elasmobranch Fishes, and which constituted the most important addition to vertebrate morphology since the days of Johannes Müller. This was followed in 1879 and 1881 by the publication of his Treatise on Comparative Embryology, the first work in which the facts of the rapidly growing science were clearly and philosophically put together, and the greatest. The influence of Balfour’s work on embryology was immense and is still felt. He was a scientific worker in every department of it, and there are few groups of the animal kingdom on which he has not left the impress of his genius.

In the period under consideration the output of embryological work has been enormous. No group of the animal kingdom has escaped exhaustive examination, and no effort has been spared to obtain the embryos of isolated and out of the way forms, the development of which might have a bearing upon important questions of phylogeny and classification. Of this work it is impossible to speak in detail in this summary. It is only possible to call attention to some of its more important features, to mention the more important advances, and to refer to some of the more striking memoirs.

Marine zoological stations have been established, expeditions have been sent to distant countries, and the methods of investigation have been greatly improved. Since Anton Dohrn founded the Natural History Zoological Station at Naples in 1871, observatories for the study of marine organisms have been established in distant countries. Of journeys which have been made to distant countries and which have resulted in important contributions to embryology, may be mentioned the expedition (1884–1886) of the cousins Sarasin to Ceylon (development of Gymnophiona),
of E. Selenka to Brazil and the East Indies (development of Marsupials, Primates and other mammals, 1877, 1880, 1892), of A. W. H. Wubrecht to the East Indies (1896, development of Tarsius), of W. H. Caldwell to Australia (1883–1884, discovery of the nature of the ovum and oviposition of Echidna and of Cetorodus), of A. Sedgwick to the Cape (1883, development of Peripatus), of J. Graham Kerr to Paraguay (1866, development of Lepidodermus), of R. Semon to Australia and the Malay Archipelago (1893–1993, development of Monotremata, Marsupialia), and of J. S. Budgett to Africa (1898, 1900, 1901, 1903, development of Polypterus).

In methods, while great improvements have been made in the processes of hardening and staining embryos, the principal advance has been the introduction in 1883 by W. H. Caldwell in his work on the development of Phoroniis of the method of making tape-worm like strings of sections as a result of which the process of mounting in order all the sections obtained from an embryo was much facilitated, and the use of an automatic microtome rendered possible. The method of Golgi for the investigation of the nervous system, introduced in 1875, must also be regarded as of the same period.

The word “coelom” (q.v.) was introduced into zoology by E. Haeckel in 1872 (Kalkschwämme, p. 468) as a convenient term for the body-cavity (pleuroperitoneal). The word was generally adopted, and was applied alike to the blood-containing body-cavity of Arthropods and to the body-cavity of Vertebrata and segmented worms, in which there is no blood. In 1875 Huxley (Quarterly Journal of Mic. Science, 15, p. 53), relying on the researches of Agassiz, Metchnikoff and Kowalevsky above mentioned, put forward the idea that according to their development three kinds of body-cavity ought to be distinguished: (1) the enterocoelic which arises from enteric diverticula, (2) the schizocoelic which develops as a split in the embryonic mesoblast, and (3) the epicoe lic which was enclosed by folds of the skin and lined by ectoderm (e.g. atrial cavity of Tunicates, &c.). This suggestion was of great importance, because it led the embryologists of the day (Balfour, the brothers Hertwig, Lankester and others) to discuss the question as to whether there was not more than one kind of body-cavity. The Hertwigs (Codemembranograph in, 1881) distinguished two kinds, the enterocoel and the pseudocoel. The former, to which they limited the use of the word coelom, and which is developed directly or indirectly from the enteron, is found in Annelida, Arthropoda, Echinodermata, Chordata, &c. The latter they regarded as something quite different from the coelom and as arising by a split in what it called for the first time mesenchyme; the mesenchyme being the non-epithelial mesoderm, which they described as consisting of amoeboid cells, but which we now know to consist of a continuous reticulum. The next step was made by E. Ray Lankester, who in 1884 (Zoologischer Illustrator) showed that the pericardium of Mollusca does not contain blood, and therein differs from the rest of the body-cavity which does contain blood, but no suggestion is made that the blood-containing space is not coelomic. In fact it was generally held by the anatomists of the day that the coelom and the vascular system were different parts of the same primitive organ, though separate from it in the adult except in Arthropoda and Mollusca. In the Mollusca, it is true, the pericardial part of the coelom was held to be separate from the vascular, and the Hertwigs had reached the correct conception that the pericardium of these animals was alone true coelom, the vascular part being pseudocoel. This was the state of morphological opinion until 1886, when it was shown (Proc. Cambridge Phil. Soc., 6, 1886, p. 27) that the coelom of Peripatus gives rise to the nephridia and generative glands only, and to no other part of the body-cavity of the adult, (2) that the nephridia of the adult do not open as had been supposed into the body-cavity, (3) that the body-cavity is entirely formed of the blood-containing space, the coelom having no perivisceral portion. These results were extended by the same author (Quart. Jour. Mic. Sci., 27, 1887, pp. 286–340) to other Arthropods and to the Mollusca, and the modern theory of the coelom was finally established. An increased precision was given to the conception of coelom by the discovery in 1886 (Quart. Jour. Mic. Sci., 20, p. 164) that the nephridia of Elasmobranchs are a direct differentiation of a portion of it. In 1886 this was extended to Peripatus (Proc. Camb. Phil. Soc., 6, p. 27) and doubtless holds universally.

In 1864 it was suggested by V. Hensen (Virchow’s Archiv, 31) that the rudiments of nerve-fibres are present from the beginning of development as persistent remains of connections between the incompletely separated cells of the segmented ovum. This suggestion fell to the ground because it was held by embryologists that the cleavage of the ovum resulted in the formation of completely separate cells, and that the connections between the adult cells were secondary. In 1886 it was shown (Quarterly Jour. Mic. Sci., 26, p. 182) that in Peripatus Cephalopod the cells of the segmenting ovum do not separate from one another, but remain connected by a loose protoplasmic network. This discovery has since been extended to other ova, even to the small so-called holoblast ovum, and a basis of fact was found for Hensen’s suggestion as to the embryonic origin of nerves (Quart. Jour. Mic. Sci., 35, 1892, pp. 581–584). An extension and further development of the nervous cell theory and the embryonic origin of nerves thus necessitated was made in 1894 (Quarter. Jour. Mic. Sci., 37, p. 87), and in 1904 J. Graham Kerr showed that the motor nerves in the dipnoan fish Lepidodermis arise in an essentially similar manner (Trans. Roy. Soc. of Edinburgh, 41, p. 119).

In 1883 Elie Metchnikoff published his researches on the intracellular digestion of invertebrates (Arbeiten a. d. zoologischen Inst. Wien, 5; and Biologisches Centralblatt, 3, p. 560), these formed the basis of his theory of inflammation and phagocytosis, which has had such an important influence on pathology. As he himself has told us, he was led to make these investigations by his precedent researches on the development of sponges and other invertebrates. To quote his own words: “Having long studied the problem of the germinal layers in the animal series, I sought to give some idea of their origin and significance. The part played by the ectoderm and endoderm appeared quite clear, and the former might reasonably be regarded as the cutaneous investment of primitive multicellular animals, while the latter might be regarded as their organ of digestion. The discovery of intracellular digestion in many of the lower animals led me to regard this phenomenon as characteristic of those ancestral animals from which might be derived all the known types of the animal kingdom (excepting, of course, the Protozoa). The origin and part played by the mesoderm appeared the most obscure. Thus certain embryologists supposed that this layer corresponded to the reproductive organs of primitive animals: others regarded it as the prototype of the organs of locomotion. My embryological and physiological studies on sponges led me to the conclusion that the mesoderm must function in the hypothetically primitive animals as a mass of digestive cells, in all points similar to those of the endoderm. This hypothesis necessarily attracted my attention to the power of seizing foreign corpuscles possessed by the mesodermic cells” (Immunity in Infective Diseases, English translation, Cambridge, 1903).

The branch of embryology which concerns itself with the study of the origin, history and conjugation of the individuals (gametes) which are concerned in the reproduction of the species has made great advances. These began in 1875 and following years with a careful examination of the behaviour of the germinal vesicle in the maturation and fertilization of the ovum. The history of the polar bodies, the origin of the female pronucleus, the presence in the ovum of a second nucleus, the male pronucleus, which gave rise to the first segmentation nucleus by fusion with the female pronucleus, were discovered (E. van Beneden, O. Bütschli, O. Hertwig, H. Foll), and in 1876 O. Hertwig (Mor phologisches Jahrbuch, 3, 1876) for the first time observed the entrance of a spermatozoon into the egg and the formation of the male pronucleus from it. The centrosome was discovered by W. Flemming in 1875 in the egg of the fresh-water mussel, and independently in 1876 by E. van Beneden in Dicyemids. In 1883 came E. van Beneden’s celebrated discovery (Arch. [HISTORY]
EMBRYOLOGY

Physiology of Development

Physiology of Development [in German, Entwicklungsmechanik (W. Roux), Entwicklungsphysiologie (H. Driesch), physiologische Morphologie (J. Loeb)] is, in the broadest meaning of the word, the experimental science of morphogenesis, i.e., of the laws that govern morphological differentiation. In this sense it embraces the study of regeneration and variation, and would, as a whole, best be called rational morphology. Here we shall treat of the Physiology of Development in a narrower sense, as the study of the laws that govern the development of the adult organism from the egg, regeneration and variation and selection forming the subjects of special articles.

After the work done by W. His, A. Goette and E. F. W. Pflüger, who gave a sort of general outline and orientation of the subject, the first to study developmental problems properly in a systematic way, and with full consciousness of their great importance, was Wilhelm Roux. This observer, having worked by a full analysis of the facts of “development” that the first special problem to be worked out was the question when and where the first differentiation appeared, got as his main result that, when one of the two first blastomeres (cleavage cells) of the frog’s egg was killed, the living one developed into a typical half-embryo, i.e., an embryo that was either the right or the left part of a whole one. From that Roux concluded that the first cleavage plane determined already the median plane of the adult; and that the basis of all differentiation was given by an unequal division of the nuclear substances during karyokinesis, a result that was also attained on a purely theoretical basis by A. Weissmann. Hans Driesch repeated Roux’s fundamental experiment with a different method on the sea-urchin’s egg, with a result that was absolutely contrary to that of Roux: the isolated blastomere cleaved like half the egg, but it resulted in a whole blastula and a whole embryo, which differed from a normal one only in its small size. Driesch’s result was obtained in somewhat the same manner by E. B. Wilson with the egg of Amphioxus, Zoja with the egg of Ascidia, and with full conviction very probably that an inequality of nuclear division could not be the basis of differentiation. The following experiments were still more fatal to the theories of Roux and of Weissmann. Driesch found that even when the first eight or sixteen cells of the cleaving egg of the sea-urchin were brought into quite abnormal positions with regard to one another, still a quite normal embryo was developed; Driesch and T. H. Morgan discovered jointly that in the Ctenophore egg one isolated blastomere developed into a half-embryo, but that the same was the case if a portion of protoplasm was cut off from the fertilized egg not yet in cleavage; last, but of least importance, in the case of the frog’s egg which had been Roux’s actual subject of experiment, conditions were discovered by O. Schultze and O. Hertwig.
under which one of the two first blastomeres of this egg developed into a whole embryo of half size. This result was made still more striking by Herbst, who showed that it was quite in the power of the experimenter to get either a half-embryo or a whole one half the size, the latter dependent only upon giving to the blastomere the opportunity for a rearrangement of its matter by turning it over.

Thus we may say that the general result of the introductory series of experiments in the physiology of development is the following:—In many forms, e.g., Echinoderms, Amphioxus, Ascidians, Fishes and Medusae, the potentiality (prospective Potenz—Driesch) of all the blastomeres of the segmented egg is the same, i.e., each of them may play any or every part in the future development; the prospective value (prosp. Bedeutung—D.) of each blastomere depends upon, or is a function of, its position in the whole of the segmented egg; we can term the "whole" of the egg after cleavage an "aequipotential system" (Driesch). But though aequipotential, the whole of the segmented egg is nevertheless not devoid of orientation or direction; the general law of causality compels us to assume a general orientation of the smallest parts of the egg, even in cases where we are not able to see it. It has been experimentally proved that external stimuli (light, heat, pressure, &c.) are not responsible for the first differentiation of organs in the embryo; that the egg is entire when it is divided so as to yield two equal parts, and that these would be incomprehensible if the first organs should be formed at one special point of it and not at another. Besides this general argument, we see a sort of orientation in the typical forms of the polar or bilateral cleavage stages.

Differentiation, therefore, depends on a primary, i.e., innate, orientation of the egg's plasma in those forms, the segmented eggs of which represent aequipotential systems; this orientation is capable of a sort of regulation or restoration after disturbances of any sort; in the egg of the Ctenophora, for instance, a such a regulation is not possible, and in the frog's egg it is facultative, i.e., possible under certain conditions, but impossible under others. Should this interpretation be right, the difference between the eggs of different animals would not be so great as it seemed at first; differences with regard to the potentialities of the blastomeres would only be differences with regard to the capability of regulation or restoration of the egg's protoplasm.

The foundation of physiological embryology being laid, we now can shortly deal with the whole series of special problems offered to us by a general analysis of that science, but at present we will confine ourselves to the following.

We may ask the following questions:—What are the general conditions of development? On what general factors does it depend? How do the different organs of the partly developed embryo stand with regard to their future fate? What are the stimuli (Reiz) for differentiation? What is it we are to say about the specific character of the different formative effects? And as the most important question of all: Are all the problems offered to us in the physiology of development to be solved with the aid of the laws known hitherto in science, or do we want specifically new "vitalistic" factors?

Energy in different forms is required for development, and is provided by the surrounding medium. Light, though of no influence on the cleavage (Driesch), has a great effect on later stages of development, and is also necessary for the formation of polyps in Eudendrum (J. Loeb).

That a certain temperature is necessary for ontogeny has long been known; this was carefully studied by O. Hertwig, as was also the influence of heat on the rate of development. Oxygen is also wanted, either from a certain stage of development or from the very beginning of it, though very nearly related forms differ in this respect (Loeb). The great influence of osmotic pressure on growth was studied by J. Loeb, C. Herbst and C. H. Davenport. In all these cases energy must be necessary for the formation of a specific organ; it is clear that, especially in the latter case, energy is shown to be a proper factor for morphogenesis. Besides energy, a certain chemical condition of the medium, whether offered by the water in which the egg lives or (especially in later stages) by the food, is of great importance for normal ontogeny; the only careful study in this respect was carried out by Herbst for the development of the egg of Echinids. This investigator has shown that all salts of the sea water are of great importance for development, and most of them specifically and typically; for instance, calcium is absolutely necessary for holding together the embryonic cells, and without calcium all cells will fall apart, though they do not die, but live to develop further.

What we have dealt with may be called external factors of development; as to their complement, the internal factors, it is clear that every elementary factor of general physiology may be regarded as one of them. Chemical metamorphosis plays, of course, a great part in differentiation, especially in the form of secretions; but very little has been carefully studied in this respect. Movement of living matter, whether of cells or of intracellular substance, is another important factor (O. Bützchi, F. Dreyer, L. Rhumbler.) Cell-division is another, its differences in direction, rate and quantity being of great importance for differentiation. We know very little about it; a so-called law of O. Hertwig, that a cell would divide at right angles to its longest diameter, though experimentally stated in some cases, does not hold for all, and the only thing we can say is, that the unknown primary organization of the egg is here responsible. (Compare the papers on cell-lineage of E. B. Wilson, F. R. Lillie, H. S. Jennings (Zurich) and W. Roux. Of another kind is the fact that there is another category that may be called physical, that already spoken of being physiological. The most important of these is the capillarity of the cell surfaces. Berthold was the first to call attention to its role in the arrangement of cell composites, and afterwards the matter was more carefully studied by Dreyer, Driesch, and especially W. Roux, with the result that the arrangement of cells follows the principle of surfaces minimaæ areas (Plateau) as much as is reconcilable with the conditions of the system.

It has already been shown that in many cases the embryo after cleavage, i.e. the blastula, is an "aequipotential system." It was shown that in the egg of Echinids there existed such an absolute lack of determination of the cleavage cells that (a) the cells may be put in quite abnormal positions with reference to one another without disturbing development; (b) a quater blastomere gives a quite normal little pluteus, even a sixteenth yields a gastrula; (c) two eggs may fuse in the early blastula stage, giving one single normal embryo of double size. Our next question concerns the distribution of the embryonic organs the blastula stage; would this remain unchanged in the blastula stage. In this case it has been shown that the potentialities of the different embryonic organs are different: that, for instance, in Echinoderms or Amphibians the ectoderm, when isolated, is not able to form endoderm, and so on (Driesch, D. Barfurth); but it has been shown at the same time that the ectoderm in itself, the intestine in itself of Echinoderms (Driesch), the medullary plate in itself of Triton (H. Spemann), is as aequipotential as was the blastula: that any part whatever of these organs may be taken away without disturbing the development of the rest into a normal and proportional embryonic part, except for its smaller size.

If the single phases of differentiation are to be regarded as effects, we must ask for the causes, or stimuli, of these effects. For a full account of the subject we refer to Herbst, by whom also the whole botanical literature, much more important than the zoological, is critically reviewed. We have already seen that when the blastula represents an aequipotential system, there must be some sort of primary organization of the egg, recoverable after disturbances, that directs and localizes the formation of the different organs; we do not know much about this organization. Directive stimuli (Richtungsspannen) play a great role in ontogeny; Herbst has analysed many cases where their existence is probable. They have been experimentally proved in two cases. The chromatic cells of the yolk sac of Fundulus are attracted by the oxygen of the arteries (Loeb); the mesenchyme cells of Echinus are attracted by some specific parts of the ectoderm, for they move towards them also when removed from their original positions to any point of the blastocoel by shaking (Driesch). Many directive stimuli might
be discovered by a careful study of grafting experiments, such as have been made by Born, Joest, Harrison and others, but at present these experiments have not been carried out far enough to get exact results.

Formative stimuli in a narrower meaning of the word, i.e. stimuli affecting the origin of embryonic organs, have long been known in botany; in zoology we know (especially from Loeb) a good deal about the influence of light, gravitation, contact, &c., on the formation of organs in hydroids, but these forms are very plant-like in many respects; as to free-living animals, Herbst proved that the formation of the arms of the pluteus larva depends on the existence of the calcareous tetrahedra, and made in other cases (lens of vertebrate eye, nerves and muscles, &c.) the existence of formative stimuli very probable. Many of the facts generally known as functional adaptation ("functionelle Anpassung"—Roux) in botany and zoology may also belong to this category, i.e. be the effects of some external stimulus, but.set they far from having been studied as satisfactorily. That the structure of parts of the vertebrate skeleton is always in relation to their function, even under abnormal conditions, is well known; what is the real "cause" of differentiation in this case is difficult to say.

It is obvious that we cannot answer the question why the different ontogenetic effects are just what they are. Developmental physiology takes the specific nature of form for granted, and it may be left for a really rational theory of the evolution of species in the future to answer the problem of species, as far as it is answerable at all. What we intend to do here is only to say in a few words wherein consists the specific character of embryonic organs. That embryonic parts are specific or typical in regard to their protoplasm is obvious, and is well proved by the fact that the different parts of the embryo react differently to the same chemical or other reagents (Herbst, Loeb). That they may be typical also in regard to their nuclei; was shown by Boveri for the generative cells of Ascaris; we are not able at present to say anything definite about the importance of this fact. The specific nature of an embryonic organ consists to a high degree in the number of cells composing it; it was shown for many cases that this number, and also the size of cells, is constant under constant conditions, and that under inconstant conditions the number is variable, the size constant; for instance, embryos which have developed from one of the two first blastomeres show only half the normal number of cells in their organs (Morgan, Driesch).

We have learnt that the successive steps of embryonic development are to be regarded as effects, caused by stimuli, which partly exist in the embryo itself. But it must be noted that not every part of the embryo is dependent on every other one, but that there exists a great independence of the parts, to a varying degree in every case. This partial independence (Selbstdifferenzierung) by Roux, and is certainly a characteristic feature of ontogeny. At the same time it must not be forgotten that the word is only relative, and that it only expresses our recognition of a negation.

For instance, we know that the ectoderm of Echinus may develop further if the endoderm is taken away; in other words, that it develops by self-differentiation in regard to the endoderm, that its differentiation is not dependent on the endoderm; but it would be obviously more important to know the factors on which this differentiation is actually dependent than to know one factor on which it is not. The same is true for all other experiments on "self-differentiation," whether analytical (Loeb, Schaper, Driesch) or not (grafting experiments, Born, Joest, &c.).

Can we understand differentiation by means of the laws of natural phenomena offered to us by physics and chemistry? Vitalism. Most people would say yes, though not yet. Driesch tried to show that he is absolutely not able to understand development, at any rate one part of it, i.e. the localization of the various successive steps of differentiation. But it is impossible to give any idea of this argument in a few words, and we can only say here that it is based on the experiments upon isolated blastomeres, &c., and on an analysis of the character of equipotential systems. In this way, physiology of development would lead us straight on to vitalism.

References. An account of the subject, with full literature, is given by H. Driesch, Resultate und Probleme der Entwicklungsphysiologie der Tiere in Ergebniss der Anat. u. Entw.-Gesch. (1899). The most important works are: C. H. Davenport, Experimental Morphology (New York, 1897); and C. D. &c. (1895); Driesch, Malhein. bev. Betrachtung morpholog. Probleme (Jena, 1891); Entwicklungsmechan. Studien (1891-1893); Analytische Theorien d. organ. Entw. (Leipzig, 1894); Studien über d. Fortpflanzungsvorg. (Jena, 1893); Malhein. bev (Jena, 1894). Further, the problems of nutrition and of the development of the nervous system and the processes of the formation of the nervous system and the processes of the 

"EMDEN, a maritime town of Germany, in the Prussian province of Hanover, near the mouth of the Elbe, m. N.W. from Oldenburg by rail. Pop. (1885) 14,101; (1905) 20,754. The town once flowed beneath its walls, but is now 2 m. distant, and connected with the town by a broad and deep canal, divided into the inner (or dock) harbour and the outer (or "free port") harbour. The latter is ¾ m. in length, has a breadth of nearly 400 ft., and since the construction of the Elbe-Jade and Dortmund-Elbe canals, has been deepened to 38 ft., thus allowing the largest sea-going vessels to approach its wharves. The town is intersected by canals (crossed by numerous bridges), which bring it into communication with most of the towns in East Prussia, and is the chief port of the Elbe. The waterways which traverse and surround it, and the abundance of its numerous gabled medieval houses give it the appearance of an old Hanseatic town, rather than of a German town. Of its churches the most noteworthy are the 

Reformed "Great Church" (Grosse Kirche), a large Gothic building completed in 1455, containing the tomb of Enno II. (d. 1540), count of East Friesland; the Gasthauskirche, formerly the church of a Franciscan friary founded in 1317; and the Neue Kirche (1643-1647). Of its secular buildings, the Rathaus (town-hall), built in 1574-1576, on the model of that of Antwerp, with a lofty tower, and containing an interesting collection of arms and armour, is particularly remarkable. There are numerous educational institutions, including classical and modern schools, and schools of commerce, navigation, and telegraphy. The town has two interesting museums. Emden is the seat of an active trade in agricultural produce and live-stock, horses, timber, coal, tea and wine. The deep-sea fishing industry of the town is important, the fishing fleet in 1902 numbering 67 vessels. Machinery, cement, cordage, wire ropes, tobacco, leather, &c. are manufactured. Emden is also of importance as the station of the submarine cables connecting Germany with England, North America and Spain. It has a regular steamboat service with Borkum and Norderney."

Emden (Emden, Emetha) is first mentioned in the 12th century, when it was the capital of the Emsland (Emsgau, or county of the Ems), one of the three hereditary countships into which East Friesland had been divided by the emperor. In 1252 the countship was sold to the bishops of Münster; but their rule soon became little more than nominal, and in Emden itself the family of Abenda, the episcopal provosts and castellans, established their practical independence. Towards the end of the 14th century the town gained a considerable trade owing to the permission given by the provost to the pirates known as "Viktualienbrüder" to trade in their market, after they had been driven out of Gothland by the Teutonic Order. In 1422, after the defeat of the pirates off Heligoland by the fleet of Hamburg, Emden was besieged, but it was not reduced by Hamburg, with the aid of Edward I. of the Commonwealth of Utherby, until 1431. The town was held jointly by its captors till 1453, when Hamburg sold
its rights to Ulrich Cirkena, created count of East Friesland by the emperor Frederick III in 1454. In 1544 the Reformation was introduced, and in the following years thousands of Protestant refugees from the Low Countries found their way to the town. In 1505 Emden became a free imperial city under the protection of Holland, and was occupied by a Dutch garrison until 1744 when, with East Friesland, it was transferred to Prussia. In 1810 Emden became the chief town of the French department of Ems Oriental; in 1815 it was assigned to Hanover, and in 1866 was annexed with that kingdom by Prussia.

See Führinger, Die Stadt Emden in Gegenwart und Vergangenheit (Emden, 1892).

EMERALD, a bright green variety of beryl, much valued as a gem-stone. The word comes indirectly from the Gr. ἑρμαράγδος (Arabic zamurrad), but this seems to have been a name vaguely given to a number of stones having little in common except a green colour. Flinny’s “amaragda” undoubtedly included several distinct species. Much confusion has arisen with reference to the “emerald” of the Scriptures. The Hebrew word נֶפֶח, rendered emerald in the Authorized Version, probably meant the carbuncle: it is indeed translated δηραζε in the Septuagint, and a marginal reading in the Revised Version gives carbuncle. On the other hand, the word 바로Gatt, rendered ἑρμάραγδος in the LXX., appears in the A.V. as carbuncle, with the alternative reading of emerald in the R.V. It may have referred to the true emerald, but Flinders Petrie suggests that it meant rock-crystal.

The properties of emerald are mostly the same as those described under BERYL. The crystals often show simply the hexagonal prism and basal plane. The prisms cleave, though imperfectly, at right angles to the geometrical axis; and hexagonal slices were formerly worn in the East. Compared with most gems, the emerald is rather soft, its hardness (7.5) being but slightly above that of quartz. The specific gravity is low, varying slightly in stones from different localities, but being for the Muzo emerald about 2.69. The refractive and dispersive powers are not high, so that the cut stones display little brilliancy or “fire.” The emerald is dichroic, giving in the dichroscope a bluish-green and a yellowish-green image. The magnificent colour which gives extraordinary value to this gem, is probably due to chromium, F. Wöhler found 0.186% of Cr₂O₃ in the emerald of Muzo,—a proportion which, though small, is sufficient to impart an emerald-green colour to glass. The stone loses colour when strongly heated, and M. Lewy suggested that the colour was due to an organic pigment. Greville Williams showed that emeralds lost about 9% of their weight on fusion, the specific gravity being reduced to about 2.4.

The ancients appear to have obtained the emerald from Upper Egypt, where it is said to have been worked as early as 1650 b.c. It is known that Greek miners were at work in the time of Alexander the Great, and in later times the mines yielded their gems to Cleopatra. Remains of extensive workings were discovered in the northern Ethei by the French traveller, F. Caillaud, in 1847, and the mines were re-opened for a short time under Mehmet Ali. “Cleopatra’s Mines” are situated in Jebel Sikait and Jebel Zabra near the Red Sea coast of Aswan. The workings were visited in 1891 by E. A. Floyer, and the Sikait workings were explored in 1900 by D. A. MacAlister and others. The Egyptian emeralds occur in mica-schist and talc-schist.

On the Spanish conquest of South America vast quantities of emeralds were taken from the Peruvians, but the exact locality which yielded the stones was never discovered. The only South American emeralds now known occur near Bogotá, the capital of Colombia. The most famous mine is at Muzo, but workings are known also at Coscue and Somonoco. The emerald occurs in nests of calcite in a black bituminous limestone containing ammonites of Lower Cretaceous age. The mineral is associated with quartz, dolomite, pyrites, and the rare mineral called “pariste”—a fluo-carbonate of the cerium metals, occurring in brownish-yellow hexagonal crystals, and named after J. J. Paris, who worked the emeralds. It has been suggested that the Colombian emerald is not in its original matrix. The fine stones are called cabutillos and the interior ones mortillones.

In 1830 emeralds were accidentally discovered in the Ural Mountains. At the present time they are worked on the river Takovaya, about 60 m. N.E. of Ekaterinburg, where they occur in mica-schist, associated with aquamarine, alexandrite, phenacite, &c. Emerald is found also in mica-schist in the Habachtal, in the Salzburg Alps, and in granite at Eidsvold in Norway. Emerald has been worked in a vein of pegmatite, piercing slaty rocks, near Emmaville, in New South Wales. The crystals occurred in association with topaz, fluor spar and cassiterite; but they were mostly of rather pale colour. In the United States, emerald has occasionally been found, and fine crystals have been obtained from the workings for hiddenite at Stony-point, Alexander county, N.C.

Many virtues were formerly ascribed to the emerald. When worn, it was held to be a preservative against epilepsy, it cured dysentery, it assisted women in childbirth, it drove away evil spirits, and preserved the chastity of the wearer. Administered internally it was reputed to have great medicinal value. In consequence of its refreshing green colour it was naturally said to be good for the eyesight.

The stone known as “Oriental emerald” is a green corundum. Lithia emerald is the mineral called hiddenite; Uralian emerald is a name given to demantoid; Brazilian emerald is merely green tourmaline; evening emerald is the peridot; pyro-emerald is fluor spar which phosphoresces with a green glow when heated; and “mother of emerald” is generally a green quartz or perhaps in some cases a green felspar.

See AQUAMARINE, BERYL.

ÉMERIC-DACRY, TOUSSAINT-BERNARD (1755-1839), French archaeologist and writer on art, was born at Aix, in Provence, on the 20th of August 1755. He was destined for the legal profession, and having gone in 1775 to Paris to complete his legal education, he acquired there a taste for art which influenced his whole future career, and he went to Italy, where he continued his art studies. He soon returned, however, to his native village, and followed for some time the profession of an advocate; but in 1787 he succeeded his uncle Antoine David as printer to the parliament. He was elected mayor of Aix in 1791; and although he speedily resigned his office, he was in 1793 threatened with arrest, and had for some time to adopt a vagrant life. When danger was past he returned to Aix, sold his printing business, and engaged in general commercial pursuits; but he was not long in renouncing these also, in order to devote himself exclusively to literature and art. From 1809 to 1814, under the Empire, he represented his department in the Lower House (Corps législatif); in 1814 he voted for the downfall of Napoleon; in 1815 he retired into private life, and in 1816 he was elected a member of the Institute. He died in Paris on the 2nd of April 1839. Émeric-David was placed in 1825 on the commission appointed to continue L’histoire littéraire de la France. His principal works are Recherches sur l’art statuaire, considérés les anciens et les modernes (Paris, 1805), a work which obtained the prize of the Institute; Suite d’études calquées et dressées d’après cinq tableaux de Raphael (Paris, 1818-1821), in 4 vols. fol.; Jupiter, ou recherches sur ce dieu, sur son culte, &c. (Paris, 1837), 2 vols., illustrated; and Vaucain (Paris, 1857).

EMERITUS (Lat.), a term used of Roman soldiers and public officials who had earned their discharge from the service, a veteran, and hence applied, in modern times, to a university professor (professor emeritus) who has vacated his chair, on account of long service, age or infirmity, and, in the Presbyterian church, to a minister who has for like reason given up his charge.

EMERSON, RALPH WALDO (1803-1882), American poet and essayist, was born in Boston, Massachusetts, on the 25th of May 1803. Seven of his ancestors were ministers of New England churches. Among them were some of those men of mark who made the backbone of the American character: the sturdy Puritan, Peter Bulkeley, sometime rector of Odell in Bedfordshire, and afterward pastor of the church in the wilderness at Concord, New Hampshire; the zealous evangelist, Father Samuel Moody of Agamenticus in Maine, who pursued graceless sinners even...
into the alehouse; Joseph Emerson of Malden, "a heroic scholar," who prayed every night that no descendant of his might ever be rich; and William Emerson of Concord, Mass., the patriot preacher, who died while serving in the army of the Revolution. Sprung from such stock, Emerson inherited qualities of self-reliance, love of liberty, strenuous virtue, sincerity, sobriety and fearless loyalty to ideals. The form of his ideals was modified by the metamorphic glow of Transcendentalism which passed through the region of Boston in the second quarter of the 19th century. But the spirit in which Emerson conceived the laws of life, reverenced them and lived them out, was the Puritan spirit, elevated, enlarged and beautified by the poetic temperament.

His father was the Rev. William Emerson, minister of the First Church (Unitarian) in Boston. Ralph Waldo was the fourth child in a family of eight, of whom at least three gave evidence of extraordinary mental powers. He was brought up in an atmosphere of hard work, of moral discipline, and (after his father's death in 1811) of that wholesome self-sacrifice which is a test of life for those who are poor in money and rich in spirit. His aunt, Miss Mary Moody Emerson, a brilliant observer, an eccentric saint, was a potent factor in his education. Loving him, believing in his powers, passionately desiring for him a successful career, but clinging with both hands to the old forms of faith from which he floated away, this solitary, intense woman did as much as any one to form, by action and reaction, the mind and character of the young Emerson. In 1817 he entered Harvard College, and graduated in 1821. In scholarship he ranked about the middle of his class. In literature and oratory he was more distinguished, receiving a Boylston prize for declamation, and two Bowdoin prizes for dissertations, the first essay being on "The Character of Socrates" and the second on "The Present State of Ethical Philosophy"—both rather dull, formal, didactic productions. He was fond of reading and of writing verse, and was chosen as the poet for class-day. His cheerful serenity of manner, his tranquil Christlikeness, and the steady charm of his personality made him a favourite with his fellows, in spite of a certain reserve. His literary taste was conventional, including the standard British writers, with a preference for Shakespeare among the poets, Berkeley among the philosophers, and Montaigne (in Cotton's translation) among the essayists. His particular admiration among the college professors was the stately rhetorician, Edward Everett; and this predilection had much to do with his early ambition to be a professor of rhetoric and elocution.

Immediately after graduation he became an assistant in his brother William's school for young ladies in Boston, and continued teaching, with much inward reluctance and discomfort, for three years. The routine was distasteful; he despised the superficial details which claimed so much of his time. The bonds of conventionalism were silently dissolving in the rising glow of his poetic nature. Independence, sincerity, reality, grew more and more necessary to him. His aunt urged him to seek retirement, self-reliance, friendship with nature; to be no longer "the nailing of surrounding circumstances," but the master of his, the central van of his being, the residence of his soul. The passion for spiritual leadership stirred within him. The ministry seemed to offer the fairest field for its satisfaction. In 1825 he entered the divinity school at Cambridge, to prepare himself for the Unitarian pulpit. His course was much interrupted by ill-health. His studies were irregular, and far more philosophical and literary than theological. In October 1826 he was "appropos to preach" by the Middlesex Association of Ministers. The same year a threatened consumption compelled him to take a long journey in the south. Returning in 1827, he continued his studies, preached as a candidate in various churches, and improved in health. In 1829 he married a beautiful but delicate young woman, Miss Ellen Tucker of Concord, and was installed as associate minister of the Second Church (Unitarian) in Boston. The retirement of his senior colleague soon left him the sole pastor. Emerson's early sermons were simple, direct, unconventional. He dealt freely with the things of the spirit. There was a homely elevation in his discourses, a natural freshness in his piety, a quiet enthusiasm in his manner, that charmed thoughtful hearers. Early in 1832 he lost his wife, a sorrow that deeply depressed him in health and spirits. Following his passion for independence and sincerity, he arrived at the conviction that the Lord's Supper was not intended by Christ to be a permanent sacrament. To him, at least, it had become an outgrown form. He was willing to continue the service only if the use of the elements should be dropped and the rite made simply an act of spiritual remembrance. Setting forth these views, candidly and calmly, in a sermon, he found his congregation, not unnaturally, reluctant to agree with him, and therefore retired, not without some disappointment, from the pastoral office. He never again took charge of a parish; but he continued to preach, as opportunity offered, until 1847. In fact, he was always a preacher, though of a singular order. His supreme task was to befriend and guide the inner life of man.

The strongest influences in his development about this time were the liberating philosophy of Coleridge, the mystical visions of Swedenborg, the intimate poetry of Wordsworth, and the looting essays of Carlyle. On Christmas Day 1832 he took passage in a sailing vessel for the Mediterranean. He sailed through Italy, visited Paris, spent two months in Scotland and England, and saw the four men whom he most desired to see—Landor, Coleridge, Carlyle and Wordsworth. "The comfort of meeting such men of genius as these," he wrote, "is that they talk sincerely." But he adds that he found all four of them, in different degrees, deficient in insight into religious truth. His visit to Carlyle, in the lonely farm-house at Craigenputtock, was the memorable beginning of a lifelong friendship. Emerson published Carlyle's first books in America. Carlyle introduced Emerson's Essays into England. The two men were bound together by a mutual respect deeper than a sympathy of tastes, and a community of spirit stronger than a similarity of opinions. Emerson was a sweet-tempered Carlyle, living in the sunshine. Carlyle was a militant Emerson, moving amid thunderclouds.

The things that each admired in the other were self-reliance, directness, moral courage. A passage in Emerson's Diary, written on his homeward voyage, strikes the keynote of his remaining life. "A man contains all that is needful to his government within himself. ... All real good or evil that can befall him must be from himself. ... There is a correspondence between the human soul and everything that exists in the world; more properly, everything that is known to man. Instead of studying things without, the principles of them all may be penetrated into within him. ... The purpose of life seems to be to acquaint man with himself. ... The highest revelation is that God is in every man." Here is the essence of that intuitive philosophy, commonly called Transcendentalism. Emerson disclaimed allegiance to that philosophy. He called it "the saturnalia, or excess of faith." His practical common sense recoiled from the amazing conclusions which were drawn from it by many of its more eccentric advocates. His independence revolted against being bound to any scheme or system of doctrine, however nebulous. He said: "I wish to say what I feel and think to-day, with what I know to be true, and not to-day, with what I may be coerced to-day to predict it all." But this very wish commits him to the doctrine of the inner light. All through his life he navigated the Transcendental sea, piloted by a clear moral sense, warned off the rocks by the saving grace of humour, and kept from capsizing by a good ballast of New England prudence.

After his return from England in 1833 he went to live with his mother at the old manse in Concord, Mass., and began his career as a lecturer in Boston. His first discourses were delivered before the Society of Natural History and the Mechanics' Institute. They were chiefly on scientific subjects, approached in a poetic spirit. In the autumn of 1835 he married Miss Lydia Jackson of Plymouth, having previously purchased a spacious old house and garden at Concord. There he spent the remainder of his life, a devoted husband, a wise and tender father, a careful householder, a virtuous villager, a friendly neighbour, and, in spite of all his discarnations, the central and luminous figure among the
Transcendentalists. The doctrine which in others seemed to produce all sorts of extravagances—communistic experiments at Brook Farm and Fruitlands, weird schemes of political reform, long hair on men and short hair on women—in his sane, well-balanced nature served only to lend a ideal charm to the familiar outline of a plain, orderly New England life. Some mild departures from established routine he tranquilly tested and as tranquilly abandoned. He tried vegetarianism for a while, but gave it up when he found that it did him no particular good. An attempt to illustrate household equality by having the servants sit at table with the rest of the family was frustrated by the dislike of his two sensible domestics for such an inconvenient arrangement. His theory that manual labour should form part of the scholar's life was checked by the personal discovery that hard labour in the fields meant poor work in the study. "The writer shall not dig," was his practical conclusion. Intellectual independence was what he chiefly desired; and this, he found, could be attained in a manner of living not outwardly different from that of the average college professor or country minister. And yet it was to this property-holding, debt-paying, law-abiding, well-dressed, courtly-mannered citizen of Concord that the ardent and enthusiastic turned as the prophet of the new idealism. The influence of other Transcendental teachers, Dr Hedge, Dr Ripley, Bronson Alcott, Orestes Brownson, Theodore Parker, Margaret Fuller, Henry Thoreau, Jones Very, was narrow and parochial compared with that of Emerson. Something in his imperturbable, kindly presence, his angelic look, his musical voice, his commanding style of thought and speech, announced him as the possessor of the great secret which many were seeking—the secret of a freer, deeper, more harmonious life. More and more, as his fame spread, those who "would live in the spirit" came to listen to the voice, and to sit at the feet, of the Sage of Concord.

It was on the lecture-platform that he found his power and won his fame. The courses of lectures that he delivered at the Masonic Temple in Boston, during the winters of 1835 and 1836, on "Great Men," "English Literature," and "The Philosophy of History," were well attended and admired. They were followed by two discourses which commanded for him immediate recognition, part friendly and part hostile, as a new and potent personality. His Phi Beta Kappa oration at Harvard College in August 1837, on "The American Scholar," was an eloquent appeal for independence, sincerity, realism, in the intellectual life of America. His address before the graduating class of the divinity school at Cambridge, in 1838, was an impassioned protest against what he called "the defects of historical Christianity" (its undue reliance upon the personal authority of Jesus, and its failure to explore the moral nature of man as the fountain of established teaching), and a daring plea for absolute self-reliance and a new inspiration of religion. "In the soul," he said, "let redemption be sought. Wherever a man comes, there comes revolution. The old is for slaves. Go alone. Refuse the good models, even those which are sacred in the imagination of mankind, and yet are charity behind you, and acquire men at first hand with Deity." In this address Emerson laid his hand on the sensitive point of Unitarianism, which rejected the divinity of Jesus, but held fast to his supreme authority. A blaze of controversy sprang up at once. Conservatives attacked him; Radicals defended him. Emerson made no reply. But amid this somewhat fierce illumination he went forward steadily as a public lecturer. It was not his negations that made him popular; it was the eloquence with which he presented the positive side of his doctrine. Whatever the titles of his discourses, "Literary Ethics," "Man the Reformer," "The Present Age," "The Method of Nature," "Representative Men," "The Conduct of Life," their theme was always the same, namely, "the infinitude of the private man." Those who thought him astray on the subject of religion listened to him with delight when he poetized the commonplacest of art, politics, literature or the household. His utterance was Delphic, inspirational. There was magic in his elocution. The simplicity and symmetry of his sentences, the modulations of his thrilling voice, the radiance of his face, even his slightest hesitations and pauses over his manuscript, lent a strange charm to his speech. For more than a generation he went about the country lecturing in cities, towns and villages, before learned societies, rustic lyceums and colleges; and there was no man on the platform in America who excelled him in distinction, in authority, or in stimulating eloquence.

In 1847 Emerson visited Great Britain for the second time, was welcomed by Carlyle, lectured to appreciative audiences in Manchester, Liverpool, Edinburgh and London, made many new friends among the best English people, paid a brief visit to Paris, and returned home in July 1848. "I leave England," he wrote, "with increased respect for the Englishman. His stuff or substance seems to be the best in the world. I forgive him all his pride. My respect is the more generous that I have no sympathy with him, only an admiration." The impressions of this journey were embodied in a book called English Traits, published in 1856. It might be called "English Traits and American Confessions," for nowhere does Emerson's Americanism come out more strongly. But the America that he loved and admired was the ideal, the potential America. For the actual conditions of social and political life in his own time he had a fine scorn. He was an intellectual Brahmin. His principles were democratic, his tastes aristocratic. He did not like crowds, streets, hotels—"the people who fill them oppress me with their excessive civility." Humanity was his hero. He loved man, but he was not fond of men. He had grave doubts about universal suffrage. He took a sincere interest in social and political reform, but towards specific "reforms" his attitude was somewhat remote and visionary. On the subject of temperament he held aloof from the intemperate methods of the violent prohibitionists. He was a believer in woman's rights, but he was lukewarm towards conventions in favour of woman suffrage. Even in regard to slavery he had serious hesitations about the ways of the abolitionists, and for a long time refused to be identified with them. But as the irrepressible conflict drew to a head Emerson's hesitation vanished. He said in 1856, "I think we must get rid of slavery, or we must get rid of freedom." With the outbreak of the Civil War he became an ardent and powerful advocate of the cause of the Union. James Russell Lowell said, "To him more than to all other causes did the young martyrs of our Civil War owe the sustaining strength of thoughtful heroism that is so touching in every record of their lives."

Emerson the essayist was a condensation of Emerson the lecturer. His prose works, with the exception of the slender volume entitled Nature (1836), were collected and arranged from the manuscripts of his lectures. His method of writing was characteristic. He planted a subject in his mind, and waited for thoughts and illustrations to come to it, as birds or insects to a plant or flower. When an idea appeared, he followed it, "as a boy might hunt a butterfly"; when it was captured he pinned it in his "Thought-book." The writings of other men were for stimulating the reader, these for guidance. He said that books were for the scholar's idle times. "I value them," he said, "to make my top spin." His favourite reading was poetry and mystical philosophy: Shakespeare, Dante, George Herbert, Goethe, Berkeley, Coleridge, Swedenborg, Jakob Boehme, Plato, the new Platonists, and the religious books of the East (in translation). Next to these he valued books of biography and anecdote: Plutarch, Grimm, St Simon, Varnhagen von Ense. He had some odd dislikes, and could find nothing in Aristophanes, Cervantes, Shelley, Scott, Miss Austen, Dickens. Novels he seldom read. He was a follower of none, an original borrower from all. His illustrations were drawn from near and far. The zodiac of Denderah; the Savoyards who carved their pine-forests into toys; the naked Derar, horsed on an idea, charging a troop of Roman cavalry; the long, austere Fyskogarian histrum of silence; Napoleon on the deck of the "Bellerophon," observing the drill of the English soldiers; the Egyptian doctrine that every man has two pairs of eyes: Empedocles and his shoe; the horizontal stratification of the
EMERSON, W.—EMERY

EMERSON, W.—EMERY

EMERSON, WILLIAM (1701–1782), English mathematician, was born on the 14th of May 1701 at Hurworth, near Darlington, where his father, Dudley Emerson, also a mathematician, taught a school. Unsuccessful as a teacher he devoted himself entirely to studious retirement, and published many works which are singularly free from errata. In mechanics he never advanced a proposition which he had not previously tested in practice, nor published an invention without first proving its effects by a model. He was skilled in the science of music, the theory of sounds, and the ancient and modern scales, but he never attained any excellence as a performer. He died on the 20th of May 1782 at his native village. Emerson was eccentric and indeed clownish, but he possessed remarkable independence of character and intellectual energy. The boldness with which he expressed his opinions on religious subjects led to his being charged with scepticism, but for this there was no foundation.

Emerson’s works include The Doctrine of Fluxions (1748); The Projection of the Sphere, Orthographic, Stereographic and Gnomical (1749); The Elements of Trigonometry, (1749); The Principles of Induction (1752); A Treatise on Algebra, in two books (1753); The Arithmetic of Infinities, and the Differential Method, illustrated by Examples (1757); Mechanics, or the Doctrine of Motion (1760); The Elements of Optics, in four books (1762); A System of the Art of Navigation (1763); A Treatise on the Mathematic Principles of Geography (1770); Tracts (1770); Cyclomathesis, or an Easy Introduction to the several branches of the Mathematics (1770), in ten vols.; A Short Essay on Sir Isaac Newton’s Principles to which is added, A Defence of Sir Isaac against the objections that are made to several parts of his works (1770); A Miscellaneous Treatise containing several Mathematical Subjects (1775).

EMERY (Ger. Smirgel), an impure variety of corundum, much used as an abrasive agent. It was known to the Greeks under the name of άμφός or άμρα, which is defined by Dioscorides as a stone used in gem- engraving. The Hebrew word σμιρίον (related to the Egyptian asmir), where translated in our versions of the Old Testament adamatum and diamond, probably signifies a coarse corundum-stone or corundum.

Emery occurs as a granular or massive, dark-coloured, dense substance, having much the appearance of an iron-ore. Its specific gravity varies with its composition from 3.7 to 4.3. Under the microscope, it is seen to be a mechanical aggregate of corundum, usually in grains or minute crystals of a bluish colour, with magnetite, which also is granular and crystalline. Other iron oxides, like haematite and limonite, may be present as alteration-products of the magnetite. Some of the alumina and iron oxide may occasionally be chemically combined, so as to form an iron spinel, or hercynite. In addition to these minerals emery sometimes contains quartz, mica, tourmaline, cassiterite, &c. Indeed emery may be regarded as a rock rather than a definite mineral species.

The hardness of emery is about 8, whereas that of pure corundum is 9. The “abrasive power,” or “effective hardness,” of emery is by no means proportional to the amount of alumina which it contains, but seems rather to depend on its physical
EMETICS—EMEU

condition. Thus, taking the effective hardness of sapphire as 100, Dr. J. Lawrence Smith found that the emery of Samos with 70-10% of alumina had a corresponding hardness of 56; that of Naxos, with 68-53% of Al₂O₃, a hardness of 46; and that of Gumach with 77-82% of Al₂O₃, a hardness of 47.

Emery has been worked from a very remote period in the Isle of Naxos, one of the Cyclades, whence the stone was called naxium by Pliny and other Roman writers. The mineral occurs as loose blocks and as lenticular masses or irregular beds in granular limestone, associated with crystalline schists. The Naxos emery has been described by Professor G. Tschermak. From a chemical analysis of a sample it has been calculated that the emery contained 52-4% of corundum, 32-1% of magnetite, 11-5% of tourmaline, 2% of muscovite and 2% of margarite.

Important deposits of corundum were discovered in Asia Minor by J. Lawrence Smith, when investigating Turkish mineral resources about 1847. The chief sources of emery there are Gumach Dagh, a mountain about 12 m. E. of Ephesus; Kula, near Ala-shehr; and the mines in the hills between Thyra and Cosbonnar, south of Smyrna. The occurrence is similar to that in Naxos. The emery is found as detached blocks in a reddish soil, and as rounded masses embedded in a crystalline limestone associated with mica-schist, gneiss and granite. The proportion of corundum in this emery is said to vary from 37 to 57%. Emery is worked at several localities in the United States, especially near Chester, in Hampden county, Mass., where it is associated with peridotites. The corundum and magnetite are regarded by Dr. J. H. Pratt as basic segregations from an igneous magma. The deposits were discovered by H. S. Lucas in 1864.

The hardness and toughness of emery render it difficult to work, but it may be extracted from the rock by blasting in holes bored with diamond drills. In the East fire-setting is employed. The emery after being broken up is carefully picked by hand, and then ground or stamped, and separated into grades by wire sieves. The higher grades are prepared by washing and elutriation, the finest being known as "flour of emery." A very fine emery dust is collected in the stamping room, where it is deposited after floating in the air. The fine powder is used by lapidaries and plate-glass manufacturers. Emery-wheels are made by consolidating the powdered mineral with an agglutinating medium like shellac or silicate of soda or vulcanized india-rubber. Such wheels are not only used by dentists and lapidaries but are employed on a large scale in mechanical workshops for grinding, shaping and polishing steel. Emery-sticks, emery-cloth and emery-paper are made by coating the several materials with powdered emery mixed with glue, or other adhesive media.

(See Corundum.)

(F.W.R.*

EMETICS (from Gr. ἐμετικός, causing vomit), the term given to substances which are administered for the purpose of producing vomiting. It is customary to divide emetics into two classes, those which produce their effect by acting on the vomiting centre in the medulla, and those which act directly on the stomach itself. There is considerable confusion in the nomenclature of these two divisions, but all are agreed in calling the former class central emetics, and the latter gastric. The gastric emetics are in common use are alum, ammonium carbonate, zinc sulphate, sodium chloride (common salt), mustard and warm water. Copper sulphate has been purposely omitted from this list, since unless it produces vomiting very shortly after administration, being itself a violent gastro-intestinal irritant, some other emetic must promptly be administered. The central emetics are apomorphine, tartar emetic, ipecacuahua, senega and squill. Of these tartar emetic and ipecacuahua come under both heads: when taken by the mouth they act as gastric emetics before absorption into the blood, and later produce a further and more vigorous effect by stimulation of the medullary centre. It must be remembered, however, that, valuable though these drugs are, their action is accompanied by so much depression, they should never be administered except under medical advice.

Emetics have two main uses: that of emptying the stomach, especially in cases of poisoning, and that of expelling the contents of the air passages, more especially in children before they have learnt or have the strength to expectorate. Where a physician is in attendance, the first of these uses is nearly always replaced by lavage of the stomach, whereby any subsequent depression is avoided. Emetics still have their place, however, in the treatment of bronchitis, laryngitis and diphtheria in children, as they aid in the expulsion of the morbid products. Occasionally also they are administered when a foreign body has got into the larynx. Their use is contra-indicated in the case of anyone suffering from aneurism, hernia or arterio-sclerosis, or where there is any tendency to haemorrhage.

EMEU, evidently from the Port. Ema, a name which has in turn been applied to each of the earlier-known forms of Rattite birds, but has finally settled upon that which inhabits Australia, though, up to the close of the 18th century, it was given by most authors to the bird now commonly called cassowary—this last

word being a corrupted form of the Malayan Suwor (see Crawford, Gramm. and Dict. Malay Language, ii. pp. 178 and 25), apparently first printed as Cassarix by Bontius in 1658 (Hist. nat. et med. Ind. Orient. p. 71).

The cassowaries (Casuariidae) and emus (Dromaeidae)—as the latter name is now used—have much structural resemblance, and form the order Megastrans, which is peculiar to the Australian Region. Huxley showed (Proc. Zool. Soc., 1867, pp. 422, 423, that they agree in differing from the other Rattæ in many important characters; one of the most obvious of them is that

1 By Moraes (1796) and Sousa (1839) the word is said to be from the Arabic Na’dma or Na’dma, an ostrich (Struthio camelus); but no additional evidence in support of the assertion is given by Dozy in 1869 (Glossaire des mots espagnols et portugais dérivés de l'arabe, 2nd ed., p. 260). According to Gesner in 1555 (lib. iii. p. 709), it was the Portuguese name of the crane (Grus communis), and had been transferred with the qualifying addition of "di Ges" (i.e. ground-crane) to the ostrich. This statement is confirmed by Aldrovandus (lib. iv. cap. 2). Subsequently, but in what order can scarcely now be determined, the name was naturally enough used for the ostrich-like birds inhabiting the lands discovered by the Portuguese, both in the Old and in the New World. The last of these are now known as rheas, and the preceding as cassowaries.

2 The figures are taken, by permission, from Messrs. Mosenthal and Harting's Ostriches and Ostrich Farming (Trübner & Co., 1877).

Fig. 1.—Cassowary.
EMISSION EMILIA

each contour-feather appears to be double, its hyporachis, or after-shaft, being as long as the main shaft—a feature noticed in the case of either form so soon as examples were brought to
Europe. The external distinctions of the two families are,
however, equally plain. The cassowaries, when adult, bear a
horns helmet on their head; they have some part of the neck
bare, generally more or less ornamented with caruncles, and the
claws of the inner toe is remarkably elongated. The emus have
no helmet, their headdress, their neck has no caruncles,
and their inner toes bear a claw of no singular character.
The type of the Cassuariidae is the species named by Linnaeus
Struthio cassarius and by John Latham Cassuarius emeu. Viellot
subsequently called it C. galeatus, and his epitaph has been very
commonly adopted by writers, to the exclusion of the older
specific appellation. It seems to be peculiar to the island of
Ceram, and was made known to naturalists, as we learn from
Clusius, in 1597, by the first Dutch expedition to the East
Indies, when an example was brought from Banda, whither
it had doubtless been conveyed from its native island. It was
said to have been called by the inhabitants “Emu,” or “Emu,”
but this name they must have had from the earlier Portuguese
navigators. Since that time examples have been continually
imported into Europe, so that it has become one of the best-
known members of the subclass Ratitae. For a long time its
glossy, but coarse and hair-like, black plumage, its lofty helmet,
the gaudily-coloured caruncles of its neck, and the four or five
barbless quills which represent its wing-feathers, made it appear
unique among birds. But in 1857 Dr George Bennett certified
the existence of a second and perfectly distinct species of cassowary,
an inhabitant of New Britain, where it was known to the
natives as the Mooruk, and in his honour it was named by John
Gould C. bennetti. Several examples were soon after received
in England, and these confirmed the view of it already taken.
A considerable number of other species of the genus have since
been described from various localities in the same subregion.

1 It is known that the Portuguese preceded the Dutch in their
voyages to the East, and it is almost certain that the latter were
assisted by pilots of the former nation, whose names for places and
various natural objects would be imparted to their employers (see
Dodd).

Conspicuous among them from its large size and lofty helmet
is the C. australis, from the northern parts of Australia. Its
existence indeed had been ascertained, by T. S. Wall, in 1854,
but the specimen obtained by that unfortunate explorer was
lost, and it was not until 1867 that an example was submitted to
competent naturalists.

Not much seems to be known of the habits of any of the
cassowaries in a state of nature. Though the old species occurs
rather plentifully over the whole of the interior of Ceram, A. R.
Wallace was unable to obtain or even to see an example. They
all appear to bear captivity well, and the hens in confinement
frequently lay their dark-green and rough-shelled eggs, which,
according to the custom of the Ratitae, are incubated by the
cocks. The nestling plumage is mottled (Proc. Zool. Soc., 1863,
pl. xii.), and when about half-grown they are clothed in dis-
hevelled feathers of a deep tawny colour.

Of the emus (as the word is now restricted) the best known is
the Cassuarius novaehollandiae of John Latham, made by
Viellot the type of his genus Dromaeus, Whence the name of
the family (Dromaeidae) is taken. This bird immediately after
the colonization of New South Wales (1788) was found to inhabit
the south-eastern portion of Australia, where, according to
John Hunter (Hist. Journ., &c., pp. 409, 413), the natives call it
Marrung. However, it has not been so hunted down that not an example remains at large in the districts
that have been fully settled. It is said to have existed also on
the islands of Bass Straits and in Tasmania, but it has been
exterminated in both, without, so far as is known, any ornitho-
ologist having had the opportunity of determining whether the
race inhabiting those localities was specifically identical with
that of the mainland or distinct. Next to the ostrich the largest
of existing birds, the common emue is an inhabitant of the more
open country, feeding on fruits, roots and herbage, and generally
keeping in small companies. The nest is a shallow pit scraped
in the ground, and from nine to thirteen eggs, in colour varying
from a bluish-green to a dark-bottle-green, are laid therein.
These are hatched by the cock-bird, the period of incubation
lasting from 70 to 80 days. The young at birth are striped
longitudinally with dark markings on a light ground. A remark-
able structure in Dromaeus is a singular opening in the front of
the windpipe, communicating with a tracheal pouch. This has
attracted the attention of several anatomists, and has been
Various conjectures have been made as to its function, but it is
most probable of which seems to be that it is an organ of sound in the
breeding-season, at which time the hen-bird has long been
known to utter a remarkably loud booming note. Due conve-
nicence being afforded to it, the emue thrives well, and readily
propagates its kind in Europe. Like other Ratite birds it will
take to the water, and examples have been seen voluntarily
swimming a wide river.

(An N.)

EMISSION (from Lat. emigrare; e, ex, out of, and migra,
to depart), the movement of population out of one country
into another (see Migration).

EMILIA, a territorial division (compartimento) of Italy,
bounded by Venetia and Lombardy on the N., Liguria on the
W., Tuscany on the S., the Marches on the S.E., and the Adriatic
Sea on the E. It has an area of 7,657 sq. m., and a population
of 2,477,690 (1901), embracing eight provinces, as follows:

1. Bologna (pop. 526,612; 61 communes); 2. Ferrara (270,538;
16 communes); 3. Forli (283,996; 41 communes); 4. Modena
(329,598; 45 communes); 5. Parma (305,694; 50 communes);
6. Piacenza (350,491; 47 communes); 7. Ravenna (334,636;
18 provincial); 8. Reggio nell' Emilia (289,085; 43 communes).
In these provinces the chief towns, with communal populations,
are as follows:

1. Bologna (147,898), Imola (33,144), Budrio (17,577), S.
Giovanni in Persiceto (15,978), Castelfranco (13,484), Castel

8 The obvious misprint of Dromecus in this author's work
(Analysis, &c., p. 54) was foolishly followed by many naturalists,
forgetful that he corrected it a few pages farther on (p. 70) to
Dromacos—the properly latinized form of which is Dromicus.
EMILIA

S. Pietro (13,426), Medicina (12,573), Molinella (12,681), Crevalcore (11,408).
(2) Ferrara (86,675), Coppo (39,222), Argenta (20,474), Portomaggiore (20,141), Cento (19,078), Bondono (15,682), Comacchio (10,745).
(3) Forlì (43,321), Rimini (43,595), Cesena (42,509).
(4) Modena (63,012), Carpi (22,876), Miranda (13,721), Finale nell' Emilia (12,866), Pavullo nel Frignano (12,073).
(5) Parma (48,523), Borgo S. Donnino (12,019).
(6) Piacenza (35,047).
(7) Ravena (63,364), Faenza (39,757), Lugo (27,244), Bagno- cavallo (15,176), Brisighella (13,815), Alfonso (10,366).
(8) Reggio nell' Emilia (58,993), Correggio (14,445), Guastalla (11,091).

The northern portion of Emilia is entirely formed by a great plain stretching from the Via Aemilia to the Po; its highest point is not more than 200 ft. above sea-level, while along the E. coast are the lagoons at the mouth of the Po and those called the Valli di Comacchio to the S. of them, and to the S. again the plain round Ravena (10 ft.), which continues as far as Rimini, where the mountains come down to the coast.

Immediately to the S.E. of the Via Aemilia the mountains begin to rise, culminating in the central chain of the Ligurian and Tuscan Appennines. The boundary of Emilia follows the highest summits of the chain in the provinces of Parma, Reggio and Modena, passing over the Monte Bue (5915 ft.) and the Monte Cimone (7105 ft.), while in the provinces of Bologna and Forlì it keeps somewhat lower along the N.E. slopes of the chain. With the exception of the Po, the main rivers of Emilia descend from this portion of the Apennines, the majority of them being tributaries of the Po; the Trebbia (which rises in the province of Genoa), Taro, Secchia and Panaro are the most important. Even the Reno, Ronco and Montone, which now flow directly into the Adriatic, were, in Roman times, tributaries of the Po, and the Savio and Rubicone seem to be the only streams of any importance from these slopes of the Tuscan Apennines which ran directly into the sea in Roman times (see Apennines).

Railway communication in the plain of Emilia is unattended by engineering difficulties (except for the bridging of rivers) and is mainly afforded by the line from Piacenza to Rimini. This, as far as Bologna, forms part of the main route from Milan to Florence and Rome, while beyond Rimini it follows the S.E. coast of Italy past Ancona as far as Brindisi and Lecce. The description follows this main line in a S.E. direction. Piacenza, being immediately S. of a bridge over the Po, is an important centre; a line runs to the W. to Voghera, through which it communicates with the lines to the N. and the Adriatic, and thence, near the town of N. of the Po a line goes off to Cremona. A new bridge over the Po carries a direct line from Cremona to Borgo S. Donnino. From Parma starts a main line, followed by express lines from Milan to Rome, which crosses the Apennines to Spezia (and Sarzana, for Pisa and Rome), tunnelling under the pass of La Cisa, while in a N. and N.E. direction lines run to Brescia and Suzzara. From Reggio branch lines run to Guastalla, Carpi and Sassuolo, there being also a line from Sassuolo to Modena. At Modena the main line to Verona through Suzzara and Mantua diverges to the N.; there is also a branch N.N.E. to Miranda, and another S. to Vignola. Bologna is, however, the most important railway centre; besides the line S. to Pistoia and Florence over the Apennines and the line S.E. to Rimini, Ancona and Brindisi, there is the main line N.N.E. to Ferrara, Padua and Venice, and there are branches to Budrio and Portomaggiore to the N.E., and to S. Felice sul Panaro and Poggio Rusco to the N., which connect the main lines of the district.

At Castel Bolognese, 5 m. N.W. of Faenza, a branch goes off to Lugo, whence there are connexions with Budrio, Lavezzola (on the line between Ravenna and Ferrara) and Ravena, and at Faenza a line, not traversed by express trains, goes across the Apennines to Florence. Rimini is connected by a direct line with Ravenna and Ferrara; and Ferrara, besides the main line S.S.W. to Bologna and N. by E. to Padua, has a branch to Poggio Rusco, which goes on to Suzza, a station on the main line between Modena and Verona. There are also many steam tramways in the flatter part of the province, the fertility and agricultural activity of which are considerable. The main products of the plain are cereals, wine, and, in the marshy districts near the Po, rice; the system prevailing is that of the mezzadria—half the produce to the owner and half to the cultivator. The ancient Roman divisions of the fields are still preserved in some places. There are also considerable pastures, and cheese is produced, especially Parmesan. Flax, hemp and silk-worms are also cultivated, and a considerable quantity of poultry kept.

The hill districts produce cereals, vines, olives and fruit; while on the mountains are considerable chestnut and other forests, and extensive summer pastures, the flocks going in part to the Maremma in summer, and in part to the pastures of the plain of the Emilia.

The name Emilia comes from the Via Aemilia (q.v.), the Roman road from Ariminum to Placentia, which traversed the entire district from S.E. to N.W., its line being closely followed by the modern railway. The name was transferred to the district (which formed the eighth Augustan region of Italy) as early as the time of Martial, in popular usage (Epirg. vi. 85, 5), and in the 2nd and 3rd centuries it is frequently named as a district under imperial judges (iuridici), generally in combination with Flaminia or Liguria and Tuscia. The district of Ravena was, as a rule, from the 3rd to the 5th century, not treated as part of Aemilia, the chief town of the latter being Placentia. In the 4th century Aemilia and Liguria were joined to form a consular province; after that Aemilia stood alone, Ravena being sometimes temporarily added to it. The boundaries of the ancient district correspond approximately with those of the modern.

In the Byzantine period Ravena became the seat of an exarch; and after the Lombards had for two centuries attempted to subdue the Pentapolis (Ravenna, Bologna, Forlì, Faenza, Rimini), Pipin took these cities from Aistulf and gave them, with the March of Ancona, to the papacy in 755, to which, under the name of Romagna, they continued to belong. At first, however, the archbishop of Ravena was in reality supreme. The other chief cities of Emilia—Ferrara, Modena, Reggio, Parma, Piacenza—were, on the other hand, independent, and in the period of the communal independence of the individual towns of Italy each of the chief cities of Emilia, whether belonging to Romagna or not, had a history of its own; and, notwithstanding the feuds of Guelphs and Ghibellines, prospered considerably. The study of Roman law, especially at Bologna, acquired great importance. The imperial influence kept the papal power in check, but it was not until the 13th century that the Papacy established itself in the Emilia, which was then the chief portion of the duchy of Este, which had been formed from Padua and Ferrara in the formation of the duchy of Ferrara, and which was, from 1525, when it was divided between the Este and the Farnese, in possession of the Este, who, when sold it to the house of Este in 1710. Parma and Piacenza were at first under the Farnese, Pope Paul III. having placed his natural son Pier Luigi there in 1545, and then,
after the extinction of the family in 1731, under a secondary branch of the Bourbons of Spain. In 1766-1814, Emilia was first incorporated in the Italian republic and then in the Napoleonic Italian kingdom; after 1815 there was a return to the status quo ante, Romagna returning to the papacy and its ecclesiastical government, the duchy of Parma being given to Marie Louise, wife of the deposed Napoleon, and Modena to the archduke Francis of Austria, the heir of the last Este. In Romagna and Modena the government was oppressive, arbitrary, corrupt and unprogressive, while in Parma things were better. In 1821 and 1831 there were unsuccessful attempts at revolt in Emilia, which were sternly and cruelly repressed; chronic discontent continued and the people joined again in the movement of 1848-1849, which was crushed by Austrian troops. In 1859 the struggle for independence was finally successful, Emilia passing to the Italian kingdom almost without resistance.

EMINENCE (Lat. eminentia), a title of honour now confined to the cardinals of the Church of Rome. It was originally given as a complimentary title to emperors, kings, and then to less conspicuous persons. The Roman empire of the 4th century adopted, from the "varietas" of the East the forms and ceremonies of ostentatious greatness." Gibbon includes in the "profusion of epithets" by which "the purity of the Latin language was debased," and which were lavished on "the principal officers of the empire," "your Sincerity, your Gravity, your Excellency, your Eminence, your sublime and wonderful Magnitude, your illustrious and magnificent Highness." From the notitia dignitatum it passed into the Latin of the middle ages as a flattering epithet, and was applied in the church and by the popes to the dignified clergy at large, and sometimes as a pure form of civility to churchmen of modest rank. On the 10th of June 1630, Urban VIII. confined the use of the titles Eminentissimus et Eminentissimmus to the cardinals, to imperial electors, and to the master of the Hospital of St John of Jerusalem (order of the Knights of Malta). Since the dissolution of the Holy Roman Empire, and the entire change, if not actual destruction, of the order of St John, the title "eminence" has become strictly confined to the cardinals. Before 1630 the members of the Sacred College were "Illustriissimi" and "Reverendissimi." It is, therefore, not correct to speak of a cardinal who lived before that time as "his Eminence."

See du Cange, Glossarium mediae et infimae latinitatis (Niort and London, 1884), s.v. "Eminentia."

EMINENT DOMAIN (Lat. eminens, rising high above surrounding objects: and dominium, domain), a term applied in law to the sovereign right of a state to appropriate private property to public uses, whelh the owner consents or not. It is repeatedly employed by Grotius (e.g. De jure bell, bk. iii. c. 20, s. 7), Byynkershoek (Quaest. jur. pub. bk. 2, c. 15), and Puffendorf (De jure naturae et gentium, bk. i. c. 1, s. 19)—the two latter, however, preferring the word imperium ad dominium; and by other Dutch jurists. But in modern times it is chiefly in the United States of America that the doctrine of eminent domain has received its application, and it is chiefly to American law that the following remarks refer (see also the article COMPENSATION). Eminent domain is distinguishable alike from the police power, by which restrictions are imposed on private property in the public interest, e.g. in connexion with the liquor traffic or public health (see re Haaff (1904), 197 U.S. 488); from the power of taxation, by which the owner of private property is compelled to contribute a portion of it for public purposes; and from the war-power, involving the destruction of private property in the course of military operations. The police power fetters rights of property; eminent domain takes them away. The power of taxation is analogous to eminent domain as regards the purposes to which the contribution of the taxpayer is to be applied. But, unlike eminent domain, it does not necessarily involve a taking of specific property for those purposes. The destruction of property in military operations—or in the discharge by Government of other duties in cases of necessity, e.g. in order to check the progress of a fire in a city—clearly cannot be said to be an exercise of the power of eminent domain. The question whether the element of compensation is necessarily involved in the idea of eminent domain has in modern times aroused much controversy. According to one school of thought (see Lewis, Eminent Domain, s. 10), this question must be answered in the negative. According to a second, whose view has the support of the civilians (see Randolph, Eminent Domain, s. 227; Mills, Eminent Domain, s. 1) compensation is an inherent attribute of the power. An intermediate view is advocated by Professor Thayer (Cases on Constitutional Law, vol. 1, 1953), according to which eminent domain springs from the necessities of government, while the obligation to reimburse rests upon the natural right of individuals. The right to compensation is thus not a component part of the power to take, but arises at the same time and the latter cannot exist without it. The relation between the two is that of substance and shadow. The matter is not, however, of great practical importance, for the Federal Constitution prohibits the exercise of the power "without just compensation" (5th Amendment), while in most of the states the State constitution or other legislation has imposed upon it a similar limitation: and the tendency of modern judicial decisions is in favour of the view that the absence of such limitation will make an enactment so far unconstitutional and invalid.

In order to justify the exercise of the power of eminent domain, the purposes to which the property taken is to be applied must be "public," i.e. primarily public, and not primarily of private interest and merely incidentally beneficial to the public (Madisonville Traction Co. v. Mining Co., 1924, 196 U.S. 239). Subject to this definition, the term "public" receives a wide interpretation. All kinds of property may be taken; and the procedure indicated by the different legislatures must be followed. Any contravention of this rule would involve a breach of the 5th Amendment of the Federal Constitution, which provides that "no person . . . shall be deprived of . . . property, without due process of law." It may be added that if the performance of a covenant is rendered impossible by an act of eminent domain the covenantor is excused.

In English law, the only exact analogue to the doctrine of eminent domain is to be found in the prerogative right of the crown to enter upon the lands of subjects or to interfere with their enjoyment for the defence of the realm (see A. G. v. Tolmine (1879); 12 Ch. D. 214). No attempt is made to exercise this prerogative, and lands are acquired for state purposes by statute usually framed on or incorporating the Lands Clauses Acts (see COMPENSATION). The French Code Civil secures compensation to the owner of property in cases of expropriation pour cause d'utilite publique (art. 545), and there is similar provision in Belgium (Const. Law, art. II.), Holland (Fundamental Law, art. 147). Spain (Civil Code, art. 349, and Law of 3rd May, 1841), and most other European states. It has been held in France that the right to compensation does not arise under art. 354 of the Code Civil where only a servitude d'utilite publique is created on a private individual's land.

In addition to the authorities cited in the text, see Lewis, Eminent Domain (2nd ed., Chicago, 1900); Mills, Eminent Domain (2nd ed., St Louis, 1888); Randolph, Eminent Domain in the United States (Boston, 1894).

EMINESCU, MICHAL (1849-1889), the greatest Rumanian poet of the 19th century, was born on the 20th of December in Ipatessi near Botoshani, in the north of Moldavia. He was of Turco-Tatar origin, and his surname was originally Emin; this was changed to Eminovich and finally to the Rumanian form Eminescu. He was educated for a time in Czernowitz, and then entered the civil service. In 1864 he resumed his studies in Transylvania, but soon joined a roving theatrical company where he played in turn the roles of actor, prompter and stage-manager. After a few years he went to Vienna, Jena and Berlin, where he attended lectures, especially on philosophy. In 1874 he was appointed school inspector and librarian at the university of Jassy, but was soon turned out through the change of government, and took charge, as editor in chief, of the Conservative paper Timpul (Times). In 1883
EMIN PASHA

The next three or four years were employed by Emin in various journeys through his province, and in the initiation of schemes for its development, until in 1882, on his return from a visit to Khartoum, he became aware that the Mahdist rising, which had originated in Kordofan, was spreading southward. The effect of the rising was, of course, more markedly felt in Emin’s province after the abandonment of the Sudan by the Egyptian government in 1884. He was obliged to give up several of his stations in face of the Mahdist advance, and ultimately to retire from Lado, which had been his capital, to Wadelai. This last step followed upon his receipt of a letter from Nubur Pasha, informing him that it was impossible for the Egyptian government to send him help, and that he must stay in his province or retire towards the coast as best he could. Emin (who about this time was raised to the rank of pasha) had some thoughts of a retreat to Zanzibar, but decided to remain where he was and endeavour to hold his own. To this end he carried on protracted negotiations with neighbouring native potentates. When, in 1887, (Sir) H. M. Stanley’s expedition was on its way to relieve him, it is clear from Emin’s diary that he had no wish to leave his province, even if relieved. He had done good work there, and established a post which he believed himself able to maintain. He hoped, however, that the presence of Stanley’s force, when it came, would strengthen his position; but the condition of the relieving party, when it arrived in April 1888, did not seem to Emin to promise this. Stanley’s proposal to Emin, as stated in the latter’s diary, was that Emin should either remain as governor-general on behalf of the king of the Belgians, or establish himself on Victoria Nyanza on behalf of a group of English merchants who wished to start an enterprise in Africa on the model of the East India Company. After much hesitation, and prompted by a growing disaffection amongst the natives (owing, as he maintained, to his loss of prestige after the arrival of Stanley’s force), Emin decided to accompany Stanley to the interior. Emin arrived there unexpectedly, on the evening of a reception dinner given in his honour, Emin met with an accident which resulted in fracture of the skull. Careful nursing gradually restored him to health, and on his convalescence he resolutely maintained his decision to remain in Africa, and, if possible, to work there in future on behalf of the German government. The seal was definitely set upon this decision by his formal engagement on behalf of his native country, early in 1890. Preparations for a new expedition into the interior were set on foot, and meanwhile Emin was honoured in various ways by learned societies in Germany and elsewhere.

The object of the new expedition was (to quote Emin’s instructions) “to secure on behalf of Germany the territories situated south of and along Victoria Nyanza up to Albert Nyanza,” and to “make known to the population there that they were placed under German supremacy and protection, and to break or undermine Arab influence as far as possible.” The force which was well equipped, started at the end of April 1890. But before it had penetrated far inland the political reasons for sending the expedition vanished with the signature, on the 1st of July 1890, of the Anglo-German agreement defining the spheres of influence of the two nations, an agreement which excluded the Albert Nyanza region from the German sphere. For a time things went well enough with the expedition; Emin occupied the important town of Tabora on the route from the coast to Tanganyika and established the post of Bukoba on Victoria Nyanza, but by degrees ill-fortune clouded its prospects. Difficulties on the route; dissensions between Emin and the authorities in German East Africa, and misunderstandings on the part of both; epidemics of disease in Emin’s force, followed by a growing spirit of mutiny among his native followers; an illness of a painful nature which attacked him—all these gradually undermined Emin’s courage, and his diaries at the close of 1891 reflect a gloomy and almost hopeless spirit. In May the year he had crossed into the Congo State by the south shore of Albert Edward Nyanza, and many months were spent on the borders of the great Congo Forest and in the Undusuma country south-west of Albert Nyanza, breaking ground new to Europeans.
In December 1891 he sent off his companion, Dr Stuhlmann, with the bulk of the caravan, on the way back to the coast. Emin remained behind with the sick, and with a very reduced following left the lake district in March 1892 for the Congo river. On reaching Ipoto on the Ituri he came within the region of the Arab slave raiders and ivory hunters, in whose company he at times travelled. These gentry were incensed against Emin for the energetic way in which he had dealt with their comrades while in German territory, and against Europeans generally by the campaign for their suppression begun by the Congo State. At the instigation of one of these Arabs Emin was murdered on the 23rd or 24th of October 1892 at Kinena, a place about 80 m. E.S.E. of Stanley Falls.

See Emin Pasha, his Life and Work, by Georg Schweitzer, with introduction by R. W. Felkin (2 vols., London, 1898); Emin Pasha To Africa (London, 1888), a collection of Emin's papers contributed to scientific journals; and Mit Emin Pasha ins Herz von Afrika (Berlin, 1894), by Dr Franz Stuhlmann. Major G. Casati (1838-1902), an Italian officer who spent several years with Emin, accompanied him and gathered a number of experiences in Dicci anni in Equatoria (English edition, Ten Years in Equatoria and the Return with Emin Pasha, London, 1891).

EMLYN, THOMAS (1663-1741), English nonconformist divine, was born at Stamford, Lincolnshire. He served as chaplain to the presbyterian Letitia, countess of Donegal, and then to Sir Robert Rich, afterwards (1691) becoming colleague to Joseph Boysie, presbyterian minister in Dublin. From this office he was virtually dismissed on his own confession of unitarianism, and for publishing An Humble Inquiry into the Scripture Account of Jesus Christ (1702) was sentenced to a year's imprisonment and a fine of £1000. Thanks to the intervention of Boysie he was released in 1705 on payment of £50. He is said to have been the first English preacher definitely to describe himself as "unitarian," and writes in his diary, "I thank God that He did not call me to this lot of suffering till I had arrived at maturity of judgment. I have no design of resolution, and that He did not desert me when my friends did. I never let myself down to as to renounce the truth or to waver in my faith." Of Christ he writes, "We may regard with fervent gratitude so great a benefactor, but our esteem and rational love must ascend higher and not rest till it centre in God and ours." Emlyn preached a good deal in Paul's Alley, Barbican, in his later years, and died in London in 1741.

EMMANUEL, or IMMANUEL, a Hebrew symbolical proper name, meaning "God (is) with us." When in 734-735 B.C. Ahaz, king of Judah, alarmed at the preparations made against him by the Syro-ephraimitish alliance, was inclined to seek aid from Tiglath-pileser of Assyria, the prophet Isaiah endeavoured to allay his fear by telling him that the danger would pass away, and as a sign from Yahweh that this should be so, any young woman who should within the year bear a son, might call his name Immanuel in token of the divine protection accorded to Judah. For before the infant should come to even the immature intelligence of childhood the lands of the foe would be laid waste (Isaiah vii. 14-16). For other interpretations, especially as regards the mother, see Enc. Bib. col. 3162-3, and the commentaries. In the post-exilic period the historical meaning of the passage was forgotten, and a new significance was given to it in accordance with the gradually developing eschatological doctrine. This new interpretation finds expression in Matt. i. 23, where the name is applied to Jesus as the Messiah. At the close of Isaiah viii. 8 for "of thy land, O Immanuel," we should probably read "of the land, for God is with us." The three passages quoted are the only instances where this word occurs in Scripture; it is frequent in hymns and devotional literature as a title of Jesus Christ.

EMMANUEL PHILIBERT (1528-1580), duke of Savoy, son of Charles III. and Beatrice of Portugal, one of the most renowned princes of the later Renaissance, was born on the 8th of July 1528. Charles, after trying in vain to remain neutral in the wars between France and the emperor Charles V., had been forced to side with the latter, whereupon his duchy was overrun with foreign soldiery and became the battlefield of the rival armies. Prince Emmanuel took service with the emperor in 1545 and distinguished himself in Germany, France and the Low Countries. On the death of his father in 1553 he succeeded to the little, little more than an empty one, and continued in the emperor's service. Having been refused the command of the imperial troops in Piedmont, he tried in vain to negotiate a separate peace with France; but in 1556 France and Spain concluded a five years' truce, by which each was to retain what it then occupied. This would have been the end of Savoy, but within a year the two powers were again at war. The chief events of the campaign were the successful resistance of Cuneo, held for the duke by Count Luserna, and the victory of St Quentin (1557), won by Emmanuel Philibert himself against the French. At last in 1558 the powers agreed to an armistice, and in 1559 the peace of Cateau-Cambrésis was made, by which Emmanuel regained his duchy, but on onerous terms, for France was to occupy several Piedmontese fortresses, including Turin and Pinerolo, for not more than three years, and a marriage was arranged between the duke and Margaret, duchess of Berry, sister of the French king; while Spain was to garrison Asti and Vercelli (afterwards exchanged for Santhia) until France evacuated the above-mentioned fortresses. The peace took place in Paris a few months later; and after the French evacuation he re-entered his dominions amidst the rejoicings of the people. The condition of Piedmont at that time was deplorable; for wars, the exactions and devastations of the foreign soldiery, and religious antagonism between Catholics and Protestants had wrought terrible havoc. "Uncultivated," wrote the Venetian ambassador, quoted by E. Ricotti, "no citizens in the cities, neither man nor beast in the fields, all the land forest-clad and wild; one sees no houses, for most of them are burnt, and of nearly all the castles only the walls are visible; of the inhabitants, once so numerous, some have died of the plague or of hunger, some by the sword, and some have fled elsewhere preferring to beg their bread abroad rather than support misery at home which is worse than death." There was no army, the administration was chaotic, and the finances were in a hopeless state. The duc as set to work to put his house in order, and inaugurated a series of useful reforms, ably assisted by his minister, Nicolò Balbo. But progress was slow, and was accompanied by measures which abolished the states general, the last survival of feudal fealty. Savoy, following the tendency of the other states of Europe at that time, became thenceforth an absolute monarchy, but without that transformation the achievement of complete independence from foreign powers would have been impossible. One of the first questions with which he had to deal was the religious difficulty. The inhabitants of the Pellice and Chisone valleys had long professed a primitive form of Christianity which the orthodox regarded as heretical, and had been subject to numerous persecutions in consequence (see WALDENNES). At the time of the Reformation they had gone over to Protestantism, and during the wars of the 16th century the new religion made great progress in Piedmont. The duke as a devout Catholic desired to prevent the further progress of the heretical movements, and therefore proposed severe measures against the Waldenses, but after some severe and not very successful fighting he ended by allowing them a measure of religious liberty in those valleys (1561). At the pope's instigation he recommenced persecution some years later, but his duchess and some German princes pleaded successfully in favour of the Protestants. He next turned his attention to getting rid of the French garrisons; the negotiations proved long and troublesome, but in December 1562 the French departed on payment of 100,000 scudi, retaining only Pinerolo and Savigliano, and Turin became the capital once more. There remained the Bernese, who had occupied some of the duchy's territories in Savoy and Vaud, and in Geneva, over which he claimed certain rights. With Bern he made a compromise, retaining Gex, the Chablais, and the Genevois, on condition that Protestantism should be tolerated there, but he renounced Vaud and some other districts (1566). Disagreements with the Valais were settled in a similar way in 1569; but the Genevans refused to recognize Savoyard
suzerainty. Emmanuel reformed the currency, reorganized justice, prepared the way for the emancipation of the serfs, raised the standing army to 25,000 men, and fortified the frontiers, ostensibly against Huguenot raids, but in reality from fear of France. On the death of Charles IX. of France in 1574 the new king, Henry III., passed through Piedmont on his way from Poland; Emmanuel gave him a magnificent reception, and obtained from him a promise that Pinerolo and Savigliano should be evacuated, which was carried out at the end of the year. Philip of Spain was likewise induced to evacuate Asti and Santhià in 1575. Thus, after being more or less under foreign occupation for 39 years, the duchy was at last free. The duke rounded off his dominions by the purchase of Tenda and Oneglia, which increased his seaboard, and the last years of his life were spent in fruitless negotiations to obtain Monserrato, held by the Gonzagas under Spanish protection, and Saluzzo, which was a French fief. He died on the 30th of August 1580, and was succeeded by his son Charles Emmanuel I. As a statesman Emmanuel Philibert was able, business-like and energetic; but he has been criticized for his duplicity, although in this respect he was no worse than most other European princes, whose lives have been far from chaste. He was autocratic, but just and very patriotic. During his reign the duchy, which had been more than half French, became predominantly Italian. By diplomacy, which, although he was a capable and brave soldier, he preferred to war, he succeeded in freeing his country, and converting it from a ruined and divided land into a respectable independent power of the second rank, and, after Venice, the best-governed state in Italy.

The most accurate biography of Emmanuel Philibert is contained in E. Ricotti's Storia della monarchia Piemontese, vol. ii. (Florence, 1861), which is well done and based on documents; cf. Clarett's La Successione di Emanuele Filiberto (Turin, 1884).

**EMMAUS—EMMET**

1. A village mentioned by Luke (xxiv. 13), without any indication of direction, as being 60 stadia (almost 7 m.), or according to some MSS. 160 stadia, from Jerusalem. Its identification is a matter of mere guesswork: it has been sought at (a) Emmaus-Nicopolis (see below), distant 176 stadia from Jerusalem; (b) Kerjefel (or) Enab, distant 66 stadia, on the carriage road to Jericho; (c) Kerjefel (or) Enab, distant 66 stadia, on the same road; (d) el-Kubeibeh, distant 63 stadia, on the Roman road to Lydda; (e) Urtas, distant 60 stadia; and (f) Khurbet el-Khamasa, distant 86 stadia, on the Roman road to Eleutheropolis. Of these, el-Kubeibeh or 'Urtas seems the most probable, though many favours Kulonieh because of its nearness to Bet Mizza, in which name there is similarity with Emmaus, and because of a reading (30 stadia) in Josephus.

2. Emmaus-Nicopolis, now 'Amwâs, a town on the maritime plain, and a place of importance during the Maccabean and Jewish wars. Near it Judas Maccabaeus defeated Gogarias in 164 B.C., and Vespasian established a fortified camp in A.D. 69. It was afterwards rebuilt and named Nicopolis, and became an episcopal see. It was also noted for a healing spring.

**EMMENDINGEN,** a town of Germany, in the grand-duchy of Baden, close to the Black Forest, on the Elz and the main line of railway Mannheim-Constance. Pop. 6200. It has a Protestant church with a fine spire, a Roman Catholic church, a handsome town-hall, an old castle (now a hospital), the residence of the counts of Hochberg, spinning mills, tanneries and manufactures of photographic instruments, paper, machinery and cigars. There is also a considerable trade in timber and cattle. Here the author Johann Georg Schlosser (1739-1799), the husband of Goethe's sister Cornelia (who died in 1777 and is interred in the old graveyard), was Oberamtmann (bailli) for a few years.

1 Including Codex ℓ. But this distance is too great for the conditions of Luke's narrative and the reading (160) is evidently an attempt to harmonize with the traditional identification of Emmaus-Nicopolis held by Eusebius and Jerome. For a curious reading in three old Latin MSS. which makes Emmanuel the name of the second traveller on the journey, see Expos. Times, xiii. 429, 477, 561.

Emmendingen was formerly the seat of the counts of Hochberg, a cadet branch of the margraves of Baden. In 1418 it received market rights from the emperor, and in 1590 was raised to the status of a town, and walled, by Margrave Jacob III.

**EMMERICH** (the ancient Embriva), a town of Germany, in the Prussian Rhine province, on the right bank of the Rhine and the railway from Cologne to Amsterdam, 5 m. N.E. of Cleves. Pop. (1910) 12,578. It has a considerable shipping trade, and manufactories of tobacco and cigars, chocolate, margarine, oil, chemicals, brushes, vinegar, soap, guano and perfumery. There are also iron foundries and machine factories. The old minster church, built in the middle of the 11th century, contains some fine choir stalls.

Emmerich, formerly called Embrika and Emrik, originally a Roman colony, is mentioned in records so early as the 7th century. St Willibrord founded a monastery and church here. In 1233 the place came into the possession of the dukes of Gelderland and received the status of a town in 1247. In 1371 it fell to the duchy of Cleves, and passed with it in 1609 to Brandenburg. The town joined the Hanseatic League in 1407. In 1794 it was bombarded by the French under General Vandemarre, and in 1806 it was assigned to the grand-duchy of Berg. It passed into the possession of Prussia in 1815.

See A. Dederich, Annalen der Stadt Emmerich (Emmerich, 1867).

**EMMET, ROBERT** (1778-1803), Irish rebel, youngest son of Robert Emmet, physician to the lord-lieutenant of Ireland, was born in Dublin in 1778, and entered Trinity College in October 1793, where he had a distinguished academic career, showing special aptitude for mathematics and chemistry, and acquiring a reputation as an orator. Without taking a degree he removed his name from the college books in April 1798, as a protest against the inquisitorial examination of the political views of the students conducted by Lord Clare as chancellor of the university. Thus cut off from entering a learned profession, he turned towards political intrigue, being already to some extent in the secrets of the United Irishmen, of whom his elder brother Thomas Addis Emmet (see below) was one of the most prominent. In April 1799 a warrant was issued for his arrest, but he managed to escape; and in 1800 and the following year he travelled on the continent of Europe, where he entered into relations with the leaders of the United Irishmen, exiled since the rebellion of 1798, who were planning a fresh outbreak in Ireland in expectation of support from France. Emmet went to Paris in October 1802, where he had an interview with Bonaparte which convinced him that the peace of Amiens would be of short duration and that a French invasion of England might be looked for in August 1803. The councils of the conspirators were weakened by divided opinions as to the ultimate aim of their policy; and no clearly thought-out scheme of operations appears to have been arrived at when Emmet left Paris for Ireland in October 1802. Those in his confidence afterwards denied that Emmet was himself the originator of the plan on which he acted; and several of the abettors of the United Irishmen held aloof, believing the project to be impracticable. Among the latter was Lord Cloncurry, at one time on the executive of the United Irishmen, with whom Emmet dined the night before his arrest and to whom he spoke of his plans with intense enthusiasm and excitement. Emmet's lack of discretion was shown by his revealing his intentions in detail to an Englishman named Lawrence, resident near Honfleur, with whom he sought shelter when travelling on foot on his way to Ireland. Arriving in Dublin at the end of October he received information to the effect that seventeen counties were ready to take up arms if a successful effort were made in Dublin. For some time he remained concealed in his father's house near Miltown, making his preparations. A large number of pikes were collected and stored in Dublin during the spring of 1803, but fire-arms and ammunition were not plentiful.

The probability of a French invasion in August was increased by the renewal of the war in May, Emmet's brother Thomas being then in Paris in communication with Talleyrand and Bonaparte. But a discovery by the government of concealed
arms, and an explosion at one of Emmet’s depots in Patrick Street on the 16th of July, necessitated immediate action; and the 23rd of that month was accordingly fixed for the projected rising. An elaborate plan of operations, which he described in detail in a letter to his brother after his arrest, had been prepared by Emmet, the leading feature of which was a simultaneous attack on the castle, the Pigeon House and the artillery barracks at Island bridge; while bodies of insurgents from the neighbouring counties were to march on the capital. But the whole scheme miscarried. Some of Emmet’s bolder proposals, such as a plan for capturing the commander-in-chief, were vetoed by the timidity of his associates, none of whom were men of any ability. On the 23rd of July all was confusion at the depots, and the leaders were divided as to the course to be pursued; orders were not obeyed; a trusted messenger despatched for arms absconded with the money committed to him to pay for them; treachery, quite unsuspected by Emmet, honeycombed the conspiracy; the Wicklow contingent failed to appear; the Kilclare men turned back on hearing that the rising had been postponed; a signal expected by a contingent at the Broadstone was never given. In this hopeless state of affairs a false report reached Emmet at one of his depots at nine o’clock in the evening that the military were approaching. Without taking any step to verify it, Emmet put on a green and white uniform and placed himself at the head of some eighty men, who marched towards the castle, being joined in the streets by a second body of about equal strength. None of these insurgents had any discipline, and many of them were drunk. Lord Kilwarden, proceeding to a hastily summoned meeting of the privy council, was dragged from his carriage by this rabble and murdered, together with his nephew Richard Wolfe; his daughter who accompanied him being conveyed to safety by Emmet himself. Emmet, now seeing that the rising had become a mere street brawl, made his escape; a detachment of soldiers quickly dispersed his followers. After hiding for some days in the Wicklow mountains Emmet repaired to London, and in 1802 was at Harold’s Cross, in order to be near the residence of John Philip Curran (q.v.), to whose daughter Sarah he had for some time been secretly attached, and with whom he had carried on a volubulous correspondence, afterwards seized by the authorities at her father’s house. Attempting without success to persuade this lady to fly with him to America, Emmet lingered in the neighbourhood till the 25th of August, when he was apprehended by Major H. C. Sirr, the same officer who had captured Lord Edward Fitzgerald in 1798. At his trial he was defended and betrayed by the infamous Leonard MacNally (q.v.), and was convicted of treason; and after delivering an eloquent speech from the dock, was hanged on the 20th of September 1803.

By the universal testimony of his friends, Robert Emmet was a youth of modest character, pure motives and winning personality. But he was entirely lacking in practical statesmanship. Brought up in a revolutionary atmosphere, his enthusiasm was uncontrolled by judgment. Thomas Moore, who eulogizes Emmet, with whom he was a student at Trinity College, records that one day when he was playing on the piano the melody “Let Erin remember,” Emmet started up exclaiming passionately, “Oh, that I were at the head of 20,000 men marching to that air!” He had no knowledge of the world or of men; he trusted every one with child-like simplicity; except personal courage he had none of the qualities essential to leadership in such an enterprise as armed rebellion. The romance of his love affair with Sarah Curran—who afterwards married Robert Henry Sturgeon, an officer distinguished in the Peninsular War—has cast a glamour over the memory of Robert Emmet; and it inspired Thomas Moore’s well-known songs, “She is far from the land where her young hero sleeps,” and “Oh, breathe not his name”; it is also the subject of Washington Irving’s “The Broken Heart.” Emmet was short and slight in figure; his face was marked by smallpox, and he was described in 1803 for the purpose of identification as being “of an ugly, sour countenance and dirty brown complexion.” A few poems by Emmet of little merit are appended to Madden’s biography.

EMMET, THOMAS ADDIS (1764–1827), Irish lawyer and politician, second son of Robert Emmet, physician to the lord-lieutenant of Ireland, and elder brother of Robert Emmet (q.v.), the rebel, was born at Cork on the 24th of April 1764, and was educated at Trinity College, Dublin, and at Edinburgh University, where he studied medicine and was a pupil of Dugald Stewart in philosophy. After visiting the chief medical schools on the continent, he returned to Ireland in 1788; but the sudden death of his elder brother, Christopher Temple Emmet (1761–1788), a barrister of some distinction, induced him to follow the advice of Sir James Mackintosh to forsake medicine for the practice of law. He was called to the Irish bar in 1790, and rapidly rose to a place of principal influence as counsel for prisoners charged with political offences. He became the legal adviser of the leading United Irishmen. When the Dublin corporation issued a declaration of Protestant ascendancy in 1792, the counter-manifesto of the United Irishmen was drawn up by Emmet; and in 1795 he took the oath of the society in open court, becoming secretary in the same year and a member of the executive in 1797. Although Grattan had a profound contempt for Emmet’s political understanding, describing him as a quack in politics who set up his own crude notions as settled rules, Emmet was among the more prudent of the United Irishmen on the eve of the rebellion. It was only when convinced that parliamentary reform and Catholic emancipation were not to be obtained by constitutional methods, that he reluctantly engaged in treasonable conspiracy; and in opposition to bolder spirits like Lord Edward Fitzgerald, he disconntenanced the plan of an open rising of arms until help should be obtained from France. Though not among the leaders when taken at the house of Oliver Bond on the 12th of March 1798 (see FITZGERALD, LORD EDWARD), he was arrested about the same time, and he was one of the leaders who after the rebellion were imprisoned at Fort George till 1802. Being then released, he went to Brussels, where he was visited by his brother Robert in October of that year; and he was in the secrets of those who were preparing for a fresh rising in Ireland in conjunction with French aid. After the failure of Robert Emmet’s rising in July 1803, the news of which reached him in Paris, where he was in communication with Bonaparte, he emigrated to the United States. Joining the New York bar he obtained a lucrative practice and in 1812–13 was attorney-general of New York; his abilities and success being such that Judge Story declared him to be “by universal consent in the first rank of American advocates.” He died while conducting a case in court on the 14th of November 1827. Thomas Emmet married, in 1800, Jane, daughter of John Patten, of Clonmel. See authorities under EMMET, ROBERT.

EMMET, DANIEL DECATOR (1815–1904), American songwriter, was born at Mount Vernon, Ohio. He started the “negro minstrel” performances, which from 1842 onwards became so popular in America and England, and he composed a number of songs which had a great temporary vogue. He is remembered particularly as the writer of the famous Southern war-song “Dixie,” which he composed in 1859.

EMMITSBURG, a town in Frederick county, Maryland, U.S.A., 61 m. by rill W. by N. of Baltimore, and 11 m. S. of the northern boundary of the state. Pop. (1900) 849; (1910) 1054. It is served by the Emmitsburg railway (7 m. long) to Rocky Ridge on the Western Maryland railway. The town is
EMMIUS—EMMIUS

in a picturesque region on the eastern slope of the Blue Ridge Mountains. Two miles S.W. is Mount St. Mary's College (Roman Catholic), founded in 1808 by the Rev. John du Bois (1745-1842)—its president until 1826, when he became bishop of New York—and chartered by the state in 1830. The Ecclesiastical Seminary of the college has been a great training school, and has been called the "Nursery of Bishops"; among its graduates have been Bishop Hughes, Cardinal McCloskey and Archbishop Corrigan. In 1908 the college had 25 instructors and 350 students, of whom 57 were in the Ecclesiastical Seminary, and 61 in the Minim Department. Half a mile S. of the town is St Joseph's College and Academy (incorporated in 1816), for young women, which is conducted by the Sisters of Charity—this order was introduced into the United States at Emmitsburg by Mrs Elizabeth Ann Seton in 1809. The first settlement at Emmitsburg was made about 1773. It was at first called "Silver Fancy," and then for a time was known as "Poplar Fields"; but in 1786 the present name was adopted in honour of William Emmitt, one of the original settlers. The town was incorporated in 1824.

EMMIUS, UBBO (1547-1625), Dutch historian and geographer, was born at Gretha in East Friesland on the 5th of December 1547. After studying at Rostock, he spent two years in Geneva, with N. G. der Jacoby, and thence went to the Netherlands; in 1577 he was elected professor of history and Greek, and by his wise guidance and his learning speedily raised the new university to a position of eminence. He was on friendly terms with Louis, count of Nassau; corresponded with many of the learned men of his time; and died at Groningen on the 9th of December 1625. He was twice married, and left a son and a daughter. The chief works of Emmius are: Rerum Frisicarum historiae decades, in six parts, a complete edition of which was published at Leiden in 1616; Opus chronologicum (Groningen, 1619); Vetus Graecia illustrata (Leiden, 1626); and Historia temporis nostri, which was first published at Groningen in 1732. An account of his life, written by Nicholas Mullerus, was published, with the lives of other professors of Groningen, at Groningen in 1638.

See also Geschiedenis der letteren en wetenschappen in de Nederlandsen (The Hague, 1821-1826).

EMMONS, EBENEZER (1800-1863), American geologist, was born at Middlefield, Massachusetts, on the 16th of May 1800. He studied medicine at Albany, and after taking his degree practised for some years in Berkshire county. His interest in geology was kindled in early life, and in 1824 he had assisted Prof. Chester Dewey (1784-1857) in preparing a geological map of Berkshire county, in which the first attempt was made to classify the rocks of the Taconic area. While thus giving much of his time to natural science, undertaking professional work in natural history and geology in Williams College, he also accepted the professorship of chemistry and afterwards of obstetrics in the Albany Medical College. The chief work of his life was, however, in geology, and he has been designated by Jules Marcou as "the founder of American palaeozoic stratigraphy, and the first discoverer of the primordial fauna in any country." In 1836 he became attached to the Geological Survey of the State of New York, and after lengthened study he grouped the local wares under five great divisions, known as the Taconic system. The latter system was subdivided into several groups that were by no means well defined. Emmons had previously described the Potsdam sandstone (1838), and this was placed at the base of the New York system. It is now regarded as Upper Cambrian. In 1844 Emmons for the first time obtained fossils in his Taconic system: a notable discovery because the species obtained were found to differ from all then-known Palaeozoic fossils, and they were regarded as representing the primordial group. Marcou was thus led to advocate that the term Taconic be generally adopted in place of Cambrian. Nevertheless the Taconic fauna of Emmons has proved to include only the lower part of Sedgwick's Cambrian. Considerable discussion has taken place on the question of the Taconic system, and whether the term should be adopted; and the general opinion has been adverse. Emmons made contributions on agriculture and geology to a series of volumes on the natural history of New York. He also issued a work entitled American Geology; containing a statement of the principles of the Science, with full illustrations of the characteristic American Fossils (1855-1857). From 1851 to 1860 he was state geologist of North Carolina. He died at Brunswick, North Carolina, on the 1st of October 1863.

EMMONS, NATHANAEL (1745-1840), American theologian, was born at East Haddam, Connecticut, on the 20th of April 1745. He graduated at Yale in 1767, studied theology under the Rev. John Smalley (1734-1820) at Berlin, Connecticut, and was licensed to preach in 1769. After preaching four years in New York and New Hampshire, he became, in April 1773, pastor of the Second church at Franklin (until 1778 a part of Wrentham, Massachusetts), of which he remained in charge until his death. In his Day of Independence, he had been engaged in active ministerial cares. He lived, however, for many years thereafter, dying of old age at Franklin on the 23rd of September 1840. It was as a theologian that Dr Emmons was best known, and for half a century probably no clergyman in New England exerted so wide an influence. He developed an original system of divinity, somewhat on the structural plan of that of Samuel Hopkins, and, in Emmons's own belief, contained in and evolved from Hopkinianism. While by no means abandoning the tenets of the old Calvinistic faith, he came to be looked upon as the chief representative of what was then known as the "new school" of theologians. His system declared that holiness and sin are free voluntary exercises; that men act freely under the divine agency; that the slightest transgression deserves eternal punishment; that it is through God's mere grace that the penitent believer is pardoned and justified; that, in spite of total depravity, sinners ought to repent; and that regeneration is active, not passive, with the believer. Emmonsism was spread and perpetuated by more than a hundred clergymen, whom he personally trained. Politically, he was an ardent partisan of the War of Independence, and a strong Federalist afterwards, several of whose political discourses attracting wide attention. He was a founder and the first president of the Massachusetts Missionary Society, and was influential in the establishment of Andover Theological Seminary. More than two hundred of his sermons and addresses were published during his lifetime. His Works were published in 6 vols. (Boston, 1842; new edition, 1861).

See also the Memoir, by Dr E. A. Park (Andover, 1861).

EMPODECLES (c. 400-430 B.C.), Greek philosopher and statesman, was born at Agrigentum (Acragas, Girgenti) in Sicily of a distinguished family, then at the height of its glory. His grandfather Empedocles was victorious in the Olympic chariot race in 496; in 470 his father Meto was largely instrumental in the overthrow of the tyrant Thrasylaeus. We know almost nothing of his life. The numerous legends which have grown up round his name yield very little that can fairly be regarded as authentic. It seems that he carried on the democratic tradition of his house by helping to overthrow an oligarchic government which had been established in Agrigentum, and was invited by the citizens to become their king. That he refused the honour may have been due to a real enthusiasm for free institutions or to the prudential recognition of the peril which in those turbulent times surrounded the royal dignity. Ultimately a change in the balance of parties compelled him to leave the city, and he died in the Peloponnesse of the results of an accident in 430.

Of his poem on nature (φιλοσοφία) there are left about 400 lines in unequal fragments out of the original 5000; of the hymns of purification (καθαρισμός) less than 100 verses remain; of the
other works, improbably assigned to him, nothing is known. His grand but obscure hexameters, after the example of Parmenides, delighted Lucretius. Aristotle, it is said, called him the father of rhetoric. But it was as at once statesman, prophet, physician, and reformer that he most impressed the popular imagination. To his contemporaries, as to himself, he seemed more than a mere man. The Sicilians honoured his august aspect as he moved amongst them with purple robes and golden girdle, with long hair bound by a Delphic garland, and brazen sandals on his feet, and with a retinue of slaves behind him. Stories were told of the ingenuity and generosity by which he had made the marbles round Selinus salubrious, of the grotesque device by which he laid the winds that ruined the harvests of Agrigentum, and of the almost miraculous restoration to life of a woman who had long lain in a death-like trance. Legends stranger still told of his disappearance from among men. Empedocles, according to one story, was one midnight, as a feast held in his honour, called away in a blaze of glory to the gods; according to another, he had only thrown himself into the crater of Etna, in the hope that men, finding no traces of his end, would suppose him translated to heaven. But his hopes were cheated by the volcano, which cast forth his brazen sandals and betrayed his secret (Diog. Laërt. viii. 67). The people of Agrigentum have never ceased to honour his name, and even in modern times he has been celebrated by followers of Mazzini as the democrat of antiquity par excellence.

As his history is uncertain, so his doctrines are hard to put together. He does not belong to any one definite school. While, on one hand, he combines much that had been suggested by Parmenides, Pythagoras and the Ionic schools, he has germs of truth that Plato and Aristotle afterwards developed; he is at once a firm believer in Orphic mysteries, and a scientific thinker, precursor of the physical scientists. There are, according to Empedocles, four ultimate elements, four primal changes, of which are made all structures in the world—fire, air, water, earth. These four elements are eternally brought into union, and eternally parted from each other, by two divine beings or powers, love and hatred—an attractive and a repulsive force which the ordinary eye can see working amongst men, but which really pervade the whole world. According to the different proportions in which these four indestructible and unchangeable matters are combined with each other is the difference of the organic structure produced; e.g. flesh and blood are made of equal (in weight but not in volume) parts of all four elements, whereas bones are one-half fire, one-fourth earth, and one-fourth water. It is in the aggregation and segregation of elements thus arising that Empedocles, like the atomists, finds the real process which corresponds to what is popularly termed growth, increase or decrease. Nothing new comes or can come into being; the only change that can occur is a change in the juxtaposition of element with element.

Empedocles apparently regarded love (φιλονησία) and discord (φιλονησία) as alternatives holding the empire over things,—neither, however, being ever quite absent. As the best and original state, he seems to have conceived a period when his elements were dominant, and all the elements formed one great sphere or globe. Since that period discord had gained more and more ground, and the actual world was full of contrasts and oppositions, due to the combined action of both principles. His theory attempted to explain the separation of elements, the formation of earth and sea, of sun and moon, of atmosphere. But the most interesting and most matured part of his views dealt with the first origin of plants and animals, and with the physiology of man. As the elements (his deities) entered into combinations, there appeared quiant results—heads without necks, arms without shoulders. Then as these fragmentary structures met, there were seen horned heads on human bodies, bodies of oxen with men's heads, and figures of double sex. But most of these products of natural forces disappeared as suddenly as they arose; only in those rare cases where the several parts were found adapted to each other, and casual member fitted into casual member, did the complex structures thus formed last. Thus from spontaneous aggregations of casual aggregates, which suited each other as if this had been intended, did the organic universe originally spring. Soon various influences reduced the creatures of double sex to a male and a female, and the world was replenished with organic life. It is impossible not to see in this theory a crude anticipation of the "fittest" theory of modern evolutionists.

As man, animal and plant are composed of the same elements in different proportions, there is an identity of nature in them all. They all have sense and understanding; in man, however, and especially in the blood at his heart, mind has its peculiar seat. But mind is always dependent upon the body, and varies with its changing constitution. Hence the precepts of morality are with Empedocles largely dietetic.

Knowledge is explained by the principle that the several elements in the things outside us are perceived by the corresponding elements in ourselves. We know only in so far as we have within us a nature cognate to the object of knowledge. Like is known by like. The whole body is full of pores, and hence respiration takes place over the whole frame. But in the organs of sense these pores are specially adapted to receive the effluves which are continually rising from bodies around us; and in this way perception is somewhat obscurely explained. The theory, however unsatisfactory as an explanation, has one great merit, that it recognizes between the eye, for instance, and the object seen an intermediate something. Certain particles go forth from the eye to meet similar particles given forth from the object, and the resultant contact constitutes vision. This idea contains within it the germ of the modern idea of the subjectivity of sense-given data; perception is not merely a passive reflection of external objects.

It is not easy to harmonize these quasi-scientific theories with the theory of transmigration of souls which Empedocles seems to expound. Probably the doctrine that the divinity (δησμος) passes from element to element, nowhere finding a home, is a mystical way of teaching the continued identity of the principles which are at the bottom of every phase of development from inorganic nature to man. At the top of the scale are the prophet and the physician, those who have best learned the secret of life; they are next to the divine. One law, an identity of elements, pervades all nature; existence is one from end to end; the plant and the animal are links in a chain where man is a link too; and even the distinction between male and female is transcended. The beasts are kindred with man; he who eats their flesh is not much better than a cannibal.

Looking at the opposition between these and the ordinary opinions, we are not surprised that Empedocles notes the limitation and narrowedness of human perceptions. We see, he says, but a part, and fancy that we have grasped the whole. But the senses cannot lead to truth; thought and reflection must look to the thing on every side. It is the business of a philosopher, while he lays bare the fundamental difference of elements, to display the identity that subsists between what seem unconnected parts of the universe.

(Edward W. X.)

EMPEROR (Fr. empereur, from the Lat. imperator), a title formerly borne by the sovereigns of the Roman empire (see Empire), and since their time, partly by derivation, partly by imitation, used by a variety of other sovereigns. Under the Republic, the term imperator applied in theory to any magistrate
vested with imperium; but in practice it was only used of a
magistrate who was acting abroad (militiae) and was thus in
command of troops. The term imperator was the natural and
regular designation employed by his troops in addressing such a
magistrate; but it was more particularly and specially employed
by them to salute him after a victory; and when he had been
thus saluted he could use the title of imperator in public till the
day of his triumph at Rome, after which it would lapse along
with his imperium. The senate itself might, in the later Republic,
invite a victorious general to assume the title; and in these two
customs—the salutation of the troops, and the invitation of the
senate—we see in the germ the two methods by which under the
Empire the princeps was designated; while in the military
connotation attaching to the name even under the Republic we
can detect in advance the military character by which the emperor and the Empire were afterwards distinguished. Julius
Caesar was the first who used the title continuously (from 58 B.C.
to his death in 44 B.C.), as well domi as militiae; and his nephew
Augustus took a further step when he made the term imperator a praenomen, a practice which after the time of Nero becomes
regular. But apart from this an emperor of the term with his
regular name, and the private right to its use which that
bestowed, every emperor had an additional and double right to
the title on public grounds, possessed as he was of an imperium
infinitum majus, and commanding as he did all the troops of the
Empire. From the latter point of view—as generalissimo of
the forces of Rome, he had the right to the insignia of the com-
mander (the laurel wreath and the fasces), and to the protection
of a bodyguard, the praetorians. This public title of imperator
was normally conferred by the senate; and an emperor normally
dates his reign from the day of his salutation by the senate.
But the troops were also regarded as still retaining the right of
saluting an imperator; and there were emperors who regarded
themselves as created by such salutation and dated their reigns accordingly. The military associations of the term thus resulted,
only too often, in making the emperor the nominee of a turbulent
soldiery.

Augustus had been designated (not indeed officially, but none
the less regularly) as princeps—the first citizen or foremost man
of the state. The designation suited the early years of the
Empire, in which a dyarchy of princeps and senate had been
maintained. But by the 2nd century the dyarchy is passing
into a monarchy: the title of princeps recedes, and the title
of imperator comes into prominence to designate not merely
the possessor of a certain imperium, or the general of troops, but
the simple monarch in the fullness of his power as head of the state.
From the days of Diocletian one finds occasionally two emperors,
but not, at any rate in theory, two Empires; the two emperors
are the dual sovereigns of a single realm. But from the time of
Arcadius and Honorius (A.D. 395) there are in reality (though
not in theory) two Empires as well as two emperors, one of the
East and one of the West. When Greek became the sole language
of the East Roman Empire, imperator was rendered sometimes
by basileus and sometimes by αυτοκράτωρ, the former word
being the usual designation of a sovereign, the latter specially
denoting that despotic power which the imperator held, and being
the fact the official translation of imperator. Justinian uses αυτοκράτωρ as his formal title, and basileus as the popular

On the revival of the Roman empire in the West by charle-
magne in 800, the title (at first in the form imperator, or imperator
Augustus, afterwards Romanorum imperator Augustus) was taken
by him and by his Frankish, Italian and German successors,
heads of the Holy Roman Empire, down to the abdication of
the emperor Francis II. in 1806. The doctrine had, however,
grown up in the earlier middle ages (about the time of the emperor
Henry II., 1002-1024) that although the emperor was chosen
in Germany (at first by the nation, afterwards by a small body
of electors), and entitled from the moment of his election to be
crowned in Rome by the pope, he could not use the title of
emperor until that coronation had actually taken place. The
German sovereign, therefore, though he exercised, as soon as
chosen, full imperial powers both in Germany and Italy, called
himself merely "king of the Romans" (Romanorum rex semper
Augustus) until he had received the sacred crown in the sacred
city. In 1508 Maximilian I. being refused a passage to Rome
by the Venetians, obtained from Pope Julius II. a bull permitting
him to style himself emperor elect (imperator electus, erwählter
Kaiser). This title was taken by Ferdinand I. (1558) and all
successing emperors, immediately upon their coronation in
Germany; and it was until 1806 their strict legal designation,
and was always employed by them in proclamations and other
official documents. The term "elect" was, however, omitted
even in formal documents when the sovereign was addressed
or was spoken of in the third person.

In medieval times the emperor, conceived as viceregent of
God and co-regent with the pope in government of the Christian
people committed to his charge, might almost be regarded as
an ecclesiastical officer. Not only was his function regarded
as consisting in the defence and extension of true religion;
he was himself arrayed in ecclesiastical vestments at his corona-
ition; he was ordained a subdeacon; and admitting the pope
in the celebration of the Eucharist, he communicated in both
kinds as a clerk. The same sort of ecclesiastical character came
also to be attached to the tsars of Russia, who—especially
in their relations with the Orthodox Eastern Church—may
vindicate for themselves (though the sultans of Turkey have
disputed the claim) the succession to the East Roman emperors
(see Empire). But the title of emperor was also used in the
middle ages, and is still used, in a loose and vague sense, without
any ecclesiastical connotation or hint of connexion with Rome
(the two attributes, which should properly distinguish an
emperor), and merely in order to designate a non-European
ruler with a large extent of territory. It was thus applied,
and is still applied, to the rulers of China and Japan; it was
attributed to the Mogul sovereigns of India; and since 1876
it has been used by British monarchs in their capacity of
sovereigns of India (Kaiser-i-Hind).

Since the French Revolution and during the course of the
19th century, the term emperor has had an eventful history.
In 1804 Napoleon took the title of "Emperor of the French,"
and posed as the revival of the Empire of Charlemagne. Afraid
that Napoleon would next proceed to deprive him of his title
of Holy Roman Emperor, Francis II. first took the step, in 1804,
of investing himself with a new title, that of "Hereditary Emperor
of Austria," and then, in 1806, proceeded to the further step of
abdicating his old historical title and dissolving the Holy Roman
Empire. Thus the old and true sense of the term emperor—the
sense in which it was connected with the church in the present
and with Rome in the past—finally perished; and the term
became partly an anapanage of Bonapartism (Louis Napoleon
resuscitated it as Napoleon III. in 1853), and partly a personal
title of the Habsburgs as rulers of their various family territories.
In 1870, however, a new and most important use of the title
was begun, when the union of Germany was achieved, and the
French king, who became the head of united Germany, received
in that capacity the title of German Emperor. Here the title
of emperor again designates the president of a federal state; and here
the Holy Roman fact that a federal state, no matter how loose
the president of a loose confederation of German states, may be said
to have found his successor. But the term has been widely and

1 The word Tsar, like the German Kaiser, is derived from Caesar
(see Tsar). The Great introduced the use of the style "Im-
peratort and the official designation is now "Empire of all the
Tsar of Poland and Grand Duke of Finland," though the
term tsar is still popularly used in Russia.

2 For the titles of basileus, imperator Augustus, &c., applied in the
10th century to the Anglo-Saxon kings, see Empire (note). The
claim to the style of emperor, as a badge of equal rank, played a
considerable part in the diplomatic relations between the Sultan
and certain European sovereigns. Thus, at a time when this style
(Padishah) was refused by the Sultan to the tsars of Russia, and
even to the Holy Roman Emperor himself, it was allowed to the
French kings, who in diplomatic correspondence and treaties with
Turkey called themselves "emperor of France" (emper目标任务

loosely used in the course of the 19th century. It was the style from 1821 to 1889 of the princes of the house of Braganza who ruled in Brazil; it has been assumed by usurpers in Haiti, and in Mexico it was borne by Augustin Iturbide in 1822 and 1823, and by the ill-fated Archduke Maximilian of Austria from 1864 to 1867. It can hardly, therefore, be said to have any definite descriptive force at the present time, such as it had in the middle ages. So far as it has any such force in Europe, it may be partly to be connected with Bonapartism, and to denote a popular but military dictatorship, partly to be connected with the federal idea, and to denote a precedence over other kings possessed by a ruler standing at the head of a composite state which may embrace kings among its members. It is in this latter sense that it is used of Germany, and of Britain in respect of India; it is in something approaching this latter sense that it may be said to be used of Austria.

See J. Selden, Titles of Honour (1672); J. Bryce, Holy Roman Empire (London, 1909); and Sir E. Colebrooke, On Imperial and Other Titles in the Journal of the Royal Asiatic Society (1877). See also the articles on "Imperator" and "Princeps" in Smith's Dictionary of Greek and Roman Antiquities (1890).

**EMPHYSEMA** (Gr. ἐμφύσεως to inflate) is a word vaguely meaning the abnormal presence of air in certain parts of the body. At the present day, however, there are two conditions to which it refers, "pulmonary emphysema" (and the word pulmonary is often omitted) and "surgical emphysema." Of pulmonary emphysema there are two forms, true vesicular and interstitial (or interlobar). Vesicular emphysema signifies that there is an enlargement of air-vesicles, resulting either from their excessive distension, from destruction of the septa, or from both causes combined (see RESPIRATORY SYSTEM). In interstitial emphysema the air is infiltrated into the connective tissue beneath the pleura and between the pulmonary air-cells.

The former variety is by far the more common, and appears to be capable of being produced by various causes, the chief of which are the following:—

1. Where a portion of the lung has become wasted, or its vesicular structure permanently obliterated by disease, without corresponding falling in of the chest wall, the neighbouring air-vesicles or some of them undergo dilatation to fill the vacuum (vicarious emphysema).

2. In some cases of bronchitis, where numbers of the smaller bronchial tubes become obstructed, the air in the pulmonary vesicles remains imprisoned, the force of expiration being insufficient to expel it; while, on the other hand, the stronger force of inspiration being adequate to overcome the resistance, the air-cells tend to become more and more distended, and permanent alterations in their structure, including emphysema, are the result (inspiratory theory).

3. Emphysema also arises from exertion involving violent expiratory efforts, during which the glottis is constricted, as in paroxysms of coughing, in straining, and in lifting heavy weights (expiratory theory). Whooping-cough is well known as the exciting cause of emphysema in many persons.

4. Another view, known as the nutritive theory, maintains that emphysema depends essentially on a primary nutritive change in the walls of the air-vesicles. Thus these are impaired in their resisting power, and are far more likely to become distended by any force acting on them from within.

5. Again in certain cases the cartilages of the chest become hypertrophied and rigid, thus causing a primary chronic enlargement, and the lungs become emphysematous in order to fill up the increased space (Fraud's theory).

In whatever manner produced, this disease gives rise to important morbid changes in the affected portions of the lungs, especially the loss of the natural elasticity of the air-cells, and likewise the destruction of many of the pulmonary capillary blood-vessels, and the diminution of aerating surface for the blood. As a consequence an increased strain is thrown on the right ventricle with a consequent dilatation leading on to heart failure and all its attendant troubles. The chief symptom in this complaint is shortness of breath, more or less constant but greatly aggravated by exertion, and by attacks of bronchitis, to which persons suffering from emphysema appear to be specially liable. The respiration is of similar character to that already described in the case of asthma. In severe forms of the disease the patient comes to acquire a peculiar path for blown appearance, and the configuration of the chest is altered, assuming the character known as the barrel-shaped or emphysematous chest.

The main element in the treatment of emphysema consists in attention to the general condition of the health, and in the avoidance of all causes likely to aggravate the disease or induce its complications. Compressed air baths and expiration into rarefied air may be useful. During attacks of urgent dyspnoea and lividity, with engorgement of veins, the patient should be repeatedly bled until relief is obtained. Interstitial emphysema arising from the rupture of air-cells in the immediate neighbourhood of the pleura may occur as a complication of the vesicular form, or separately as the result of some sudden expulsive effort, such as a fit of coughing, or, as has frequently happened, in parturition. Gangrene or post-mortem decomposition may lead to the presence of air in the interstitial tissue of the lung. Occasionally the air infiltrates the cellular tissue of the posterior mediastinum, and thence comes to distend the integument of the whole surface of the body (surgical emphysema). Surgical emphysema signifies the effusion of air into the general connective tissues of the body. The commonest causes are a wound of some air-passage, or a penetrating wound of the chest wall without injury to the lung. It may, however, occur in any situation of the body and in many other ways. Its severity varies from very slight cases where only a little crepitation may be felt under the skin, to extreme cases where the whole body is blown up and death is imminent from impeded respiration and failure of the action of the heart. In the milder cases no treatment is necessary as the air gradually becomes absorbed, but in the more severe cases incisions must be made in the swollen cellular tissues to allow the air to escape.

**EMPIRE**, a term now used to denote a state of large size and also (as a rule) of composite character, often, but not necessarily, ruled by an emperor—a state which may be a federation, like the German empire, or a unitary state, like the Russian, or even, like the British empire, a loose compound of free states united to a number of subordinate dependencies. For many centuries the writers of the Church, basing themselves on the Apocalyptic writings, conceived of a cycle of four empires, generally explained—though there was no absolute unanimity with regard to the members of the cycle—as the Assyrian, the Persian, the Macedonian and the Roman. But in reality the conception of Empire, like the term itself (Lat. imperium), is of Roman origin. The empire of Alexander had indeed in some ways anticipated the empire of Rome. "In his later years," Professor Bury writes, "Alexander formed the notion of an empire, both European and Asiatic, in which the Asiaties should not be dominated by the European invaders, but Europeans and Asiaties alike should be ruled on an equality by a monarch, indifferent to the distinction of Greek and barbarian, and looked upon as their own king by Persians as well as by Macedonians." The dominant Hellenic-Cyrenean philosophy of cosmopolitanism harmonized with this notion, as Stoicism did later with the practice of the Roman empire; and Alexander, like Diocletian and Constantine, accustomed a Western people to the forms of an Oriental court, while, like the earlier Caesars, he claimed and received the recognition of his own divinity. But when he died in 323, his empire, which had barely lasted ten years, died with him; and it was divided among Diadochi who, if in some other respects (for instance, the Hellenization of the East) they were heirs of their master's policy, were destitute of the imperial conception. The work of Alexander was rather that of the forerunner than the founder. He prepared the way for the world-empire of Rome; he made possible the rise of a universal religion. And these are the two factors which, throughout the middle ages, went together to make the thing which men called Empire.
At Rome the term imperium signified generally, in its earlier use, the sovereignty of the state over the individual, a sovereignty which the Romans had disengaged with singular clearness from all other kinds of authority. Each of the higher magistrates of the Roman people was vested, by a lex curiata (for power was distinctly conceived as resident in, and delegated by, the community), with an imperium both civil and military, which varied in degree with the magnitude of his office. In the later days of the Republic such imperium was enjoyed, partly in Rome by the resident consuls and praetors, partly in the provinces by the various procurors or praeproctores. There was thus a certain morcellement of imperium, delegated as it was by the people to a number of magistrates; the coming of the Empire meant the re-integration of this imperium, and its unification, by a gradual process, in the hands of the princeps, or emperor.

The means by which this process was achieved had already been anticipated under the Republic. Already in the days of Pompey it had been found convenient to grant to an extraordinary officer for imperium aecuem or magnum over a large area, and that officer thus received powers, within that part of Italy, equal, if not greater, than, the powers of the provincial governors. This precedent was followed by Augustus in the year 27 B.C., when he acquired for himself sole imperium in a certain number of provinces (the imperial provinces), and an infinitum imperium majus in the remaining provinces (which were termed senatorial). As a result, Augustus enjoyed an imperium coextensive indeed with the whole of the Roman world, but concurrent, in part of that world, with the imperium of the senatorial procurors; and the early Empire may thus be described as a dyarchy. But the distinction between imperial and senatorial provinces finally disappeared; by the time of Constantine the emperor enjoyed sole imperium, and an absolute monarchy had been established.

We shall not, however, fully understand the significance of the Roman Empire, unless we realize the importance of its military aspect. All the soldiers of Rome had from the first to swear in serva Caesaris Augusti; and thus the whole of the Roman army was his army, regiments of which he might indeed lend, but of which he was sole Imperator (see under Emperor).

Thus regarded as a permanent command-in-chief, the emperor enjoyed the privileges, and suffered the weaknesses, of his position. He had the power of the sword behind him; but he became more and more liable to be deposed, and to be replaced by a new commander, at the will of those who bore the sword in his service.

The period which is marked by the reigns of Diocletian and Constantine (A.D. 284-337) marks a great transformation in the character of the Empire. The old dyarchy, under which the emperor might still be regarded as an official of the respublica Romana, passed into a new monarchy, in which all political power became, as it were, the private property of the monarch. There was now no distinction of provinces; and the old public aerarium became merely a municipal treasury, while the fiscus of the emperor became the exchequer of the Empire. The officers of the imperial praetorium, or bodyguard, are now the great officers of state; his private council becomes the public consistory, or supreme council of appeal; and the consules of his court are the administrators of his empire. "All is in him, and all comes from him," as our own year-books say of the medieval king; his household, for instance, is not only a household, but also an administration.

On the other hand, this unification seems to be accompanied by a new bifurcation. The exigencies of frontier defence had long been drawing the Empire towards the troubled East; and this tendency reached its culmination when a new Rome arose by the Bosporus, and Constantinople became the centre of what seemed a second Empire in the East (A.D. 324). Particularly after the division of the Empire between Arcadius and Honorius in 395 does this bifurcation appear to be marked; and one naturally speaks of the two Empires of the West and the East. Yet it cannot be too much emphasized that in reality such language is utterly inexact. The Roman Empire was, and always continued to be, ideally one and indivisible. There were two emperors, but one Empire—two persons, but one person. The point is of great importance for the understanding of the use of the middle ages: there only is, and can be, one Empire, which may, indeed, for convenience, be ruled conjointly by two emperors, resident, again for convenience, in two separate capitals. And, as a matter of fact, not only did the residence of an emperor in the East not spell bifurcation, it actually fostered the tendency towards unification. It helped forward the transformation of the Empire into an absolute and quasi-Asianic monarchy, under which all its subjects fell into a single level of local submission; it helped to give the emperor a gorgeous court, marked by all the ceremony and the servility of the East. The deification of the emperor himself dates from the days of Augustus; by the time of Constantine it has infected the court and the government.

Each emperor, again, had from the first enjoyed the sacrosanct position which was attached to the tribunate; but now his palace, his chamber, his charities, his letters, are all "sacred," and one might almost speak in advance of a "Holy Roman Empire." But there is one factor, the greatest of all, which still remains to be considered, before we have counted the sum of the forces that made the world think in terms of Empire for centuries to come; and that is the reception of Christianity into the Empire by Constantine. That reception added a new sanction to the existence of the Empire and the position of the emperor. The Empire, already one and indivisible in its aspect of a political society, was welded still more firmly together when it was informed and permeated by a common Christianity, and unified by the force of a spiritual bond. The Empire was now the Church; it was now indeed indestructible, for, if it perished as an empire, it would live as a church. But the Church made it certain that it would not perish, even as an empire, for many centuries to come. On the one hand the Church thought in terms of empire and taught the millions of its disciples (including the barbarians themselves) to think in the same terms. No other political conception—no conception of a sultana or of a nation—was any longer possible. When the Church gained its hold of the Roman world, the Empire, as it has been well said, was already "not only a government, but a fashion of conceiving the world"; it had stood for three centuries, and could not think of any other form of political association. Moreover, the gospel of St. Paul—that there is one Church, whereof Christ is the Head, and we are members—could not but reinforce for the Christian the conception of a necessary political unity of all the world under a single head. Uno Chiesa in uno Stato—such, then, was the theory of the Church.

But not only did the Church perpetuate the conception of empire by making it a part of its own theory of the world: it perpetuated that conception equally by materializing it in its own organization of itself. Growing up under the shadow of the Empire, the Church too became an empire, as the Empire had become a church. As it took over something of the old pagan ceremonial, so it took over much of the old secular organization. The pope borrowed his title of pontifex maximus from the emperor: what is far more, he made himself gradually, and in the course of centuries, the Caesar and Emperor of the Church. The offices and the dioceses of the Church are parallel to the offices and dioceses of the Diocletian empire: the whole spirit of orderly hierarchy and regular organization, which breathed in the Roman Church, is the heritage of ancient Rome. The Donation of Constantine is a forgery; but it expresses a great truth when it represents Constantine as transferring the pope the imperial palace and insignia, and to the clergy the ornaments of the imperial army (see Donation of Constantine).

1 Bryce points out, with much subtilty and truth, that the rise of a second Rome in the East not only helped to perpetuate the Empire by providing a new centre which would take the place of Rome when Rome fell, but also tended to make it more universal; for, having lost its local centre, it subsisted no longer by historic right only, but, so to speak, naturally, as a part of an order of things which a change in external conditions seemed incapable of disturbing (Holy Roman Empire, p. 8 of the edition of 1904).
Upon this world, informed by these ideas, there finally descended, in the 5th century, the avalanche of barbaric invasion.

The Barbarian invasions.

Its impact seemed to split the Empire into fragmentary kingdoms; yet it left the universal Church intact, and with it the conception of empire. With that conception, indeed, the barbarians had already been for centuries familiar: service in Roman armies, and settlement in Roman territories, had made the Roman empire for them, as much as for the civilized provincial, part of the order of the world. One of the barbarian invaders, Odoacer (Odovakar), might seem, in 476, to have swept away the Empire from the West, when he commanded the abdication of Romulus Augustulus; and the date 476 has indeed been generally emphasized as marking "the fall of the Western empire." Other invaders, again, men like the Frank Clovis or the great Ostrogoth Theodorich, might seem, in succeeding years, to have completed the work of Odoacer, and to have shattered the sorry scheme of the later Empire, by remoulding it into national kingdoms. De facto, there is some truth in such a view: de jure, there is none. All that Odoacer did was to abolish one of the two joint rulers of the indivisible empire, and to make the one remaining ruler at Constantinople sole emperor from the Bosporus to the pillars of Hercules. He destroyed the only sovereignty which had been inaugurated by Diocletian, and returned to the unity of the Empire in the days of Marcus Aurelius. He did not abolish the Roman empire in the West: he only abolished its separate ruler, and, leaving the Empire itself subsisting, under the sway (nonnal, it is true, but none the less acknowledged) of the emperor resident at Constantinople, he claimed to act as his vicar, under the name of patrician, in the administration of the Italian provinces.

As Odoacer thus fitted himself into the scheme of empire, so did both Clovis and Theodoric. They do not claim to be emperors (that was reserved for Charlemagne); they claim to be the vicars and lieutenants of the Empire. Theodoric spoke of himself to Zeno as imperio nostro famulans; he left justice and administration in Roman hands, and maintained two annual consuls in Rome. Clovis received the title of consul from Anastasius; the Visigothic kings of Spain (like the kings of the savage Lombards) styled themselves Flavii, and permitted the cities of their eastern coast to send tribute to Constantinople. Yet it must be admitted that, as a matter of fact, this adhesion of the new barbaric kings to the Empire was little more than a form. The Empire maintained its ideal unity by treating them as its vicars; but they themselves were forming separate and independent kingdoms within its borders. The Italy of the Ostrogoths cannot have belonged, in any real sense, to the Empire; otherwise Justinian would never have needed to attempt its reconquest. And in the 7th and 8th centuries the form of adhesion itself decayed: the emperor was retiring upon the Greek world of the East, and the German conquerors, settled within their kingdoms, lost the width of outlook of their old migratory days.

It is here that the action of the Church becomes of supreme importance. The Church had not ceased to believe in the continuous life of the Empire. The Fathers had taught that when the cycle of empires was finally ended by the disappearance of the empire from Rome, the days of Antichrist would dawn; and, since Antichrist was not yet come, the Church believed that the Empire still lived, and would continue to live till his coming. Meanwhile the Eastern emperor, ever since Justinian's reconquest of Italy, had been able to maintain his hold on the centre of Italy; and Rome itself, the seat of the head of the Church, still ranked as one of the cities under his sway. The imperialist theory of the Church found its satisfaction in this connexion of its head with Constantinople; and as long as this connexion continued to satisfy the Church, there was little prospect of any change. For many years after their invasion of 688, the pressure which the Lombards maintained on central Italy, from their kingdom in the valley of the Po, kept the popes steadily faithful to the emperor of the East and his representative in Italy, the exarch of Ravenna. But it was not in the nature of things that such fidelity should continue unimpaired. The development of the East and the West could not but proceed along constantly diverging lines, until the point was reached when their connexion must snap. On the one hand, the development of the West set towards the increase of the powers of the bishop of Rome until he reached a height at which subjectation to the emperor at Constantinople became impossible. Residence in Rome, the old seat of empire, had in the 7th and 8th centuries become a contest for the imperial dignity, and to this prestige the papacy had added (pope from 590 to 604) had added in a number of ways. He was one of the Fathers of the Church, and turned its theology into the channels in which it was to flow for centuries; he had acquired for his church the great spiritual colony of England by the mission of St Augustine; he had been the protector of Italy against the Lombards. As the popes thus became more and more spiritual emperors of the West, they found themselves less and less able to remain the subjects of the lay emperor of the East. Meanwhile the emperors of the East were led to interfere in ecclesiastical affairs in a manner which the popes and the Western Church refused to tolerate. Brought into contact with the pure monotheism of Mahommedanism, Leo the Isaurian (716-741) was stimulated into a crusade against image-worship, in order to remove from the Christian Church the charge of idolatry. The West clung to its images: the popes revolted against his decrees; and the breach rapidly became irreparable. As the hold of the Eastern emperor on central Italy began to be lost, the popes may have been led to cherish the hope of becoming their successors and of founding a temporal dominion; and that hope can only have contributed to the final dissolution of their connexion with the Eastern empire.

Thus, in the course of the 8th century, the Empire, as represented by the emperors at Constantinople, began to fade utterly out of the West. It had been forgotten by lay sovereigns; it was being abandoned by the pope, who had been its chosen apostle. But it did not follow that, because the Eastern emperor ceased to be the representative of the Empire for the West, the conception of Empire itself therefore perished. The popes only abandoned the representative; they did not abandon the conception. If they had abandoned the conception, they would have abandoned the idea that there was an order of the world; they would have committed themselves to a belief in the coming of Antichrist. The conception of the world as a single Empire—Church remained: what had to be discovered was a new representative of one of the two sides of that conception. For a brief time, it would seem, the pope himself cherished the idea of becoming, in his own person, the successor of the ancient Caesars in their own old capital. By the aid of the Frankish kings, he had been able to stop the Lombards from acquiring the succession to the ducal territories of the Eastern emperor in Italy (from which their last exarch had fled overseas in 752), and he had become the temporal sovereign of those territories. Successor to the Eastern emperor in central Italy, why should he not also become his successor as representative of the Empire—all the more, since he was the head of the Church, which was coextensive with the Empire? Some such hope seems to inspire the Donation of Constantine, a document forged between 754 and 774, in which Constantine is represented as having conferred on Silvester I. the imperial palace and insignia, and therewith omnes Italiae seu occidentalium regionum provincias loca et civitates. But the hope, if it ever was cherished,
proved to be futile. The popes had not the material force at their command which would have made them adequate to the position. The great army of the Frankish kings had alone delivered them from the Lombards; the same strong arm, they found, was needed to deliver them from the wild nobility of their own city. So they turned to the power which was strong enough to undertake the task which they could not themselves attempt, and they invited the Frankish king to become the representative of the imperial conception they cherished.\(^1\) In the year 800 central Italy ceased to date its documents by the regnal years of the Eastern emperors; for Charlemagne was crowned emperor in their stead.

The king of the Franks was well fitted for the position which he was chosen to fill. He was king of a stock which had been from the first Athanasian, and had never been tainted, like most of the Germanic tribes, by the adoption of Arian tenets. His grandfather, Charles Martel, had saved Europe from the danger of a Mahommedan conquest by his victory at Poitiers (732); his father, Pippin the Short, had helped the English Boniface to achieve the conversion of Germany. The Franks themselves had turned to the Frankish kings for support again and again in the course of the 8th century. Gregory III., involved in bitter hostilities with the iconoclastic reformers of the East, appealed to Charles Martel for aid, and even offered the king, it is said, the titles of consul and patrician. Zacharias pronounced the deposition of the last of the Merovingsians, and gave to Pippin the title of king (751); while his successor, Stephen II., hard pressed by the Lombards, who were eager to replace the Eastern emperors in the possession of central Italy, not only asked and received the aid of the new king, but also acquired, in virtue of Pippin's donation (754), the disputed exarchate itself. Thus was laid the foundation of the States of the Church; and the grateful pope rewarded the donation by the gift of the title of *patricius Romanorum*, which conferred on its recipient the duty and the privilege of protecting the Roman Church, along with some undefined measure of authority in Rome itself.\(^2\) Finally, in 773, Pope Adrian I. had appealed to Charles, the successor of Pippin, against the aggressions of the last of the Lombard kings; and in 774 Charles conquered the Lombard kingdom, and himself assumed its iron crown. Thus by the end of the 8th century the Frankish king stood on the very steps of the imperial throne. He ruled a realm which extended from the Pyrenees to the Harz, and from Hamburg to Rome—a realm which might be regarded as in itself a *de facto* empire. He bore the title of *patricius*, and he had shown that he did not bear it in vain by his vigorous defence of the papacy in 774. Here there stood, ready to hand, a natural representative of the conception of Empire; and Leo III., finding that he needed the aid of Charlemagne to maintain himself against his own Romans, finally took the decisive step of crowning him emperor, as he knelt in prayer at St Peter's, on Christmas Day, 800.

The coronation of Charlemagne in 800 marks the coalescence into a single unity of two facts, or rather, more strictly speaking, of a whole theory. The fact is German and secular: it is the wide *de facto* empire, which the Frankish sword had conquered, and Frankish policy had organized as a single whole. The theory is Latin and ecclesiastical: it is a theory of the necessary political unity of the world, and its necessary representation in the person of an emperor—a theory half springing from the unity of the old Roman empire, and half derived from the unity of the Christian Church as conceived in the New Testament. If we seek for the force which caused this fact and this theory to coalesce in the Carolingian empire, we can only answer—the papacy. The idea of Empire was in the Church; and the head of the Church translated this idea into fact. If, however, we seek to conceive the event of 800 from a political or legal point of view, and to determine the residence of the right of constituting an emperor, we at once drift into the fogs of centuries of controversy. Three answers are possible from three points of view; and all have their truth, according to the point of view. From the ecclesiastical point of view, the right resides with the pope. This theory was not promulgated (indeed no theory was promulgated) until the struggles of Popacy and Empire in the course of the middle ages; but by the time of Innocent III. it is becoming an established doctrine that a *translatio imperii* took place in 800, whereby the pope transferred the Roman empire from the Germans to the person of the magnificient Charles.\(^3\) One can only say that, as a matter of fact, the popes ceased to recognize the Eastern emperors, and recognized Charles instead, in the year 800; that, again, this recognition alone made Charles emperor, as nothing else could have done; but that no question arose, at the time, of any right of the pope to give the Empire to Charlemagne, for the simple reason that neither of the actors was acting or thinking in a legal spirit. If we now turn to study the point of view of the civil lawyer, animated by such a spirit, and basing himself on the code of Justinian, we shall find that an emperor must derive his institution and power from a *lex regia* passed by the *populus Romanus*; and such a view, strictly interpreted, will lead us to the conclusion that the citizens of Rome had given the crown to Charlemagne in 800, and continued to bestow it on successive emperors afterwards. There is indeed some speech, in the contemporary accounts of Charlemagne's coronation, of the presence of "ancients among the Romans," and of "the faithful people," but they are merely present to witness or applaud, and the conception of the Roman people as the source of Empire is one that was only championed, at a far later date, by antiquarian idealists like Arnold of Brescia and Cola di Rienzi. The *faex Romuli*, a population of lodging-house keepers, living upon pilgrims to the papal court, could hardly be conceived, except by an ardent imagination, as heir to the *quirites* of the past. Finally, from the point of view of the German tribesman, we must admit that the Empire was something which, once received by his king (no matter how), descended in the royal family as an heirloom; or to which (when the kingship became elective) a title was conferred, along with the kingship, by the vote of electors.\(^4\)

But apart from these questions of origin, two difficulties have still to be faced with regard to the nature and position of the Carolingian empire. Did Charlemagne and his successors enter into a new relation with their subjects, in virtue of their coronation? And what was the nature of the relation between the pope and the emperor now established in the West? These questions require consideration when we attempt to define the nature of the empire still reigning in the East? It is true that Charlemagne exacted a new oath of allegiance from his subjects after his coronation, and again that he had a revision of all the laws of his dominions made in 802. But the revision did not amount to much in bulk: what there was contained little that was Roman; and, on the whole, it hardly seems probable that Charlemagne entered into any new relation with his subjects. The relation of his empire to the empire in the East is a more difficult and important problem. In 797 the emperor Irene had deposed and blinded her son, Constantine VI., and usurped his throne. Now it would seem that Charlemagne, whose thoughts\(^5\) were turned to the *Venerabilium* ([Corp. Jur. Canon. Decr. Greg. i. 6, c. 34).\(^6\)

\(^1\) According to the view here followed, the Church was the ark in which the conception of Empire was saved during the dark ages between 418 and 586; it was not, as some have supposed, assigned to Roman law, which continued to be administered during these centuries, especially in the towns, and maintained the imperial tradition. But the influence of the Church is the essential fact.

\(^2\) In the 4th century *patricius* came to attach particularly to those of the Roman army (magnus senator militum) to men like Aetius and Ricimer, who made and unmade emperors (cf. Mommsen, Gesammelte Schriften, iv. 537, 545 seq.). Later it had been borne by the Greek exarchs of Ravenna. The concession to Pippin of this great title makes him military head of the Western empire, in the sense in which the title was used in the 5th century; it makes him representative of the Empire for Italy, in the sense in which it had been used of the exarchs.

\(^3\) See the famous bull *Venerabilibus* (Corp. Jur. Canon. Decr. Greg. i. 6, c. 34).

\(^4\) Even on this view, an imperial coronation at the hands of the pope was necessary to complete the title; but this was regarded by the Germans (though not by the pope) as a form which necessarily followed.
were already set on Empire, hoped to depose and succeed Irene, and thus to become sole representative of the conception of Empire, both for the East and for the West. Suddenly there came, in 800, his own coronation as emperor, an act apparently unpredmeditated at the moment, taking him by surprise, as one gathers from Einhard's *Vita Karoli*, and interrupting his plans. It left him representative of the Empire for the West only, confronting another representative in the East. Such a position he did not desire: there had been a single Empire vested in a single person since 476, and he desired that there should still continue to be a single Empire, vested only in his own person. He now sought to achieve this unity by a proposal of marriage to Irene. The proposal failed, and he had to content himself with a recognition of his imperial title by the two successors of the Western Empire. This did not, however, mean (as still rate in the issue) that henceforth there were to be two conjoint rulers, amicably ruling as colleagues a single Empire, in the manner of Arcadius and Honorius. The dual government of a single Empire established by Diocletian had finally vanished in 476; and the unity of the Empire was now conceived, as it had been conceived before the days of Diocletian, to demand a single representative. Henceforth there were two rulers, one at Aix-la-Chapelle and one at Constantinople, each claiming, whatever temporary concessions he might make, to be the sole ruler and representative of the Roman empire. On the one hand, the Western emperors held that, upon the deposition of Constantine VI., Charlemagne had succeeded him, after a slight interval, in the government of the whole Empire, both in the East and in the West; on the other hand, the Eastern emperors, in spite of their grudging recognition of Charlemagne at the moment, regarded themselves as the only lawful successors of Constantine VI., and viewed the Carolings and their later successors as upstarts and usurpers, with no right to their imperial pretensions. Henceforth two halves confronted one another, each claiming to be the whole; two finite bodies touched, and each yet claimed to be infinite.

If, as has been suggested, Charlemagne did not enter into any fundamentally new relations with his subjects after his coronation, it follows that the results of his coronation, in the sphere of policy and administration, cannot have been considerable. The Empire added a new sanction to a policy and administration already developed. Charlemagne was anxious not only to suppress heresy and supervise the clergy within his borders, but also to extend true Christianity without them even before the year when his imperial coronation gave him a new title to supreme governorship in all cases ecclesiastical. He had already organized his empire on a new uniform system of counties, and the *missi dominici* were already at work to superintend the action of the counts, even before the *renovatio imperii Romani* came to suggest such uniformity and centralization. Charlemagne had a new title; but his subjects still obeyed the king of the Franks, and lived by Frankish law, in the old fashion. In their eyes, and in the eyes of Charlemagne's own descendants, the Empire was something appendant to the kingship of the Franks, which made that kingship unique among others, but did not radically alter its character. True, the kingship might be divided among brothers by the old Germanic custom of partition, while the Empire must inhere in one person; but that was the one difference, and the one difficulty, which might easily be solved by attaching the name of emperor to the eldest brother. Such was the conception of the Carolings: such was not, however, the conception of the Church. To the popes the Empire was a solemn office, to which the kings of the Franks might most naturally be called, in view of their power and the traditions of their house, but which by no means remained in their hands as a personal property. By thus seeking to isolate the Empire from any indissoluble connexion with the Carolingian house, the popes were able to save it. Civil wars raged among the descendants of Charlemagne: partitions recurred: the Empire was finally dissolved, in the sense that the old realm of Charlemagne fell asunder, in 888. But the Empire, as an office, did not perish. During the 9th century the popes had insisted, as each emperor died, that the new emperor needed coronation at their hands; and they had thus kept alive the conception of the Empire as an office to which they invited, if they did not appoint, each successive emperor. The quarrels of the Carolingian house helped them to make good their claim. John VIII. was able to select Charles the Bald in preference to other claimants in 875; and before the end of his pontificate he could write that "he who is to be ordained by us to the Empire must be by us first and foremost invited and elected." Thus was the unity of the Empire preserved, and the conception of a united Empire continued, in spite of the eventual dissolution of the realm of Charlemagne. When the Carolingian emperors disappeared, Benedict IV. could crown Louis of Provence (901) and John X. could invite to the vacant throne an Italian potentate like Berengar of Friuli (912); and even when Berengar died in 924, and the Empire was vacant of an emperor, they could hold, and hold with truth, that the Empire was not dead, but only suspended, until such time as they should invite a new ruler to assume the office. Various causes had contributed to the dissolution of the realm of Charlemagne. Partitions had split it; feudalism had begun to honeycomb it; incessant wars had destroyed its core, the fighting Franks of Austrasia. But, above all, the rise of divisions within the realm, which, whether animated by the spirit of nationality or no, were ultimately destined to develop into nations, had silently undermined the structure of Pippin and Charlemagne. Already in 842 the oath of Strassburg shows us one Caroling king swearing in French and another in German: already in 870 the partition of Monsen shows us the kings of France and Germany dividing the middle kingdom which lay between the two countries by the linguistic frontier of the Meuse and Moselle. The year 888 is the birth-year of modern Europe. France, Germany, Italy, stood distinct as three separate units, with Burgundy and Lorraine as debatable lands, as they were destined to remain for centuries to come. If the conception of Empire was still to survive, the pope must ultimately invite the ruler of the strongest of these three units to assume the imperial crown; and this was what happened when in 962 Pope John XII. invited Otto I. of Germany to the imperial throne. Otto I. instead of making a new emperor in the Western branch of the royal house, established himself in the imperial crown, and the German king. Otto I. and his son Otto II. united the two crowns, the imperial crown and the title of Roman emperor.
onwards, began to claim for themselves a feudal overlordship of the world, and to regard the emperor as the chief of their vassals. The theory of the Translation buttressed their claim to be overlords of the Empire; and the emperors found that their very duty to defend the Papacy turned them into its vassals—for was not the advocatus who defended the lands of an abbey or church its tenant by feu? service, and might not analogy extend the feudal relation to the imperial advocate himself?

The relation of the Empire to the Papacy is indeed the cardinal fact in its history for the three centuries which followed the coronation of Otto I. (962–1250). For a century (962–1076) the relation was one of amity. The pope and the emperor stood as co-ordinate sovereigns, ruling together the commonwealth of Europe. 1 It either stood before the other, the emperor stood before the pope.

The Romans had sworn to Otto I. that they would never elect or ordain a pope without his consent; and the rights over papal elections conceived to belong to the office of palatini, which they generally held, enabled the emperors, upon occasion, to nominate the pope of their choice. The partnership of Otto III., son of a Byzantine princess, and his nominee Silvester II. (already distinguished as Gerbert, scholasticus of the chapter school of Reims) forms a remarkable page in the annals of Empire and Papacy. Otto, once the pupil of Silvester in classical studies, and taught by his mother the traditions of the Byzantine empire, dreamed of renewing the Empire of Constantine, with Rome itself for its centre; and this antiquarian idealism (which Arnold of Brescia and Cola di Rienzi were afterwards, though with some difference of aim, to share) was encouraged in his pupil by the pope. Tradition afterwards ascribed to the two the first project of a crusade, and the institution of the seven electors: in truth their faces were turned to the past rather than to the future, and they sought not to create, but to renovate. The empire of Otto III. stretched the age of Constantine passed with the premature death of Otto and after the death of Silvester II. the papacy was degraded into an appendage of the Tuscan family. From that degradation the Church was rescued by Henry III. (the second emperor of the new Salian house, which reigned from 1024 to 1125), when in 1046 he caused the deposition of three competing popes, and afterwards filled the papal chair with his own nominees; but it was restored more effectually by itself, when in 1059 the celebrated bull In nomine Domini of Nicholas II. reserved the right of electing the popes to the college of cardinals (see Conclave). A new era of the Papacy begins with the decree, and that era found its exponent in Hildebrand. If under Henry III. the Empire stands in many respects at its zenith, and the emperor nominates to the Papacy, it sinks, under Henry IV., almost to the nadir of its fortunes, and a pope attempts, with no little success, to fight and defeat an "effective" empire, if indeed it may be called effective, embraced only Germany, Burgundy and the regnum Italice (the old Lombard kingdom in the valley of the Po).

1 It is a curious fact that imperial titles (imperator and basilius) are used in the diplomatic vocabulary of the 10th century. Edilch, for instance (946–955) is "imperator," "cyning and casere toctus Britanniae," "basileus Anglorum hujusque insulae barbarorum": Edgar is "toctus Albionum imperator Augustus" (cf. Stubbs, Const. Hist., i. vol. iv.), with the title "princeps" added to it. In Latin, in the 10th century, partly indicate the quasi-imperial position held by the Wessex kings after the reconquest of the Danes. But there seems to be no real ground for Freeman's view (Norman and Anglo-Saxon, p. 254) that the English was regarded as a third Empire, side by side with the other Empires of West and East Europe. That the titles were assumed in order to repudiate possible claims of the Western Empire to the overlordship of England is dispelled by the fact that they were used at a time when there was no Western emperor. The assumption of an imperial style by Henry VIII., which is mentioned below, is explained by the Reformation, and does not mean any recurrence to a forgotten Anglo-Saxon claim. 2

2 It is in virtue of this aspect that the Empire is holy. The term sacrum imperium seems to have been first used about the time of Frederick I., when the emperors were anxious to magnify the sanctity of their office in answer to papal opposition. The word itself (see under Emperor) was always regarded, and at his coronation treated, as a persona ecclesiastica.
great loss of prestige. The emperor lost his hold over Germany, where the aid of the pope strengthened the hands of the discontented nobility: he lost his hold over Italy, where the Lombard towns gradually acquired municipal independence, and the donation of the Countess Matilda gave the popes the germ of a new and stronger dominium temporale. The First Crusade came, and the emperor, its natural leader, could not lead it; while the centre of learning and civilization, in the course of the fifty years' War of Investitures, gradually shifted to France. The struggle was finally ended by a compromise—the Concordat of Worms—in 1122; but the Papacy, which had fought the long War of Investitures and inspired the First Crusade, was a far greater power than it had been at the beginning of the struggle, and the emperor, shaken in his hold on Germany and Italy, had lost his prestige. The papacy came to regard the emperor as little more than a vassal, and began to hold to the theory that the feudal subjection of the emperor to the pope, foreshadowed in the pontificate of Innocent II., and definitely enounced by the envoys of Adrian IV. at the diet of Besançon in 1155, now begins to arise. The popes, who had called the emperors to be heads of the European commonwealth in 800 and again in 962, begin to vindicate that headship for themselves. Gregory VII. had already claimed that the pope stood to the emperor, as the sun to the moon; and gradually the old coordination disappeared in a new subordination of the Empire to the papal plenitudo potestatis. The claim of ecclesiastical independence of the middle of the 11th century was rapidly becoming a claim of ecclesiastical supremacy in the middle of the 12th: the imperial claim to nominate popes, which had taken its present form under the pontificate of Urban II., was a fantasy of the Lombard emperors. Yet at this very time a new period of splendid dawning for the Empire; and the rule of the three Hohenstaufen emperors, Frederick I., Henry VI. and Frederick II. (1152-1250), marks the period of its history which attracts most sympathy and admiration.

Frederick I. regained a new strength in Germany, partly because he united in his veins the blood of the two great contending families, the Welfs and the Welfingens; partly because he had acquired large patrimonial possessions in Swabia, which took the place of the last Saxon desmesne; partly because he had a greater control over the German episcopate than his predecessors had enjoyed for many years past. At the same time the revival of interest in the crusading movement gave new life and vigour to the old idea of the emperor as the head of Christendom. The papal form in the middle of the 12th century was to substitute for the feudal despotism of the High Middle Ages, an imperial despotism for the restoration and propagation of Christianity, as the state in which he reigned was the central government of a world in which the pope had a share. But the idea of the crusade soon passed from its religious to its State and political aspect. The Four and Five Years' Peace of the Holy Roman Empire, from 1218 to 1222, brought back the hope of the crusade and the idea of the emperor as the leader of the Christian community. The idea of the crusade and the idea of the empire were blended, and the empire took on a religious character, a Catholic character, as the papacy took on a secular character, a German character.

The Hohenstaufen emperors.

The Empire from the Conquest of Rome to the Abdication of Rudolph of Habsburg, 1273.

When Frederick II. died (1250), he summoned Charles of Anjou to Sicily to exterminate his house. By 1268 he had done his work, and the medieval Empire was practically at an end. When Rudolph of Habsburg succeeded in 1273, he was only the head of a federation of princes in Germany, while in Italy he abandoned all claims over the centre and south, and only retained titular rights in the Lombard plain.

Thus ended the first great chapter in the history of the Holy Roman Empire which Otto had founded in 962. In those three centuries the great fact had been its relation to the Papacy: in the last two of those three centuries the relation had been one of enmity. The basis of the enmity had been the papal claim to supreme headship of Latin Christianity, and to an independent temporal desmesne in Italy as the condition of that headship. Because they desired supreme headship, the popes had sought to crush the power of the empire, and if the emperors could not be made dependent upon, their—perhaps a mere fief held at St Peter: because they desired a temporal desmesne, they had sought to expel him from Italy, since any imperial hold on Italy threatened their independence. They had succeeded in defeating the Empire, but they had also destroyed the Papacy; for the French aid which they had invoked against the Hohenstaufen developed, within fifty years of the fall of that house, into French control, and the captivity at Avignon (1308-1378) was the logical result of the final victory of Charles of Anjou at Tagliacozzo. The struggle seemed to have ended in nothing but the exhaustion of both combatants. Yet in many respects it had in reality made for progress. It had set men thinking of the respective limits of church and state, and of the relation of the one to the other, and the relations of the respective systems of law as the formative powers of the modern state.

The great period of the papacy in Italy, the period of Avignon, had seen the emergence of a new order of things in the public and private life of the state. The political system of the Empire had been a series of princely states, the independent states of the empire; the political system of Italy had been a series of princely states, the independent states of the papacy. The imperial despotism had been a despotism of princes over princes; the papal despotism in Italy was a despotism of princes over the people. The one had been a despotism of the individual, the other had been a despotism of the community. The one had been a despotism of the feudal period, the other a despotism of the modern period. The one had been a despotism of the old empire, the other a despotism of the new state.

EMPIRE

Wittelsbach emperors belong to the history of Germany. Yet two of these emperors, Henry VII. and Louis IV., should not pass without notice, the one for his own sake, the other for the sake of his adherents, and both because, by interfering in Italy, and coming into conflict with the Papacy, they brought once more into prominence the European aspect of the Empire.

Henry VII., the contemporary and the hero of Dante, descended into Italy in 1310, partly because he had no power and no occupation in Germany, partly because he was deeply imbued with the sense of his imperial dignity. Coming as a peacemaker and mediator, he was driven by Guelph opposition into a Ghibelline rôle; and he came into conflict with Clement V., the first of the Avignonese popes, who, under the pressure of France attempted to enforce upon Henry a recognition of his feudal subjection. Henry asserted his independence; he claimed Rome for his capital, and the lordship of the world for his right; but, just as a struggle seemed impending, he died, in 1313. During the reign of his successor, Louis IV., the struggle came. Louis had been excommunicated by John XXII. in 1324 for acting as emperor before he had received papal recognition. In 1328, he came to Rome for his coronation. He had gathered round him three troops; on the one hand, the more advanced Franciscans, apostles of the cause of clerical disendowment, and imitators to a wealthy papacy; on the other hand, jurists like Marsilius of Padua and John of Jandun, who brought to the cause of Louis the spirit and the doctrines which had already been used in the struggle between Boniface VIII. and Philip IV. of France. Marsilius in particular, in a treatise called the Defensor Pacis, insisted on the majesty of the lay state, and even on its superiority to the Church. Perhaps it was Marsilius, learned as he was in Roman law, and remembering the lex regia by which the Roman people had of old conferred its power on the emperor, who suggested to Louis the policy, which he followed, of receiving the imperial crown by the decree and at the hands of the Roman people. The policy was remarkable: Louis embraced an alliance which Frederick Barbarossa had spurned, and recognized the medieval Romans as the source of imperial power. Not less remarkable was the new attitude of the German electors, who for the first time supported an emperor against the pope, because they now felt menaced in their own electoral rights; and the one permanent result which finally flowed from the struggle was the enunciation and definition of the rights and privileges of the electors in the Golden Bull of 1356 (see Golden Bull).

In this struggle with the Papacy the Empire had shown something of its old universal aspect. It had come into connexion with Italy, and into close connexion with Rome: it had enlisted in defence of its rights at once an Italian like Marsilius and an Englishman like Ockham. The same universal aspect appeared once more in the age of the conciliar movement, at the beginning of the 15th century. One of the essential duties of the emperor, as defender of the Church, was to help the assembling and the deliberations of general councils of the Church. This was the duty discharged by Sigismund, when he forced John XXIII. to summon a council at Constance in 1414, and sought, though in vain, to guide its deliberations. The journey which Sigismund undertook in the interests of the council (1415-1417) is particularly noteworthy. He sought to make peace throughout western Europe, acting as international arbitrator—in virtue of the presidency of western Europe—between England and France, between Burgundians and Armagnacs; but he failed in his aim, and when he returned to the council, it was only to witness the defeat of the party of reform which he championed. National feeling and national antipathies proved too strong for Sigismund's attempt to revive the medieval empire for the purposes of international arbitration: the same feeling, the same antipathies, made inevitable the failure of the council itself, in which western Europe had sought to meet once more as a single religious commonwealth. Early in the 15th century, therefore, the conception of the unity of western Europe, as a single Empire-Church, was already waning in both its aspects. The unity of the Church Universal was dissolving, and the conception of the nation-church arising (as the separate concordats granted by Martin V. to the different nations proved); while the unity of the Empire was proved a dream, by the powerlessness of the emperor in the face of the struggle of England and France.

Renaissance and Reformation combined to complete the fall which the failure of Sigismund to guide the conciliar movement had already foreshadowed. The Renaissance, revolting against the medievalism of the studium and not sparing even the sacerdotium of the middle ages, had little respect for the medieval imperium; and, going back to pure Latin and original Greek, it went back beyond even the classical empire to find its ideals and inspirations. But it is the coming of the Reformation, and with it of the nation-church, which finally marks the epoch at which the last vestige of the old conception of the political unity of the world disappears before the nation-state. Externally indeed it seemed, at the time of the Reformation, as if the old Empire had been revived in the person of Charles V., who owned territories as vast as those of Charlemagne. But Charles's dominions were a dynastic empire only, having no real political conception; and, though Charles was a champion of the one Catholic conception against the Reformers, he did not in any way seek to revive the power of the medieval empire. Meanwhile the reforming monarchs, while they cast off the Roman Church, cast off with it the Roman empire. Henry VIII. declared himself free, not only of the pope, but of all other foreign power; not only so, but as he sought to take the place of the pope with regard to his own church, so he sought to take the place of the emperor with regard to his kingdom, and spoke of his "imperial" crown, a style which recurs in later Tudor reigns. The conception of one Empire passed out of Europe, or, if it remained, it remained only in an honorary precedence accorded by other sovereigns to the king of Germany, who still entitled himself emperor. In Germany itself the honorary presidency which the emperor enjoyed over the princes came to mean still less than before, when religious differences divided the country, and the principle of ejus regio ejus religio accentuated the local autonomy of the prince. When Charles abdicated in 1556, the change which the accession of Rudolph of Habsburg had already marked was complete: there was no empire except in Germany, and in Germany the Empire was nothing more than a convenient legal conception. The Reformation, by sweeping away the spiritual unity of western Christendom, had swept away any real conception of its political unity, and with that conception it had swept away the Empire; while it had also, by splitting Germany into two religious camps, and making the emperor at the most the head of a religious faction, dissipated the last vestiges of a real Empire in the country which had, since 662, been its peculiar home.

From 1556 to 1606 the Empire means a loose federation of the different princes of Germany, lay and ecclesiastical, under the presidency, elective in theory but hereditary in practice, of the house of Habsburg. It is an empire very much in the same sense as the modern German empire, with a diet somewhat analogous to the modern Bundesrat, and a cumulative imperial chamber for purposes of justice, hardly at all analogous to the present organized system of federal justice which prevails in Germany to-day. The dissolution of the Holy Roman Empire into this loose federation had already been anticipated by the concessions made to the princes by Frederick II. in 1220 and 1231; but the final organization of Germany on federal lines was only attained in the treaty of Westphalia of 1648. The attempt of Ferdinand II., in the course of the Thirty Years' War, to assert a practically monarchical authority over the princes of Germany, only led to the regular vindication by the princes of their own monarchical authority. The emperor, who had tried in the 15th century to be the international authority of all Europe, now sank to the position of a less than inter-state arbitrator in Germany. That the Empire and the emperor were retained at all, when the princes became

1 Cf. the Act 25 Henry VIII. c. 22, § 1: "the lawful kings and emperors of this realm."
so many independent sovereigns, was due partly to a lingering sense of quasi-national sentiment for a magni nominis umbra, partly to the need of some authority which should combine in one whole principalities of very different sizes and strengths, and should protect the weak from the strong, and all from France. But this authority only found its symbol in the emperor. Such real federal authority as there was remained with the diet, a congress of sovereign princes through their accredited representatives; and the emperor's sole rights, as emperor, were those of granting titles and confirming tolls. The Habsburgs, emperors in each successive generation, never pursued an imperial, but always a dynastic policy; and they were perfectly ready to sacrifice to the agrandizement of their house the honour of the Empire, as they ceded Lorraine to France in return for Tuscany (1735).

It needed the cataclysm of the French Revolution finally to overthrow the Empire. Throughout the 18th century it lasted, a thing of long-winded protocols and never-ending lawsuits, "neither Holy, nor Roman, nor an Empire." But with Napoleon came its destroyer. As far back as the end of the 13th century, French kings had been scheming to annex the title or at any rate absorb the territories of the Empire: at the beginning of the 19th century the annexation of the title by Napoleon seemed very imminent. Posing as the New Charlemagne ("because, like Charlemagne, I unite the crown of France to that of the Lombards, and my Empire marches with the East"), he resolved in 1806, during the dissolution and recomposition of Germany which followed the peace of Lunéville, to out Francis II. from his title, and to make the Holy Roman Empire part and parcel of the "Napoleonic idea." He was anticipated, however, by the prompt action of the proud Habsburg, who was equally resolved that no other should wear the crown which he himself was powerless to defend, and accordingly, on the 6th of August 1806, Francis resigned the imperial dignity. So perished the Empire. Out of its ashes sprang the Austrian Empire, for Francis, in 1804, partly to counter Napoleon's assumption of the title of Emperor of the French, partly to prepare for the impending dissolution of the old Empire, had assumed the title of "Hereditary Emperor of Austria." And in yet more recent times the German empire may be regarded, in still a more real sense than Austria, as the descendant and representative of the old Empire of the German nation.

What had been the results of the Holy Roman Empire, in the course of its long history, upon Germany and upon Europe? It has been a vexata quaestio among German historians, whether or no the Empire ruined Germany. Some have argued that it diverted the attention of the German kings from their own country to Italy, and that, by bringing them into conflict with the popes, and by thus strengthening the hands of their rebellious baronage with a papal alliance, it prevented the development of a national German monarchy; such as other sovereigns of western Europe were able to found. Others again have emphasized the racial divisions of Saxons and Franks, of the German and Latin names, as the great cause of the failure of Germany to grow into a united national whole, and have sought to ascribe to the influence of the Empire such unity as was achieved; while they have attributed the learning, the trade, the pre-eminence of medieval Germany to the Italian connexion and the prestige which the Empire brought. It is difficult to pronounce on either side; but one feels that the old localism and individualism which characterized the early German, and had never, on German soil, been combined with and counteracted by a large measure of Roman population and Roman civilization, as they were in Gaul and Spain, would in any case have continued to divide and disturb Germany till late in her history, even if the Empire had never come to reside within her borders. Of the larger question of the influence of the Empire on Europe we can here only say that it worked for good. An Empire which represented, as a Holy Empire, the unity of all the faithful as one body in their secular, no less than in their religious life—an Empire which, again, as a Roman Empire, represented with an unbroken continuity the order of Roman administration and law—such an empire could not but make for the betterment of the world. It was not an empire resting on force, a military empire; it was not, as in modern times empires have sometimes been, an autocracy warranted and stamped by the plébiscite of the mob. It was an empire resting neither on the sword nor on the ballot-box, but on two great ideas, taught by the clergy and received by the laity, that all believers in Christ form one body politic, and that the one model and type for the organization of that body is to be found in the past of Rome. It was indeed the weakness of the Empire that its roots were only the thoughts of men; for the lack of material force, from which it always suffered, hindered it from doing work it might well have done—the work, for instance, of international arbitration. Yet, on the other hand, it was the strength and glory of the Empire that it lived, all through the middle ages, an unconquerable idea of the mind of man. Because it was a being of their thought, it stirred men to reflection: the Empire, particularly in its clash with the Papacy, produced a political consciousness and a political speculation reflected for us in the many libelli de l'fe imperatorum et pontificum, and in the exigencies of Dantzig and Padua. Roman, it perpetuated the greatest monument of Roman thought—that ordered scheme of law, which either became, as in England, the model for the building of a native system, or, as in Germany from the end of the 15th century onwards, was received in its integrity and administered in the courts. Holy, it fortified and consolidated Christian thought, by giving a visible expression to the kingdom of God upon earth; and not only so, but it maintained, however imperfectly, some idea of international obligation, and some conception of a commonwealth of Europe.1

The Holy Roman Empire of western Europe had in its own day a contemporary and a rival—that east Roman empire of which we have already spoken. From Arcadius to John Paleologus, from A.D. 395 to 1453, the roman empire was continued at Constantinople—not as a theory and an idea, but as a simple and daily reality of politics and administration. In one sense the Eastern Roman Empire was more linearly and really Roman than the West: it was absolutely continuous from ancient times. In another sense the Western Empire was the most Roman; for its capital—in theory at least—was Rome itself, and the Roman Church stood by its side, while Constantinople was Hellenic and even oriental. Between the two Empires there was fixed an impassable gulf; and they were divided by deep differences of thought and temper, which appeared most particularly in the sphere of religion, and expressed themselves in the cleavage between the Catholic and the Orthodox Churches. Yet, as when Rome fell, the Catholic Church survived, and ultimately found for itself a new Empire of the West, so, when Constantinople fell, the Orthodox Church continued its life, and found for itself a new Empire of the East—the Empire of Russia. Under Ivan the Great (1462-1505) Moscow became the metropolis of Orthodoxy; Byzantine law influenced his code; and he took as his cognisance the double-headed eagle. Ivan the Terrible, his successor, finally succumbed, and henceforth the Russian emperor is, in theory and very largely in fact, the successor of the old East Roman emperor,2 the head of the Orthodox Church, with the mission of vengeance on Islam for the fall of Constantinople.

In the 19th century the word "empire" had a large and important bearing in politics. In France it has been the apagane of the Bonapartes, and has meant a centralized system of government by an efficient Caesar, resting immediately on the people, and annihilating the powers of the people's representatives. Under Napoleon I. this conception had a Carolingian colour: under Napoleon III. there is less of

---

1 The Papacy, consistent to the last, formally protested at the Congress of Vienna in 1815 against the failure of the Powers to restore the Holy Roman Empire, the "centre of political unity" (Ed.).

2 The Turks, occupying Constantinople, have also claimed to be the heirs of the old emperors of Constantinople; and their sultans have styled themselves keiser-i-Rüm.
EMPIRICISM—EMPLOYERS’ LIABILITY

Carolingianism, and more of Caesarism—more of a popular dictatorship. While in modern France Empie has meant autocracy instead of representative government, in Germany it has meant a greater national unity and a federal government in the place of a confederation. The modern German empire is at once like and unlike the old Holy Roman Empire. It is unlike the old medieval Empire; for it has no connexion with the Catholic Church, and no relation to Rome. But it is like the Holy Roman Empire of the 17th and 18th centuries—for it represents a federation, but a more real and more unitary federation, of the several states of Germany. The likeness is perhaps more striking than the dissimilarity; and in virtue of this likeness, and because the memory of the old German Kaiserzeit was a driving force in 1870, we may speak of the modern German empire as the successor of the old Holy Roman Empire, if we remember that we are speaking of that Empire in its last two centuries of existence. The modern “Empire of Austria,” on the other hand, does not connote an empire in the sense of a federation, but is a convenient designation for the sum of the territories ruled by a single sovereign under various titles (king of Bohemia, archduke of Austria, &c.) and unified in a single political system. The title of Emperor was assumed, as we have seen, through an historical accident; and, though the Habsburgs of to-day are personally the lineal descendants of the old Holy Roman emperors, they do not in any way possess an empire that represents the old Holy Empire. In England, of recent years, the term “Empire” and the conception of imperialism have become prominent and crucial. To Englishmen to-day, as to Germans before 1870, the term and the conception stand for the greater unity and definitely federal government of a number of separate states. For the German, indeed, Empire has meant, in great measure, the strengthening of a loose federal institution by the addition of a common personal superior: to us it means the turning of a loose union of separate states already under a common personal superior—the King—into a federal commonwealth living under some common federal institutions. But the aim is much the same; it is the integration of a people under a single scheme which shall be consistent with a large measure of political autonomy. We speak of imperial federation; and indeed our modern imperialism is closely allied to federalism. Yet we do well to cling to the term empire rather than federation; for the one term emphasizes the whole and its unity, the other the part and its independence. This imperialism, which is federalism viewed as making for a single whole, is very different from that Bonapartist imperialism, which means autocracy; for its essence is free co-ordination, and the self-government of each co-ordinated part. The British Empire (q.v.) is, in a sense, an aspiration rather than a reality, a thought rather than a fact; but, just for that reason, it is like the old Empire of which we have spoken; and though it be neither Roman nor Holy, yet it has, like its prototype, one law, if not the law of Rome—one fact, if not in matters of religion, at any rate in the field of political and social ideals.

Authorities.—See, in the first place, J. Bryce, Holy Roman Empire (1904 edition); J. von Döllinger, article on “The Empire of Charles V” (in Essays on Historical and Literary Subjects, translated by Margaret Warre, 1894); H. Fisher, The Medieval Empire (1889); E. Gibbon, The Decline and Fall of the Roman Empire, edited by J. B. Buru. It would be impossible to refer to all the books bearing on the subject, but one may select (i.) for the period of the Empire: J. J. G. Band, “Empire and Principes” in Smith’s Dictionary of Greek and Roman Antiquities (1890); (ii.) for the period from 476 down to 888, T. Hodgkin, Italy and her Invaders (1850-1900); (iii.) for the period from 1806 to 1815, F. Gregorowitsch, Geschichte der Staat und der Deutsche (1866-1890); (iv.) for the period from 1815 to 1866, E. Lavisse, Histoire de France, t. i. (1901); J. B. Buru, History of the Later Roman Empire (1889); (viii.) for the Holy Roman Empire of the German nation, W. von Giesebricht, Geschichte der deutschen Kaiserzeit (1881-1890); J. Zeller, Historie d’Allemagne (1872-1891); R. L. Poole, Illustrations of Medieval Thought (1884); S. Riezler, “The Post Ancien régime (from 1789) to the present.”

Seeley, Life and Times of Stein (1878); H. von Treitsche, Deutsche Geschichte (1859-1894); and H. von Sybel, Geschichte des deutschen Recht (1860-1894). On the influence of the Holy Roman Empire upon the history of Germany, see J. F. E. Steiner, Geschichte der modernen deutschen Idee (1870); F. G. Schroeder, Geschichte der modernen deutschen Idee (1874); and H. von Sybel, Die deutsche Nation und das Kaiserreich (1861). (E. Br.)

EMPIRICISM (from gr. Εμπιρευ, skilful in, from πειρα, experiment), in philosophy, the theory that all knowledge is derived from sense-given data. It is opposed to all forms of intuitionalism, and holds that the mind is originally an absolute blank (tabula rasa), on which, as it were, sense-given impressions are mechanically recorded, without any action on the part of the mind. The process by which the mind is thus stored consists of an infinity of individual impressions. The frequent or invariable recurrence of similar series of events gives birth to the mind to what are wrongly called “laws”; in fact, these “laws” are merely statements of experience gathered together by association, and have no other kind of validity. In other words, the empirical laws, in the ordinary phraseology of science, are such and law does not contain the word “must”; it merely asserts that such and such series have been invariably observed. In this theory there can strictly be no “causation”; one thing is observed to succeed another, but observations cannot assert that it is “caused” by that thing; it is post hoc, but non propter hoc. The idea of necessary connexion is a purely mental idea, an a priori conception, in which observation of empirical data takes no part; empiricism in ethics likewise does away with the idea of the absolute authority of the moral law as conceived by the intuitionalists. The moral law is merely a collection of rules of conduct based on an infinite number of special cases in which the convenience of society or its rulers has subordinated the inclination of individuals. The fundamental objection to empiricism is that it fails to give an accurate explanation of experience; individual impressions as such are momentary, and their connexion into a body of coherent knowledge presupposes mental action distinct from mere receptivity. Empiricism was characteristic of all early speculation in Greece. During the middle ages the empiric spirit was in abeyance, but it revived from the time of Francis Bacon and was systematized especially in the English philosophers, Locke, Hume, the two Mills, Bentham and the associationist school generally. See Association of Ideas; Metaphysics; Psychology; Logic; besides the biographies of the empirical philosophers.

In medicine, the term is applied to a school of physicians who, in the time of Celsus and Galen, advocated accurate observation of the phenomena of health and disease in the belief that only by the collection of a vast mass of instances would a true science of medicine be attained. This point of view was carried to extremes by those who discarded all real study, and based their treatment on rules of thumb. Hence the modern sense of empirical as applied to the gross work of an untrained quack or charlatan.

EMPLOYERS’ LIABILITY.

The law of England as to the liability of employers in respect of personal injuries to their servants is regulated partly by the common law and partly by statute; but by the Employers’ Liability Act 1880, such exceptions have been drafted upon the common law, and by the Workmen’s Compensation Act 1906, principles so alien to the common law have been applied to most employments that it is impossible now to present any view of this branch of the law as a logical whole. All that can be done is to state the nature of the liability at common law.

1 This does not, of course, apply to Hungary, which since 1867 has not formed part of the Austrian empire and is ruled by the head of the house of Habsburg not as emperor, but as king of Hungary.

2 “Employ” comes through Fr. from Lat. implicare, to entwine, Late Lat. to direct on something.

356
the extension of it effected by the Employers' Liability Act 1880, and the new liabilities introduced by later acts.

At common law the liability of a master is of a very limited character. There is, of course, nothing to prevent a master and servant from providing by special contract in any way they please for their mutual rights in cases of personal injury to the servant. In such cases the liability will depend upon the terms of the special contract. But apart from any special agreement, it may be broadly stated that a master is liable to his servants only for injuries caused by his own negligence. Injuries to a servant may arise from accident, from the nature of the service, or from negligence; and this negligence may be of the master, of another servant of the master, or of a stranger. If the injury is purely accidental the loss lies where it falls. If it arises from the nature of the service, the servant must bear it himself; he has undertaken a service to which certain risks are necessarily incident; if he is injured thereby, it is the fortune of war, and no one can be made responsible. If the injury is caused by the negligence of a stranger, the servant has his ordinary remedy against the wrong-doer, or any one who is responsible as a principal for the conduct of the wrong-doer. If it is caused by the negligence of a fellow-servant, he likewise has his ordinary remedy against the actual wrong-doer; but, by virtue of what is known as the doctrine of common employment, he cannot at common law make the master liable as a principal. The only case (independently of modern legislation: see below) in which he can recover damages from the master is where the injury has been caused by negligence of the master himself. A master is negligent if he fails to exercise that skill and care which, in the circumstances of the particular employment, are used by employers of ordinary skill and carefulness. If he himself takes part in the work, he must act with such skill and care as may reasonably be demanded of one who takes upon himself to do work of that kind. If he entrusts the work to other servants, he must be careful in their selection, and must not negligently employ persons who are incompetent. He must take proper care so to arrange the system of work that his servants are not exposed to unnecessary danger. If tools or machinery are used, he must take proper care to provide such as are fit and proper for the work, and must either himself see that they are maintained in a fit condition or employ competent servants to do so for him. If he is bound by statute to take precautions for the safety of his servants, he must himself see that that obligation is discharged. For breach of any of these duties a master is liable to his servant who is injured thereby, but his liability extends no further.

That his obligations to a servant are so much less than to a stranger is chiefly due to the doctrine of common employment.

As a rule a master is responsible for the negligence of his servant acting in the course of his employment; but, from about the middle of the 19th century, it became firmly rooted in the law that this principle did not apply where the person injured was himself a servant of the master and engaged in a common employment with the servant guilty of the negligence. In effect this rule protects a master as against his servant from the consequences of negligence on the part of any other of his servants; to this there is no qualification except that, for the rule to apply, both the injured and the negligent servant must be acting in the course of their employment. They must both be working for a common object though not necessarily upon the same work.

It is not easy to define precisely what constitutes a common employment in this sense, and there is particularly little judicial authority as to the limit at which work for the same employer ceases to be work in a common employment. It does not depend on difference in grade; all engaged in the same business, from the manufacturers on the side of the conduct of the work are without limitation; all the work is the same. It does not necessarily depend on difference of locality; a servant who packs goods at the factory and a servant who packs them in the shop may well be in a common employment. On the other hand, it is not enough that the two servants are working for the same employer, if there is nothing in common between them except that they are making money for the same man; apart from special circumstances, the crews of two ships owned by the same company are probably not in common employment. The difference is in the way in which the work is conducted, and whether the working conditions and wages are uniform, that is the yardstick by which the test is generally made.

Common law.

It is in the domestic service that the doctrine has been most developed. Where servants were employed for a limited time, such as the servants of a factory, this was considered to be a common employment and thus the master was liable. Or if they were employed in the same house for a long period, such as the servants of a member of Parliament, the master might be liable. In other circumstances of the ordinary course of things, he is not responsible. In doing his master's business, he is not responsible for his master's negligence, although it must be shown that the risk was reasonably foreseeable.

Employers' Liability Act 1880.

The act of 1880.

was passed. The effect of this act is to destroy the defence of common employment in certain specified cases. It does not abolish the doctrine altogether, nor, on the other hand, does it impose upon the master any new standard of duty which does not exist as regards strangers. All that it does is to place the servant, in certain cases, in the position of a stranger, making the master liable for the negligence of his servants notwithstanding the fact that they are in common employment with the injured person. It is still necessary under the act, as at common law, to prove negligence; the master may still rely upon the defences of contributory negligence, nuisance, and so forth.

But under the act he cannot, as against the workmen themselves, take the same course within it and in the cases to which it applies, set up the defence that the negligence complained of was the negligence of a servant in a common employment. The act does not apply to all servants. It does not apply to domestic or menial servants, or to seamen, or to any except railway servants and "any person who, being a labourer, servant in husbandry, journeyman, artificer, handicraftsman, miner, or otherwise engaged in manual labour..." has entered into or works under a contract with an employer, whether the contract be oral or in writing, and be a contract of service or a contract personally to execute any work or labour. Whether a servant, not being one of those specially named, is within the act depends on whether manual labour is the real and substantial employment, or whether it is merely...
incidental thereto; thus a carman who handles the goods he carries may be within the act, but a tramcar driver or an omnibus conductor is not. The act does not make the master liable for the negligence of all his servants, but, speaking generally, only for the negligent discharge of their duties by such as are entrusted with the supervision of machinery and plant, or with superintendence, or the power of giving orders, with the addition, in the case of a railway, of the negligence of those who are given the charge or control of signals, points, locomotive engines or trains. The cases dealt with by the act are five in number; in the first and fourth the words are wide enough to include negligence of the employer himself, for which, as has been seen, he is liable at common law. In such instances the workman has an alternative remedy either at common law or under the act, but in all other respects the rights given by the act are new, being limitations upon the defence of common employment, and can be enforced only under the act.

The first case is where the injury is caused by reason of any defect in the condition of the works, service, machinery or plant connected with or used in the business of the employer, provided that such defect arises from, or has not been discovered or remedied owing to the negligence of the employer, or of some person in the service of the employer and entrusted by him with the duty of seeing that the works, service, machinery or plant are in proper condition. In the second case is where the injury is caused by reason of the negligence of any person in the service of the employer who has any superintendence entrusted to him (that is, a person whose sole or principal duty is that of superintendence and who is not ordinarily engaged in manual labour) whilst in the execution of such superintendence. The third case is where the injury is caused by reason of the negligence of any person in the service of the employer, employees, masters or directions where the workman at the time of the injury is bound to conform and does conform, where such injury results from his so conforming. The fourth case is where the injury is caused by reason of the act or omission of any person in the service of the employer done or made in obedience to the rules or by-laws of the employer, or in obedience to particular instructions given by any person delegated with the authority of the employer in that behalf, provided that the injury results from negligence or defect in such rules, by-laws or instructions. The fifth case is where the injury results from the negligence of any person in the service of the employer who has the charge or control of any signal, points, locomotive engine or train upon a railway.

In all these cases it is provided that the employer shall not be liable if it can be shown that the workman knew of the defect or negligence which caused his injury, and failed within a reasonable time to give, or cause to be given, information thereof to the employer or some person superior to himself in the service of the employer, unless he was aware that the employer or such superior already knew of the said defect or negligence. It was inevitable that these provisions should call for judicial interpretation, and a considerable body of authority has grown up about the subject. Where general words are used, it must always occur that, between the cases which are obviously within and those which are obviously without the words, there are many on the border line. Thus, under the act, the courts have been called upon to determine the precise meaning of "way," "work," "machinery," "plant," and to say what is precisely meant by a "defect" in the condition of each of them. They have had to say what is included in "railway" and in "train," what is meant by having "charge" or "control," and to what extent one whose principal duty is superintendence may participate in manual labour without losing his character of superintendent, and what is the precise meaning of negligence in superintendence. These are only illustrations of many points of detail which, having called for judicial interpretation, will be found fully dealt with in the text-books on the subject. A workman who, being within the act, is injured by such negligence of a fellow-servant as is included in one or other of the five cases mentioned above means the right of action which the act gives him. These are not necessarily the same as those which a stranger would have in the like circumstances; the amount of compensation is not left at large for a jury to determine, but is limited to an amount not exceeding such sum as may be found to be equivalent to the estimated earnings, during the three years preceding the injury, of a person in the same grade employed during those years in the like employment and in the district in which the workman is employed at the time of the injury. Moreover, the right to recover is hedged about with technicalities which are unknown at the common law; proceedings must be taken in the county court, within a strictly limited time, and are maintainable only if certain elaborate provisions as to notice of injury have been complied with. Where the injury causes death the action is maintainable for the benefit of the like persons as are entitled under Lord Campbell's act in an action at common law.

The law continued in this condition up to 1897. In the majority of cases of injury to a servant, the doctrine of common employment still protected the master; and where, under the Employers' Liability Act, it failed to do so, the liability was of a limited character and often, owing to technicalities of procedure, difficult to enforce. Moreover, there is nothing in the act to prevent master and servant from entering into any special contract they please; and in many trades it became a common practice for contracts to be made wholly excluding the operation of the act. In 1893 an attempt was made to alter the law by a total abolition of the defence of common employment, so as to make a master as liable to a servant as to a stranger for the negligence of any of his servants acting in the course of their employment, and at the same time to prohibit any agreements to forego the rights so given to the servant. The bill did not become law, and no further change was made until, in 1897, parliament took the first step in what has been a complete revolution in the law of employers' liability. Up to that year, as has been seen, the foundation of a master's liability was negligence, either of the master himself, or, in certain cases, of his servants. But by the Workmen's Compensation Act 1897, a new principle was introduced, whereby certain servants in certain employments were given a right to compensation for injuries, wholly irrespective of any consideration of negligence or contributory negligence. As regards such servants in such employments the master was in the position of an insurer against accidental injuries. The act was confessedly tentative and partial; it dealt only with selected industries, and even within these industries was not of universal application. But where it did apply, it gave a right to a limited compensation in every case of injury by accident arising out of and in the course of the employment, whether that accident had been brought about by negligence or not, and whether the injured servant had or had not contributed to it by his own negligence.

The act applied only to employment on, or in, or about certain localities where, at the same time, the employer was what the act called an "undertaker," that is, the person whose business was there being carried on. If we wanted to know whether a workman was within the act, we had to ask, first, was he employed on, or in, or about a railway, or a factory, or a mine, or a quarry, or an engineering shop, or a building of the kind mentioned in the act; secondly, was he employed by one who was, in relation to that railway, &c., the undertaker as defined by the act; and, thirdly, was he at the time of the accident at work on, or in, or about that railway, &c. Unless these three conditions were fulfilled the employment was not within the act.

The employments to which the act applied comprised railways, factories (which included docks, warehouses and steam laundries), mines, engineering works and most kinds of buildings. A "workman" included every person engaged in an employment to which the act applied, whether by manual labour or otherwise, and whether his agreement was one of service or apprenticeship or otherwise, expressed or implied, oral or in writing.

By the Workmen's Compensation Act 1900, the benefits of the act of 1897 were extended to agricultural labourers.

The Workmen's Compensation Act 1906 (which came into force on the 1st of July 1907) extended the right of compensation for injuries practically to all persons in service, and also introduced many provisions not contained in the acts of 1897 and 1900 (repealed). It does not apply to persons in the naval or military service of the crown (s. 9), or persons employed otherwise than by way of manual labour whose remuneration exceeds
two hundred and fifty pounds a year, or persons whose employment is of a casual nature, and who are employed otherwise than for the purposes of the employer’s trade or business, or members of a police force, or out-workers, or members of the employer’s family dwelling in his house. But it expressly applies to seamen.

To entitle a workman engaged in an employment to which the act applies to compensation all the following conditions must be fulfilled: (1) There must be personal injury by accident. This will exclude injury willfully inflicted, unless the injury results in death or serious and permanent disablement, but the act introduces a new provision by making the suspension or disablement from work or death caused by certain industrial diseases “accidents” within the meaning of the act. The industrial diseases specified in the 3rd schedule of the act are anthrax, ankylostomiasis, and lead, mercury, phosphorus and arsenic poisoning or their sequelae. But § 8 of the act authorized the secretary of state to make orders from time to time including other industrial diseases, and such orders have embraced glass workers’ catarrh, telegraphists’ cramp, eczematous ulceration of the skin produced by dust or liquid, ulceration of the mucous membrane of the nose or mouth produced by dust, &c. To render the employer liable the workman must either obtain a certificate of disablement or be suspended or die by reason of the disease. If the disease has been contracted by a gradual process, all the employers who have employed the workman during the previous twelve months in the employment to which the disease was due are liable to contribute a share of the compensation to the employer primarily liable. (2) The accident must arise out of and in the course of the employment. In each case it will have to be determined whether the workman was at the time of the accident in the course of his employment, and whether the accident arose out of the employment. It will have to be considered whether and where the particular employment began and ended. Other difficulties will arise and will frequently arise when the workman at the time of the accident is doing something which is not part of the work he is employed to do. So far as the decisions have gone, they indicate that if what the workman is doing is no act of service, but merely for his own pleasure, or if he is improperly meddling with that which is no part of his work, the accident does not arise out of and in the course of his employment; but if, while on his master’s work, he upon an emergency acts in his master’s interest, though what he does is no part of the work he is employed to do, the accident does arise out of and in the course of his employment. (3) The injury must be such as disables the workman for a period of at least one week from earning full wages at the work at which he was employed. (4) Notice of the accident must be given as soon as practicable after the happening thereof, and before the workman has voluntarily left the employment in which he was injured; and the claim for compensation (by which is meant notice that he claims compensation under the act addressed by the workman, to the employer) must be made within six months from the occurrence of the accident or, in case of death, from the time of death. Want of notice of the accident or defects in it are not to be a bar to proceedings, if occasioned by mistake or other reasonable cause, and the employer is not prejudiced thereby. But want of notice of a claim for compensation is a bar to proceedings, unless the employer by his conduct has estopped himself from relying upon it. (5) An injured workman must, if so required by the employer, submit himself to medical examination.

When these conditions are fulfilled, an employer who is within the act has no answer unless he can prove that the injury arose from the serious and wilful misconduct of the workman. The precise effect of these terms is not clear; but mere negligence is not within them.

Where the injury causes death, the right to compensation belongs to the workman’s “dependents”; that is, such of the members of the workman’s family as were at the time of the death wholly or in part dependent upon the earnings of the workman for their maintenance. “Members of a family” means wife or husband, father, mother, grandfather, grandmother, step-father, step-mother, son, daughter, grandson, granddaughter, step-son, step-daughter, brother, sister, half brother, half-sister. The act of 1906 makes also a very remarkable departure in including illegitimate relations in the direct line among “dependents,” for where a workman, being the parent or grandparent of an illegitimate child, leaves such a child dependent upon his earnings, or, being an illegitimate child, leaves a parent or grandparent so dependent upon his earnings, such child or parent is to be included in the “members of a family.”

Under the act compensation is for loss of wages only, and is, as has been said, based upon the actual previous earnings of the injured workman in the employment of the employers for whom he is working at the time of the injury. In case of death, if the workman leaves dependents who were wholly dependent on his earnings, the amount recovered is a sum equal to his earnings in the employment of the same employer during the three years next preceding the injury, or the sum of £50, whichever is the larger, but not exceeding £100; if the period of his employment by the same employer has been less than three years, then the amount of his earnings during the three years is to be deemed to be 156 times his average weekly earnings during the period of his actual employment under the said employer. If the workman leaves no dependents, the amount recoverable is the reasonable expenses of his medical attendance and burial, not exceeding £10. In case of total or partial incapacity for work resulting from the injury, what is recovered is a weekly payment during the incapacity after the second week not exceeding 50% of the workman’s average weekly earnings during the previous twelve months, if he has been so long employed, but if not, then for any less period during which he has been in the continuous employment of the same employer; such weekly payment is not to exceed £5—and in fixing it regard is to be had to the difference between the amount of his average weekly earnings before the accident and the average amount which he is able to earn after the accident. Any payments, not being wages, made by the employer in respect of the injury must also be taken into account. The weekly payment may from time to time be reviewed at the request of either party, upon evidence of a change in the circumstances since the award was made, and after six months may be redeemed by the employer by payment of a lump sum. A workman is within the act although at the time of the injury he has been in the employment for less than two weeks, and although there are no actual earnings from the same employer upon which a weekly average can be computed. But how are the average weekly earnings which he would have earned from the same employer to be estimated? The question must be determined as one of fact by reference to all the circumstances of the particular case. Suppose the workman to be engaged at six shillings a day and injured on the first day. If it can be inferred that he would have remained in such employment for a whole week, his average weekly earnings from the same employer may be taken at thirty shillings. If it can be inferred that he would have worked one day and no more, his average weekly earnings from the same employer may be taken at six shillings.

All questions as to liability or otherwise under the act, if not settled by agreement, are referred to arbitration in accordance with a scheme prescribed by the act. Contracting out is not permitted, save in one event: where a scheme of compensation, benefit or insurance for the workmen of an employer has been certified by the Registrar of Friendly Societies to be not less favourable to the workmen and their dependents than the provisions of the act, and that where the scheme provides for contributions by the workmen, it confers benefits at least equal to those provided in addition to the benefits to which the workmen would have been entitled under the act, and that a majority (to be ascertained by ballot) of the workmen to whom the scheme is applicable are in favour of it, the employer may contract with any of his workmen that the provisions of the
scheme shall be substituted for the act; such certificate may not be for more than five years, and may in certain circumstances be revoked. The act does not touch the workman’s rights at common law under the Employers’ Liability Act, but the workman, if more than one remedy is open to him, can enforce only one. When the circumstances create a legal liability in some other person, e.g. where the injury is caused by the negligence of a sub-contractor or of a stranger, in such cases the employer, if required to pay compensation under the act, is entitled to be indemnified by such other person.

Under the Factory Acts, offences, when they result in death or bodily injury to health, may be punished by fine not exceeding £100, and the whole or any part of such fine may be applied for the benefit of the injured person or his family, or otherwise as the secretary of state determines. Similar provisions occur in the Mines Acts. Any sum so applied must be taken into account in estimating compensation under the Employers’ Liability and Workmen’s Compensation Acts.

Law in Other Countries.—In Germany (c.f.) there is a system of compulsory state insurance against accidents to workmen. The law dates from 1884, being amended from time to time (1885, 1886, 1887, 1900, 1903) to embrace different classes of employment. Occupations are grouped into (1) industry; (2) agriculture; (3) building; (4) marine, to all of which one general law, with variations necessary to the particular occupation in question, is applicable. There are also special provisions for prisoners and government officials. Practically every kind of working-man is thus included, with the exception of domestic servants and artisans or labourers working on their own account. All workmen and officials whose salary does not exceed £150 a year come within the law. No compensation is payable where an accident is caused through a person’s own gross carelessness, and where an accident has been contributed to by a criminal act or intentional wrongdoing the compensation may be refused or only partially allowed. With these exceptions, compensation for injury is payable in case of injury so long as the injured is unfit to work; in case of total incapacity an allowance is made equal to two-thirds of the injured person’s annual earnings, in case of partial incapacity in proportion to the degree that his earning capacity has been affected. In case of death the compensation is either burial money or an allowance to the family varying in amount from 20 to 60% of the annual earnings according to circumstances. The provision of compensation for accidents falls entirely upon employers, and in order to lighten the burden thus falling upon them, and at the same time to guard against the possible insolvency of an individual employer, associations or self-administering bodies of employers have been formed—usually all the employers of each particular branch of industry in a district. These associations fix the amount of compensation after each accident, and at the end of the year assess the amount upon the individual employers. There is an appeal from the association to an arbitration court, and in particularly complicated cases there may be a further appeal to the imperial insurance department.

No allowance is paid until after the lapse of thirteen weeks from the accident, and in the meantime the injured person is supported from a sick fund to which the employers contribute one-third of each paid wage, the other two-thirds being paid by the workmen. In Germany there are quite twelve millions of workpeople insured; in 1905 a sum of nearly eight millions sterling was paid for accidents, and a million and a half to the families of those killed in accidents.

In Austria the compulsory insurance of workmen was provided for by a law of 1887, with subsequent amendments. Briefly, nearly every class of industrial worker is included under the Austrian law, which is administered by special territorial insurance institutions, each of them embracing particular classes of industries or workers. The institutions are managed by committees, one-third of the members of each committee being chosen by the minister of the interior, one-third by the employers and one-third by the workers. Compensation is payable, in case of accidents, on a scale proportionate to the injured person’s wages during the preceding year. In case of death, a certain sum is paid for funeral expenses, an annuity to the widow, if one is left, equal to 20% of the deceased’s annual wages—if the widow remarries, she receives a lump sum equal to three annual payments in liquidation of the annuity—an annuity to each legitimate child equal to 15% or, if the child has no mother, equal to 20% of the father’s wages; an annuity to the father or mother, if dependent on the deceased for support, equal to 20% of the annual wages. As in the English act of 1906 illegitimate children are recognized by being granted an annuity in the case of the death of a father equal to 10% of his wages. In no case can the total amount of the annuities exceed 50% of the deceased’s annual wages. Where the accident has resulted in total incapacity, the workman receives an annuity equal to 60% of his wages. No allowance is paid until after the fourth week, during which time the injured is supported by the sick-insurance institutions. The provision for the system is raised by contributions to the extent of nine-tenths by the employers and one-tenth by the workers, deducted from their wages. Instead of the German method by which an annual payment equal to the amount disbursed is required from each employer, he is required to provide the full amount necessary for the complete payment of the annuity, this amount being placed to the credit of a special insurance fund.

In France a system of compulsory state insurance against accidents was created by a law of 1898. The principle feature in the French law is the attempt to meet the possible insolvency of the employer by the establishment of a special guarantee fund, created by a small addition to the “business tax” (contribution des patentes), and, in the case of the mining industry, by a small tax on mines.

Norway, by a law of 1894, amended in 1897 and 1899, adopted a system of compulsory insurance modelled to a great extent on the German system. Instead, however, of a trade association as in Germany, or a district insurance association as in Austria, there is a government insurance office, in which employers have to insure their workmen.

In Denmark a law was passed in 1897 rendering employers personally liable for the amount of compensation for accidents, but employers may relieve themselves of this liability by insuring workmen in an assurance association approved of by the minister of the interior. This course, however, is discretionary with employers.

In Italy, although many attempts were made between 1889 and 1898 to introduce a system of compulsory insurance, it was not until the latter year that the principle was adopted. There is a National Bank for the Insurance of Working men against Accident (Cassa Nazionale di Assicurazione per gli infortuni degli operai sul lavoro), created under a law of 1883. It has special privileges, such as exemption from taxation and the employment of the branch offices of the state post-office savings bank as local offices. Under the law of 1898 there is a primary obligation on the employer to insure his workmen with the National Bank, but he may, if he prefers, insure with other societies approved by government. Employers employing about five hundred workmen may, instead of insuring, establish a fund for the payment of not less than the statutory compensation, subject to giving adequate security for the sufficiency of the fund. Any deduction from compulsory insurance is granted to employers who have established a mutual insurance association, which must comply with certain prescribed conditions. Railway companies, also, are exempt, if they have relief funds which conform with the provisions of the act.

In Spain an act of the 30th of January 1900, adopted the principle of the personal responsibility of the employer for accidents to workmen other than those due to vis major. The act also lays down regulations for preventing accidents in dangerous trades, and releases the employer from personal liability on effecting adequate insurance of his workmen with an approved insurance company.

Holland has adopted the principle of compulsory insurance by a law of the 2nd of January 1901. An employer has to pay the necessary premium to the State Insurance Office, or by depositing adequate security with the State Office he may
undertake the payment of the prescribed compensation himself. Or he may transfer his liability to an insurance company, provided the company deposit adequate security with the State Office. The State Insurance Office is under the management of directors appointed by the crown, and decides on all questions as to compensation; there is also a "Supervisory Board" of the State Office with joint representation of employers and workmen. There is an appeal from the State Office to Councils of Appeal, and from them to a National Board of Appeal.

Greece has a law of the 21st of February 1901, providing for compensation for accidents causing incapacity of more than four days' duration to workmen in mines, quarries, and smelting works. The employer is exclusively liable for such compensation and for medical expenses during the first three months; after that time he is liable for one-half, the other half being borne by a miners' provident fund, supported by certain taxes on the properties affected, fines, &c.

By a law of the 5th of July 1901, Sweden adopted the principle of the personal liability of the employer for industrial accidents. The employer can, however, insure himself against liability by the Royal Insurance Institute. Compensation becomes payable after the expiration of sixty days from the date of the accident.

Russia has a law which came into force on the 1st of January 1904. Under this law employers in certain specified industries are bound to indemnify workers for incapacity of more than three days' duration due to injury arising out of their work. Employers are exempt from liability by insuring their workmen in insurance companies whose terms are not less favourable than those laid down by the law.

Belgium passed a law dealing with industrial accidents on the 24th of December 1903. It adopts the principle of the personal liability of the employer in certain specified trades or industries. There is a power of extension to such other undertakings as may be declared dangerous by the Commission on Labour Accidents. Employers may exempt themselves from their liability by contracting for the payment of compensation by an insurance company approved by the government or by the National Savings and Pension Fund. Where an employer does not do so, he must (with certain exemptions) contribute to a special insurance fund. The law of 1903 also established a permanent Commission on Labour Accidents.

Switzerland in 1899 adopted a law providing for accident insurance, but it was defeated on referendum in May 1900.

In the United States the law mainly depends on the doctrine of common employment, and the extent to which this doctrine is applied varies considerably in the different states, more particularly as to who are and who are not to be regarded as fellow-servants. The tendency, however, has been to increase the liability of the employer for the negligence of a fellow-servant, and in the case of employment on railways many states have passed laws either modifying or abrogating the doctrine. Colorado, by a law of 1901, has entirely abrogated it; and Alabama, Massachusetts and New York have laws generally similar to the English act of 1880. But the greatest departure from the initiative of President Roosevelt, has been the passing by the Federal Congress of the laws of April 22 and May 30, 1908, one giving damages to injured employees of interstate carriers by railroad, and common carriers by railroad in Territories, the District of Columbia, the Canal Zone and other territory governed by Congress, and the other giving regular wages for not more than one year to injured employees of the U.S. government in arsenals, navy yards, construction work on rivers, harbours and fortifications, hazardous work in connection with the Panama Canal or Reclamation Service, and in government manufacturing establishments. These national laws, which were intended to serve as an example to the states, specifically provided for employers' liability and for the non-recognition of the doctrine of common employment.

Most of the British colonial states have adopted the principle of the English Workmen's Compensation Act of 1897, and the various colonial acts are closely modelled on the English act, with more or less important variations in detail. The New Zealand Act was passed in 1900, and amended in 1901, 1902, 1903 and 1905. The act of 1905 (No. 50) fixes the minimum compensation for total or partial disablement at £1 a week when the worker's previous remuneration was less than 30s. a week. South Australia passed a Workmen's Compensation Act in 1900 and Western Australia one in 1902. New South Wales passed one in 1905, and British Columbia in 1902.

**Holland.**

The government itself is under the management of directors appointed by the crown, and decides on all questions as to compensation; there is also a "Supervisory Board" of the State Office with joint representation of employers and workmen. There is an appeal from the State Office to Councils of Appeal, and from them to a National Board of Appeal.

**Sweden.**

The employer can, however, insure himself against liability by the Royal Insurance Institute. Compensation becomes payable after the expiration of sixty days from the date of the accident.

**Russia.**

According to a law of the 5th of July 1901, Sweden adopted the principle of the personal liability of the employer for industrial accidents. The employer can, however, insure himself against liability by the Royal Insurance Institute. Compensation becomes payable after the expiration of sixty days from the date of the accident.

**Belgium.**

Belgium passed a law dealing with industrial accidents on the 24th of December 1903. It adopts the principle of the personal liability of the employer in certain specified trades or industries. There is a power of extension to such other undertakings as may be declared dangerous by the Commission on Labour Accidents. Employers may exempt themselves from their liability by contracting for the payment of compensation by an insurance company approved by the government or by the National Savings and Pension Fund. Where an employer does not do so, he must (with certain exemptions) contribute to a special insurance fund. The law of 1903 also established a permanent Commission on Labour Accidents.

**Switzerland.**

Switzerland in 1899 adopted a law providing for accident insurance, but it was defeated on referendum in May 1900.

In the United States the law mainly depends on the doctrine of common employment, and the extent to which this doctrine is applied varies considerably in the different states, more particularly as to who are and who are not to be regarded as fellow-servants. The tendency, however, has been to increase the liability of the employer for the negligence of a fellow-servant, and in the case of employment on railways many states have passed laws either modifying or abrogating the doctrine. Colorado, by a law of 1901, has entirely abrogated it; and Alabama, Massachusetts and New York have laws generally similar to the English act of 1880. But the greatest departure from the initiative of President Roosevelt, has been the passing by the Federal Congress of the laws of April 22 and May 30, 1908, one giving damages to injured employees of interstate carriers by railroad, and common carriers by railroad in Territories, the District of Columbia, the Canal Zone and other territory governed by Congress, and the other giving regular wages for not more than one year to injured employees of the U.S. government in arsenals, navy yards, construction work on rivers, harbours and fortifications, hazardous work in connection with the Panama Canal or Reclamation Service, and in government manufacturing establishments. These national laws, which were intended to serve as an example to the states, specifically provided for employers' liability and for the non-recognition of the doctrine of common employment.

Most of the British colonial states have adopted the principle of the English Workmen's Compensation Act of 1897, and the various colonial acts are closely modelled on the English act, with more or less important variations in detail. The New Zealand Act was passed in 1900, and amended in 1901, 1902, 1903 and 1905. The act of 1905 (No. 50) fixes the minimum compensation for total or partial disablement at £1 a week when the worker's previous remuneration was less than 30s. a week. South Australia passed a Workmen's Compensation Act in 1900 and Western Australia one in 1902. New South Wales passed one in 1905, and British Columbia in 1902.
EMPYEMA—

EMPYEMAT (Gr. ἐμφύσιον, and πυρω, pus), a term in medicine applied to an accumulation of purulent fluid within the cavity of the pleura (see LUNG: Surgery).

EMPYREAN (from the Med. Lat. empyreus, an adaptation of the Gr. ἐμφύσιον, in or on the fire, πῦρ), the place in the highest heaven, which in ancient cosmologies was supposed to be occupied by the element of fire. It was thus used as a name for the firmament, and in Christian literature for the dwelling-place of God and the blessed, and as the source of light. The word is used both as a substantive and as an adjective. Having the same Greek origin are the scientific words "empyreuma" and "empyreumatic," applied to the characteristic smell of burning or charring vegetable or animal matter.

EMS, a river of Germany, rising on the south slope of the Teutoburgo Wald, at an altitude of 358 ft., and flowing generally north-west and north through Westphalia and Hanover to the east side of the Dollart, immediately south of Emden. After passing through the Dollart the navigable stream bifurcates, the eastern Ems going to the east, and the western Ems to the west, of the island of Borkum to the North Sea. Length, 200 m. Between 1844 and 1869 the river was canalized along its right bank for a distance of 54 miles. At the same general plan, a canal, the DORTMUND-EMS CANAL, was dug to connect the river (from Münster) with Herne in the Westphalian coal-field. At Henrichenburg a branch from Herne (5 m. long) connects with another branch from Dortmünd (10 m. long). Another branch, from Olphen (north of Dortmünd), connects with Duisburg, and so with the Rhine. There is, however, a difference in elevation of 46 ft. between the two branches first named, and vessels are transferred from the one to the other by means of a huge lift. The canal, which was constructed to carry small steamers and boats up to 220 ft. in length and 750 tons burden, measures 169 ft. in length, of which 108 ft. were actually dug, and cost altogether £57,285,750. The surface width throughout is 30 ft., the bottom width 59 ft., and the depth 3 ft.

EMSB, a town and watering-place of Germany, in the Prussian province of Hesse-Nassau, romantically situated on both the banks of the Lahn, in a valley surrounded by wooded mountains and vine-clad hills, 11 m. from Coblenz on the railway to Cassel and Berlin. Pop. 6500. It has two Evangelical, a Roman Catholic, an English and a Russian church. There is some mining industry (silver and lead). Ems is one of the most delightful and fashionable watering-places of Europe. Its warm, alkaline springs, about twenty in number, are used both for drinking and bathing, and are efficacious in chronic nervous disorders, feminine complaints and affections of the liver and respiratory organs. On the right bank of the river lies the Kurasal with pretty gardens. A stone jetty into the promenade close by marks the spot where, on the 13th of July 1780, King William of Prussia had the famous interview with the French ambassador Count Benedetti (q.v.) which resulted in the war of 1870-1871. A funicular railway runs up to the Malberg (1000 ft.), where is a sanatorium and whence extensive views are obtained over the Rhine valley. Ems is largely frequented in the summer months by visitors from all parts of the world—the numbers amounting to about 11,000 annually—and many handsome villas have been erected for their accommodation. In August 1786 Ems was the scene of the conference of the delegates of the four German archbishops, known as the congress of Ems, which issued (August 23) in the famous joint pronounce-ment, known as the Punctuation of Ems, against the interference of the papacy in the affairs of the Catholic Church in Germany (see FEBRONTIVIA). See Vogler, Ems, seine Heiligungen, Kurfürstungen, &c. (Ems, 1888); and Hess, Zur Geschichte der Stadt Ems (Ems, 1895).

EMSER, JEROME, or HIERONYMUS (1477-1527), antagonist of Luther, was born of a good family at Ulm on the 20th of March 1477. He studied Greek at Tübingen and jurisprudence at Basel, and after acting for three years as chaplain and secretary to Raymond Peraud, cardinal of Gurk, he began lecturing on classics in 1504 at Erfurt, where Luther may have been among his audience. In the same year he became secretary to Duke George of Albertine Saxony, who, unlike his cousin Frederick the Wise, the elector of Ernestine Saxony, remained the staunchest defender of Roman Catholicism among the princes of northern Germany. Duke George at this time was bent on securing the canonization of Bishop Benno of Meissen, and at his instance Emser travelled through Saxony and Bohemia in search of materials for a life of Benno, which he subsequently published in German and Latin. In pursuit of the same object he made an unsuccessful visit to Rome in 1510. Meanwhile he had also been lecturing on classics at Leipzig, but gradually turned his attention to theology and canon law. A prebend at Dresden (1509) and another at Meissen, which he obtained through Duke George's influence, gave him means and leisure to pursue his studies.

At first Emser was on the side of the reformers, but like his patron he desired a practical reformation of the clergy without any doctrinal breach with the past or the church; and his liberal sympathies were mainly humanistic, like those of Erasmus and Johan Luther. In 1519 Emser and his master company with Luther after 1519. As late as that year Luther referred to him as "a most excellent Ems clerico," but the disputation at Leipzig in that year completed the breach between them. Emser warned his Bohemian friends against Luther, and Luther retorted with an attack on Emser which outdid in severity all his polemical writings. Emser, who was further embittered by an attack of the Leipzig students, reiterated Luther's violence, and asserted that Luther's whole crusade originated in nothing more than enmity to the Dominicans. Luther's reply was to burn Emser's books along with Leo X.'s bull of excommunication.

Emser next, in 1521, published an attack on Luther's "Appeal to the German Nobility," and eight works followed from his pen in the controversy, in which he defended the Roman doctrine of the Mass and the primacy of the pope. At Duke George's instance he prepared, in 1523, a German translation of Henry VIII's "Assertio Septem Sacramentorum contra Lutherum," and criticized Luther's "New Testament." He also entered into a controversy with Zwingli. He took an active part in organizing the Reformed Church in Germany, and in 1527 published a German version of the New Testament as a counterblast to Luther's. He died on the 5th of November in that year and was buried at Dresden.

Emser was a vigorous controversialist, and next to Eck the most eminent of the German divines who stood by the old church. But he was hardly a great scholar; the errors he detected in Luther's New Testament were for the most part legitimate variations from the Vulgate, and his own version is merely Luther's adapted to Vulpian requirements.

ENAMEL (formerly "amel," derived through the Fr. emal, esmal, esmol, from the Latin word smalum, first found in a 9th-century Life of Louis IV. of France, strictly speaking, given to the hard vitreous compound, which is "shaped or fashioned" into one of metallic objects either for the purpose of decoration or utility. This compound is a form of glass made of silica, minium and potash, which is stained by the chemical combination of various metallic oxides whilst in a melted condition in the crucible. This strict application of the term was widened to signify the metal object coated with enamel, so that to-day the term "an enamel" generally implies a work of art in enamel upon metal. The composition of the substance enamel which is used upon metal is not to vary to any great extent from the enamels employed upon pottery and faience. But they differ in this respect, that the pottery enamel is usually applied to the
"biscuit" surface of the ware in a raw state; that is, the compound has not been previously "run down" or vitrified in the crucible by heat, as is the case with enamelling upon metal, although, in most of the enamelled iron advertisement tablets, the enamel is in the raw state and is treated in a similar manner to that employed upon pottery.

Examination of the enamels upon brick of the Assyrians shows that they were applied unvitrified. It was upon pottery and brick that the ancient Egyptians and Assyrians achieved their greatest work in enamelling. For as yet no work of such magnificence as the great enamelled walls of the palace of Ramesses III. at Tell el-Yehudia in the Delta of the Nile, or the palace of Nimrod in Babylon, has been discovered upon metal of any kind. But there were gold ornaments and jewelry enamelled of noble design in opaque turquoise, cobalt, emerald green and purple, some of which can be seen at the British Museum and the Louvre. An example is shown in Plate I. fig. 3.

In the subsequent Greek and Roman civilizations enamel was also applied to articles of personal adornment. Many pieces of jewelry, exquisite in workmanship, have been found. But a greater application was made of it by the Greek sculptors in the fifth and sixth centuries B.C. For we find, in many instances, that not only were the eyes made of enamel—which (artistically speaking) is a somewhat doubtful manner of employing it, as in the fine bronze head found at Anticythera (Cerigot) in 1902, but in the colossal figure of Zeus for the temple at Olympia made by Pheidias the gold prong was gaudy enamelled with figures and flowers. This wonderful work by the greatest sculptor the world has ever seen was destroyed, as so many priceless works of art in enamel have been: doubtless on account of the precious metal upon which they were made. It was in all probability the crowning triumph of a long series of essays in this material. The art of ancient Rome lacked the inspiration of Greece, being mainly confined to copying Greek forms and style, and in the case of enamelling it did not depart from this attitude. But the Roman and Etruscan glass has many beautiful qualities of form and colour that do not seem entirely borrowed, and the enamel work upon them so far as we can discern is of graceful design and rich colour. Doubt, were it not, as has been remarked, for the fact that enamelling was generally done upon silver, there would still be many works testifying to the art of that period. Such as there are, however, show a rare appreciation of enamel as a beautiful material. With the decline of this civilization the art of enamelling probably died out. For it has ever been one of those exquisite arts which exist only under the sunshine of an opulent luxurious time or sheltered from the rude winds of a poorer age by the affluence of patrons. The next time we hear of it is in an oft-quoted passage (c. A.D. 240) from the writings of the great sophist Philostratus, who says (Icones, i. 28):—"It is said that the barbarians in the ocean pour these colours into bronze moulds, that the colours become as hard as stone, preserving the designs,"—a more or less inaccurate description of the process of champlevé. This has been understood (from an interpretation given to a passage in the commentary on it by Olearius) to refer to the Celts of the British Islands. It also goes to prove that enamelling was not practised at this day in Greece. We have no British enamels to show so early as this, but belonging to a later period, from the 6th to the 9th century, a number of the finest gold and bronze enamelled and cloisonné pieces are known. The enamels of the late 13th century have been discovered of Celic and Saxen make. The Saxen work has nothing to show so exquisite as that found in Ireland, where one or two pieces are to be seen now in the Dublin Museum, notably the Ardagh chalice and some gold brooches. In the chalice the enamel is of a minute inlaid character, and appears to have been made first in the form of a multi-colour bead, which was fused to the surface of its setting, and then polished down. Many of the pieces seem to have been made after this fashion, which does not speak very highly of the technical knowledge of enamelling, but it is none the less true enamelling of an elementary character. The shield at the British Museum has an inlay of red enamel which is remarkable in its quality.

For centuries such a fine opaque red has not been discovered. An example of Irish work is shown in Plate II. fig. 10.

From Ireland the art was transferred to Byzantium, which is to be seen by the close resemblance of method, style, design and colour. The style and design changed in course of time, but the craft remained. It was at Byzantium that it flourished for several centuries.

The finest work we know of belonging to this period is the Pala d'Oro at St Mark's, Venice, believed to have been brought from Constantinople to Venice about 1105. This magnificent altar-piece is in cloisonné enamel. A typical example is the ciborium and chalice belonging to the South Kensington loan collection. The design entirely covers the whole of the surface in one rich mass composed of circular or vesica-shaped medallions filled with sacred subjects and foliated scrolls. These are engraved and enamelled, and the metal bands of the scrolls and figures are engraved and gilt. The characteristic quality of the colour scheme is that it is composed almost wholly of primaries. Red, blue and yellow predominate, with a little white and black. Occasionally the secondaries, green and purple, are used, but through the whole period of Byzantine enamelling there is a total absence of what to-day is termed "subtle colouring." The arrangement of the enamels is also distinct, in that

FIG. 1.—Byzantine Cloisonné Cross (c. 11th century) (South Kensington Museum).
are placed. In spite of this, the sense of decorative design, the simplicity of conception, the strength of the general character, and the richness of the colour, places this period as one of the finest which the art of enamelling has seen, and it leads us to lay stress upon the principle that the simplest methods in design and manipulation attain a higher end than those which are elaborate and intricate. It might be asserted with truth that this style never arrived at the degree of delicacy and refinement of later styles. But the refinement was often at the expense of higher qualities.

The next great application of these kinds of enamelling was at Cologne, for there we find not only the renowned work of Nicolas Verdun, the altar front at Klosterneuberg, which consists of fifty plates in champlevé enamel, but in that to Rhenish province there are many shrines of magnificent conception. From here the secrets of the craft were taken to Limoges, where the greatest activity was displayed, as numerous examples are found throughout England, France and Spain, which no doubt were made there (see Plate I. fig. 6.) But no new method or distinct advance is to be noticed, during these successive revivals at Byzantium, Cologne or Limoges, and it is to early 14th-century Italy that we owe one of the most beautiful developments, that of the less frequent type known as Grisaille, which is a low-cut relief upon which transparent enamel is fused.

In this process enamelling passed from a decorative to a fine art. For it demanded the highest knowledge of an artist with the consummate skill of both sculptor and enameller. Witness the superb gold cup, called the King’s Cup, now in the British Museum, and the silver cup at King’s Lynn. The first is an excellent state of preservation, as it is upon gold, but the latter, like most of the ancient enamelling upon silver, has lost most of its enamel. This was due—as the present writer believes after much experiment—to the impurity of the silver employed. The King’s Cup is one of the finest works in enamelling extant. It consists of a gold cup and cover, hammered out of pure gold; and around the bowl, base and cover there are bands of figures, illustrating the scenes from the life of St. Agnes. The hands and faces are of pale jasper, which over the carved gold gives a beautiful flesh tone. The draperies are in most resplendent ruby, sapphire, emerald, ivory, black and orange. The stem was subsequently altered by an additional piece inserted and enamelled with Tudor roses. It is a work of the 13th century, and attributed to Antoinette de Berry, who gave it to his nephew, Charles VI. of France, in 1391. It afterwards came into the possession of the kings of England, from Henry VI. to James I., who gave it to Don Juan Velasco, constable of Castile. It was purchased by subscription with the aid of the treasury for the British Museum.

Other well-known pieces are the silver horn in the possession of the marquess of Aylesbury, and the crozier of William of Wykeham at New College, Oxford. The discovery about the same time of the process called plique-à-jour forms another most interesting and beautiful development. Owing to the difficulty of its manufacture and its extreme fragility there are very few examples left. One of the finest specimens is now at the Victoria and Albert Museum, South Kensington. It is in the form of two bands of emerald green enamel which decorate a silver beaker. They are in the form of little stained glass windows, the cloisons forming (as it were) the leads. These fine cloisons and shapes are most correct in form, and the whole piece shows a perfection of craftsmanship rarely equaled. During the 15th century there was a development in enamelling which was not only remarkable, but revolutionary in its method. For until then the whole theory of enamelling had been that it relied upon the enclosing edges of the metal or the cloison to hold it to the metal ground and in part to preserve it in the shape of the pattern, much in the same way as a setting holds a stone or a jewel. All the enamel before this date had been sunk into cells or cloisons. Two discoveries were made; first, that enamels could be made which require no enclosing ribbon of metal, but that merely the enamel should be fused on both sides of the metal object; secondly, that after an enamel had been fused to a surface of metal, another could be superimposed and fused to the first layer without any danger of separation from each other from the metal ground. It is true that such processes had been employed upon glass on which enamel had been applied, as well as upon pottery; and it is probably due to the influence of a knowledge of both enamelling upon metal and upon glass or pottery that the discovery was made.

In most of these enamel paintings the subject was laid on with a white enamel upon a dark ground. The white was modulated; so that possessing a slight degree of translucency, it was grey in the thin parts and white in the thick. Thus was obtained a certain amount of light and shade. This gave the process called Grisaille. But strange to say, it was not until a later period that this was practically preserved and the modeling of the figures and draperies became very elaborate. At first it was only done in a slight degree, just sufficiently to give expression and to add to the richness of the form. For the enamellers were thinking of a plate upon which to put their wonderful colours, and not only of form. The painting in white was therefore invariably coloured with enamels. Probably the earliest painter in enamel was Nardon Pénicaud, many of whose works (one of them, dated 1503, is in the Cluny Museum) were made in Grisaille. He was the most distinguished of whom was Léonard Limosin (i.e. of Limoges). He excelled in portraiture. Examples of his work (between 1532 and 1574) are to be found in most of the larger public and private collections. Léonard Limosin and his contemporaries were very largely addicted to the employment of foil, which became largely used, thus spoiling their otherwise fine serious work.

The family of Jean Pénicaud, Jean Court de Vigier, Pierre Raymond and Pierre Courteys were all great names of artists who excelled in the Grisaille process. Grisaille is similar to pâte-sur-pâte in pottery, and depends for its attractive quality entirely upon form and composition. No comparison should be made with enamels in colour, for they occupy a different category—similar to cameo.

The casket shown in Plate II. fig. 6 is by Jean Pénicaud. It is a fine example of the enamelling in this style, very beautiful in colour. The hands and faces are in opaque white enamel; the draperies, garlands and flowers are in transparent green, the draperies of the figure purple and cobalt over foil. The background is in transparent violet over white enamel ground, which is smect with gold stars. The draperies are also heightened with gold.

One of the most marvellous pieces of brilliant craft is the missal cover (Plate I. fig. 5) at the South Kensington Museum, said to have belonged to Henrietta Maria, queen of Charles I. The subjects are the “Creation of Adam and Eve” and the “Fountain of Youth.” It is about 4 in. by 7 when opened out. The enamel is encrusted upon the figures, ornaments and flowers which are beaten up in pure gold into high relief. The extraordinary minuteness and skill of handling, and the extreme brilliancy of the enamels, which are as brilliant to-day as on the day they were made, together form one of the unique specimens of art craftsmanship of the world. To the subdued taste of to-day, however, the effect is tawdry. The conception and design are also alike unworthy of the execution.

Since the Assyrian and Egyptian civilizations, there has been a succession of luxurious developments followed by lapses into the decline and death of the art of enamelling upon metals. In each case something was added to that which was known and practised before. The last revival took place five hundred years ago, accompanying the rebirth of learning and the arts; but after flourishing for over a century, the art gradually fell into disuse, and remained so until the recent revival and further development. The development consists, first, in the more complete knowledge of the technical processes, following upon the great advances which science has made; and secondly, in a finer and more subtly artistic treatment of them. The advance in technical knowledge comprises greater facility and perfection in the production of the substance enamel,

and its subsequent application to metal surfaces; more intimate knowledge of metals and their alloys to which it is applied, and greater ease in obtaining them from the metalliferous ores and reducing them to suitable dimensions and surfaces. For instance, it is now a simple matter to obtain perfectly pure copper by means of electricity. Formerly, a flake sheet of metal was obtained by hammering, which involved an infinite amount of hard labour, whereas it is accomplished to-day with ease by means of flating and rolling mills: i.e. after the metal has been obtained from the ore in the form of an ingot, it is stretched equally to any degree of thinness by steel rollers. Further, the furnaces have been greatly improved by the introduction of gas and electricity as the heating power, instead of the wood or charcoal employed.*

In the manufacture of the substance enamel a much greater advance has been made, for whereas the colours, and consequently the schemes of colour, were extremely limited, we now possess an infinite gradation in the colours, as well as the transparency and opacity, the hardness and softness of enamels. There are only two colours which cannot yet be obtained; these are opaque vermilion and lemon yellow in a vitrified state. Many of the colours we now employ were not known by enamellers such as Léonard Limosin. Our enamels are also perfect in purity, brilliancy and durability, qualities which are largely due to the perfect knowledge of the proportion of parts composing an enamel and their complete combination. It is this complete combination, together with the absence of any destructible matter, which gives the enamel its lasting quality.

The base of enamel is a clear, colourless, transparent vitreous compound called flux, which is composed of silica, minium and potash. This flux or base—termed fondant in France—is coloured by the addition of oxides of metals while in a state of fusion, which stain the flux throughout its mass. Enamels are either hard or soft, according to the proportion of the silica to the other parts in its composition. They are termed hard when the temperature required to fuse them is very high. The harder the enamel the less liable is it to be affected by atmospheric agencies, which in soft enamels produce a decomposition of the surface first and ultimately of the whole enamel. It is therefore advisable to use hard enamels in all cases. This involves the employment of pure—or almost pure—metals for the plates, which are in most respects the best to receive and retain the enamel. For if there is an excess of alloy, either the metal will possibly melt before the enamel is fused or afterwards they will part company. To the inferior quality of old silver may be attributed the fact that in all cases the enamel has flown off it; if it has not yet wholly disappeared it will scale off in time. It is therefore essential that metals should be pure and the enamels hard. It is also noteworthy that enamels composed of a great amount of soda or potash, as compared with those wherein red lead is in greater proportion, are more liable to crack and have less cohesion to the metals. It is better not to use silver as a base, although it is capable of reflecting a higher and more brilliant white light than any other metal. Fine gold and pure copper as thin as possible are the best metals upon which to enamel. If silver is to be used, it should be fine silver, treated in the methods called champlevé and cloisonné.

The brilliancy of the substance enamel depends upon the perfect combination and proportion of its component parts. The intimacy of the combination depends upon an equal temperature being maintained throughout its fusion in the crucible. For this purpose it is better to obtain a flux which has been already fused and most carefully prepared, and afterwards to add the colouring oxides, which stain it dark or light according to the amount of oxide introduced. Many of the enamels are changed in colour by the difference of the proportion of the parts composing the flux, rather than by the change of the oxides. For instance, turquoise blue is obtained from the black oxide of copper by using a comparatively large proportion of carbonate of soda, and a yellow green from the same oxide by increasing the proportionate amount of the red lead. All transparent enamels are made opaque by the addition of calx, which is a mixture of tin and lead calcined. White enamel is made by the addition of stannic and arsenous acids to the flux. The amount of acid regulates the density or opacity of the enamel.

To elucidate the development which has occurred, it will be necessary to describe some of the processes. After the enamel has been procured in the lump, the next stage in the process, common to all methods of enamelling, is to pulverize it. To do this properly the enamel must first be placed in an agate mortar and covered with water; next, with a wooden mallet a number of sharp blows must be given to a pestle held vertically over the enamel, to break it; then holding the mortar firmly in the left hand, the pestle must be rotated with the right, with as much pressure as possible on the enamel, grinding it until the particles are reduced to a fine grain. The powder is then subjected to a series of washings in distilled water, until all the fluffy particles are removed. After this the metal is cleaned by immersion in acid and water. For copper, nitric acid is used; for silver, sulphuric, and for gold hydrochloric acid. All trace of acid is then removed, first by scratching with a brush and water, and finally by drying in warm oak sawdust. After this the pulverized enamel is carefully and evenly spread over those parts of the metal designed to receive it, in sufficient thickness to cover them and no more. The piece is then dried in front of the furnace, and when dry is placed gently on a fire-clay or iron planche, and introduced carefully into the muffle of the furnace, which is heated to a bright pale red. It is now attentively watched until the enamel shines all over, when it is withdrawn from the furnace. The firing of enamel, unlike that of glass or pottery, takes only a few minutes, and in nearly all processes no annealing is required.

The following are the different modes of enamelling: champlevé, cloisonné, basse-taille, plaque-d'our, painted enamel, encrusted, and miniature-painted. These processes were known at successive periods of ancient art in the order in which they are named. To-day they are known in their entirety. Each has been largely developed and improved. No new method has been discovered, although variations have been introduced into all. The most important are those connected with painted enamels, encrusted enamels and plaque-d'our.

Champlevé enamelling is done by cutting away troughs or cells in the plate, leaving a metal line raised between them, which forms the outline of the design. In these cells the pulverized enamel is laid and then fused; afterwards it is filed with a corundum file, then smoothed with a pumice stone and polished by means of crocus powder and rouge. An example is shown in Plate II. fig. 8.

In cloisonné enamel, upon a metal plate or shape, thin metal strips are bent to the outline of the pattern, then fixed by silver solder or by the enamel itself. These strips form a raised outline, giving cells as in the case of champlevé. The rest of the process is identical with that of champlevé enamelling. An example is shown in Plate I. fig. 4.

The basse-taille process is also a combination of metal work in the form of engraving, carving and enamelling. The metal, either silver or gold, is engraved with a design, and then carved into a bas-relief (below the general surface of the metal like an Egyptian bas-relief) so that when the enamel is fused it is level with the uncarved parts of the design enamel, and the design shows through the transparent enamel.

Painted enamels are different from any of these processes both in method and in result. The metal in this case is either copper, silver or gold, but usually copper. It is cut with shears into a plate of the size required, and slightly domed with a burnisher or hammer, after which it is cleaned by acid and water. Then the enamel is laid equally over the whole surface both back and front, and afterwards “fired.” The first coat of enamel being fixed, the design is carried out, first by laying it in white enamel or any other which is opaque and most advantageous for subsequent coloration.

In the case of a grisié painted enamel the white is mixed with water or turpentine, or spike oil of lavender, or essential oil of petroleum (according to the taste of the artist) and the white is painted thickly in the light parts and thinly in the grey ones,
whereby a slight sense of relief is obtained and a great degree of light and shade.

In coloured painted enamels the white is coloured by transparent enamels spread over the grisaille treatment, parts of which when fired are heightened by touches of gold, usually painted in lines. Other parts can be made more brilliant by the use of foil, over which the transparent enamels are placed and then fired. An example is shown in Plate I. fig. 7.

Enamels by the plique-à-jour method might be best described as translucent cloisonné enamels; for they are similar to cloisonné, except that the ground upon which they are fired is removed, thus making them transparent like stained glass.

Two new processes have been the subject of the present writer's study and experiment for several years, which he has lately brought to fruition. The first is an inlay of transparent enamels similar to plique-à-jour without cloisons to divide the colours. For if enamels do not run together whilst in a melted state, as is seen in the case of painted and basse-taille enamels, there should be no necessity for it in this process. The result is a clear transparent subject in colour. The other process consists of a coloured enamel relief. It resembles the della Robbia relief, with this important difference, that the colour of the enamel by its nature permeates the whole depth of the relief, whereas in the della Robbia ware it is only on the surface. It also has a fresco surface, instead of one highly glazed. The quality of the enamel is as rare and unlike anything else as it is beautiful. It is in point of fact the only coloured sculpture in which the whole of its parts are one solid homogeneous mass, and through which the colour is one with the substance and is not applied. The process consists of the shapes of the various parts of the relief being selected for the different enamels, and the enamels melted together, in the mould of the relief, which is finished with lapidary's tools.

Miniature enamel painting is not true enamelling, for after the white enamel is fused upon the gold plate, the colours used are not vitreous compounds—not enamels in fact—as is the case in any other form of metal enamelling; but they are either raw oxides or other forms of metal, with a little flux added, not combined. These colours are painted on the white enamel, and afterwards made to adhere to the surface by partially fusing the enamel, which when in a state of partial fusion becomes viscous.

There are many of these so-called enamels to-day, which are much easier of accomplishment than the true enamel, but they possess none of the beautiful quality of the latter. It is most apparent when parts of a work are true enamels and parts are done in the manner described above. These enamel paintings on enamel are afterwards coated over with a transparent flux, which gives them a surface of enamel. Many are done in this way for the market.

All these methods were used formerly, before the present revival; but they were not so completely understood or carried so far as they are to-day. Nor were the whole methods practised by any artist as they are now. The greatest advance has been in painted enamels. This process requires that both sides of the metal plate shall be covered with enamel; for this reason the plate is made convex on the top, so that the concave side does not touch the planche on which it is supported for firing, but rests on its edges throughout. There are several reasons why these plates are bombardé, the principal one being that in firing they resist the tendency to warp and curl up at the edges as a flat thin plate would do. Further, the enamel having been fused to both sides is not so liable to crack or to split in subsequent firings. This is most important, for otherwise the white which is placed on afterwards would be a network of cracks. The manner of firing has also to do with this, but not nearly so much as the preliminary care and mechanical perfection with which a plate is prepared. Nearly all the old enamels are seen to be cracked in the white if minutely examined. To obviate this the following points must be observed: The plate must be of an excellent quality of metal, equal in thickness throughout, and perfectly regular in shape. It must be arched equally from end to end. The first coat of enamel must be of a perfectly regular equal thickness on the plate, entirely covering the plate. Whatever the medium employed in painting the white on to the enamel, it must be completely evaporated before the plate is placed in the furnace. The furnace must be heated to a bright red heat, and the planche must be red-hot before being taken out for the enamel to be placed upon it, and then quickly returned to the furnace and the muffle door shut tight so as to allow no draught of cool air to enter it. Then as soon as it has begun to fuse, which if a small piece, it would do in a minute or so, the muffle door is slightly opened to afford a view of it. As soon as it shines all over its surface, it is withdrawn from the muffle.

The method of laying a white upon the enamel ground is a matter of individual taste, so far as the medium is concerned. By some, pure distilled water is preferred to any other liquid for mixing the enamel. Otherwise, turpentine and the fat oil of turpentine, as well as spike oil of lavender. The oil mixture takes longer to dry, and thus gives a greater chance for modelling into fine shades than the water. But it has several drawbacks. Firstly, there is the difficulty of drying the oil out—a process which takes some time and increases the risk of cracking in the drying process; and secondly, the enamel is not so fresh and clear after it is dried as when pure water has been employed. Besides there is a great difference in the result; the water involves a quick, decided, direct touch and method, which carries with it its own charm. The oil medium, besides giving an effect of laborious rounded stippled surfaces, is apt partly to reduce the enamel, thus giving it a dull surface. The coloration of the white is comparatively simple and is done by transparent enamels finely ground and evenly spread over the white after the latter has been fused. The only danger to be avoided is that of over-firing, which is produced by too great heat of a prolonged duration of firing, which causes the stannic and arsenious acids in the white to volatilize.

Plique-à-jour enamelling is done in the same way as cloisonné enamelling, except that the wires or strips of metal which enclose the enamel are not soldered to the metal base, but are soldered to each other only. Then these are simply placed upon a sheet of platinum, copper, silver, gold or hard brass, which, after the enamel is fused and sufficiently annealed and cooled, is easily removed. For small pieces of plique-à-jour there is no necessity to apply any metallic base, as the particles of enamel quickly fuse, become viscous, and when drawn out set quite hard. Neither is there any need for annealing, as would be the case in larger work. For an example, see fig. 2.

Commercially there has lately been an activity in enamels such as has never before occurred. This has been the case throughout Europe, Japan and the United States of America. In London there has been a demand for a cheap form of gaudy coloured enamel, fused into sunk spaces of metal obtained by stamping with a steel die; this has been applied to small objects

![Fig. 2.—Modern French plique-à-jour bowl, by Fernand Thesmar.](image-url)
of cheap jewelry, in the form of brooches, bracelets, and the like. There has also been a great demand for enamelled watch-cases and small pendants, done mainly by hand, of a better class of work. Many of these have been produced in Birmingham, Berlin, Paris and London. In Paris copies of pictures in black and white enamel, with a little gold paint in the draperies and background, have been manufactured in very large quantities and sometimes of great dimensions. Another curious demand, followed by as astonishing a production, is that of the imitations (a hard name for which is "forgery") of old enamels, made with much skill, giving all the technical excellence of the originals, even to the cracks and scratches incidental to age. These are duly signed, and will deceive the most expert.

They are copies of enamels by Nardon and Jean Pénicaud, Léonard Limosin, Pierre Raymond, Courtois and others. The same artificers also produce copies of old Chinese cloisonné and champlevé enamels, as well as old Battersea enamel snuff-boxes, patch-boxes, and indeed every kind of enamelling formerly practised. It is advisable for the collector never to purchase any piece of enamelling as the work of an old master without having a pedagogue extending at least one or two years. From this, there has been a continuous flow of cloisonné enamelled vases, boxes, and plates, either entirely covered with enamel or applied in parts. Compared with this enormous output, only a few small pieces of jewelry have come from Jaipur and other towns in India. There has also been a great quantity of piqué-à-jour enamelling manufactured in Russia, Norway and Sweden. And finally, it has been used in an unprecedented manner in large pieces upon iron and copper for purposes of advertisement.

Amongst the chief workers in the modern revival of this art are Claudius Popelin, Alfred Meyer, Paul Grandhomme, Fernand Theismar, Hubert von Herkomer and Alexander Fisher. The work of Claudius Popelin is characterized by good technical skill, correctness, and a careful copying of the work of the old masters. Consequently it suffers from a lack of invention and individuality. His work was devoted to the rendering of mythological subjects and fanciful portraits of historical people. Alfred Meyer and Grandhomme are both accomplished and careful enamellers; the former is a pasty enamel, the latter an author of a book dealing technically with enamelling. Grandhomme paints mythological subjects and portraits in a very tender manner, with considerably more artistic feeling than either Meyer or Popelin. There is a specimen of his work in the Luxembourg Museum. Fernand Thesmar is the great reviver of piqué-à-jour enamelling in France. Specimens of his work are possessed by the art museums throughout Europe, and one is to be seen in the Victoria and Albert Museum, London. They are principally valued on account of their perfect technical achievement.

Lucien Falize was an employer of artists and craftsmen, and to him we are indebted for the production of specimens of basse-taille enamel upon silver and gold, as well as for a book reviewing the revival of the art in France, bearing particularly on the work of Claudius Popelin. Until within recent years there was a clear division between the art and the crafts in the system of producing art objects. The artist was one person and the workman another. It is now acknowledged that the artist is in the main responsible, especially in the highest branches of enamelling. M. Falize initiated the production of a gold cup which was enamelled in the basse-taille manner. The band of figures was designed by Olivier Merson, the painter, and carved by a metal carver and enamelled by an enameller, both able craftsmen employed by M. Falize. Other pieces of enamelling in champlevé and cloisonné were also produced under his supervision and on this system; therefore lacking the one quality which would make them complete as an expression of artistic emotion by the artist's own hands. M. René Lalique is one of the jewellers who have applied enamelling to their work in a peculiarly technically perfect manner. In England, Professor Hubert von Herkomer has produced painted enamels of considerable dimensions, aiming at the execution of pictures in enamel, such as have been generally regarded as peculiar to the province of oil or water-colour painting. Among numerous works is a large shield, into which plaques of enamel are inserted, as well as several portraits, one of which, made in several pieces, is 6 ft. high, the gift of the emperor William II. of Germany. The present writer rediscovered the making of many enamels, the secrets of which had been jealously guarded. He has worked in all these processes, developing them from the art side, and helping to make enamelling not only a decorative adjunct to metal-work, but raising it to a fine art. His work may be seen in the Victoria and Albert Museum, and Brussels Museum. Others who have been enamelling with success in various branches, and who have shown individuality in their work, are Mr John Eyre, Mrs Nelson Dawson, Miss Hart.

LITERATURE.—Among older books on enamelling, apart from the works of Neri and Benvenuto Cellini, are J.-P. Foucault, L'Art du feu, ou de peindre en émail (1721); Labarte, Recherches sur la peinture en émail (Paris, 1856); Marquis de Laborde, Notice des émaux du Louvre (Paris, 1852); Reboulleau, Nouveau manuel complet de la peinture en terre, sur porcelaine et sur émail (éd. by Magnenot, Paris, 1895); Claudius Popelin, L'Émail des peintres (Paris, 1866); Emil Molinier, Dictionnaire des émaillers (1884). Among useful recent books are H. Cunyngham's Art of Enamelling on Metals (1906); L. Falize, Claudius Popelin et la renaissance des émaux de peintre; L. Dalpayrat, L'Art Nouveau; Alexander Fisher, The Art of Enamelling upon Metal (1906, "The Studio," London).

ENCAENIA, a festival commemorating a dedication, in Greek τὰ ἐνακείναι (καῦσος, new), particularly used of the anniversary of the dedication of a church (see DEDICATION). The term is also used at the university of Oxford of the annual Commemoration, held in June, of founders and benefactors (see OXFORD).

ENCAUSTIC PAINTING. The name encaustic (from the Greek for "burnt in") is applied to paintings executed with vehicles in which wax is the chief ingredient. The term was appropriately applied to the ancient methods of painting in wax, because these required heat to effect them. Wax may be used as a vehicle for painting without heat being requisite; nevertheless the ancient term encaustic has been retained, and is indiscriminately applied to all methods of painting in wax. The durability of wax, and its power of resisting the effects of the atmosphere, were well known to the Greeks, who used it for the protection of their sculptures. As a vehicle for painting it was commonly employed by them and by the Romans and Egyptians; but in recent times it has met with only a limited application. Of modern encaustic paintings those by Schnorr in the Residenz at Munich are the most important. Modern paintings in wax, in their chromatic range and in their general effect, occupy a middle place between those executed in oil and in fresco. Wax painting is not so easy as oil, but presents fewer technical difficulties than fresco.

Ancient authors often make mention of encaustic, which, if it had been described by the word inure, to burn in, one might have supposed to have been a species of enamel painting. But the expressions "incausto pingere," "pictura encaustica," "ceris pingere," "pictura inure," used by Pliny and other ancient writers, make it clear that some other species of painting is meant. Pliny distinguishes three species of encaustic painting. In the first they used a stylus, and painted either on ivory or on polished wax, which, previously saturated with wax, were the object of the stylus or stick employed for this operation, and its broad or blade end cleared off the small filaments which arose from the outlines made by the stylus in the wax preparation. In the second method it appears that the wax colours, being prepared beforehand, and formed into small cylinders for use, were smoothly spread by the spatula after the outlines were determined, and thus the picture was proceeded with and finished. By the side of the painter stood a brazier which was used to heat the spatula and probably the prepared colours. This is the method which was probably used by the painters who decorated the houses of Herculaneum and of Pompeii, as artists practising this method of painting are depicted in the decorations. The third method was by painting by a brush dipped into wax liquefied by heat; the colours so applied attained considerable hardness, and could not be damaged either by the heat of the sun or by the effects of sea-water. It was thus that ships were
decorated; and this kind of encaustic was therefore styled "ship-painting."

About the year 1749 Count Caylus and J. J. Bachelier, a painter, made some experiments in encaustic painting, and the count undertook to explain an obscure passage in Pliny, supposed to be the following (xxxv. 30):—"Ceris pingère ac picturam inure prius quisim ex coccigvertur non constat. Quod Aristidis inventum putant, postea consummatur a Praxitele; sed aliquanto vetustiores encausticae picturae existere, ut Polygnotus et Nicanor et Arcesiai Pariorum. Lysippus quoque Aeginae picture saeua inscriptis evhæavev, quod profecto non fecissent nisi encaustica inventa." There are other passages in Pliny bearing upon this subject, in one of which (xxi. 49) he gives an account of the preparation of "Punica cera."

The nature of this Punic wax, which was the essential ingredient of the ancient painting in encaustic, has not been definitely ascertained. The chevalier Lorgna, who investigated the subject in a small but valuable tract, asserts that the nitron which Pliny mentions is not the nitre of the moderns, but the natron of the ancients, viz. the native salt which is found crystallized in Egypt and other hot countries in sand, and is a solution of salt water. This substance the Carthaginians, according to Pliny, used in preparing their wax, and hence the name Punica seems to be derived. Lorgna made a number of experiments with this salt, using from three to twenty parts of white melted wax with one of natron. He held the mixture in an iron vessel over a slow fire, stirring it gently with a wooden spatula, till the mass assumed the consistency of butter and the colour of milk. He then removed it from the fire, and put it in the shade in the open air to harden. The wax being cooled liquefied in water, and a milky emulsion resulted from it like that which could be made with the best Venetian soap.

Experiments, it is said, were made with this wax in painting in encaustic in the apartments of the Count Giovanni Battista Gasola by the Italian painter Antonio Paccheri, who dissolved the Punic wax when it was not so much hardened as to require to be "ignis resoluta," as expressed by Pliny, with pure water, slightly infused with gum-arabic, instead of sarcocolla, mentioned by Pliny. He afterwards mixed the colours with this wax so liquefied as he would have done with oil, and proceeded to paint in the same manner; nor were the colours seen to run or alter in the least; and the mixture was so flexible that the pencil ran smoother than it would have done with oil. The painting being dry, he treated it with caustic, and rubbed it with linen cloths, by which the colours acquired peculiar vivacity and brightness.

About the year 1755 further experiments were made by Count Caylus and several French artists. One method was to melt wax with oil of turpentine as a vehicle for the colours. It is well known that wax may be dissolved in spirit and used as a medium, but it dries too quickly to allow of perfect blending, and would by the evaporation of the spirit be prejudicial to the artist's health. Another method suggested about this time, and one which seems to tally very well with Pliny's description, is the following:—Melt the wax with a solution of salt of tartar, and let the colours be ground up in it. Place the picture when finished before the fire till degrees the wax melts, swells, and is blown up upon the picture; the picture is then gradually removed from the fire, and the colours, without being injuriously affected by the operation of the fire, become unalterable, spirits of wine having been burnt upon them without doing the least harm. Count Caylus's method was different, and much simpler: (1) the cloth or wood designed for the picture is waxed over, by rubbing it simply with a piece of beeswax; (2) the colours are mixed up with pure water; but as these colours will not adhere to the wax, the whole ground must be rubbed over with chalk or whitening before the colour is applied; and (3) when the picture is dry it is put near the fire, whereby the wax is melted and absorbs the colours. It must be allowed that nothing could well be simpler than this process, and it was thought that this kind of painting would be capable of withstanding the weather and of lasting longer than oil painting. This kind of painting has not the gloss of oil painting, so that the picture may be seen in any light, a quality of the very first importance in all methods of mural painting. The colours too, when so secured, are firm, and will bear washing, and have a property which is perhaps more important still, viz. that exposure to smoke and foul vapours merely leaves a deposit on the surface without injuring the work. The "encausto pingendi" of the ancients could not have been enamelling, as the word "inure," taken in its rigorous sense, might at first lead one to suppose, nor could it have been painting produced in the same manner as encaustic tiles or encaustic tesseræ; but that it must have been something akin to the count's process would appear from the words of Pliny already quoted, "Ceris pingère ac picturam inure."

Werner of Neustadt found the following process very effectual in making wax soluble in water. For each pound of white wax he took twenty-four ounces of potash, which he dissolved in two pints of water, warming it gently. In this ley he boiled the wax, cut into little bits, for half an hour, after which he removed it from the fire and allowed it to cool. The wax floated on the surface of the liquor in the form of a white saponaceous matter; and this being triturated with water produced a sort of emulsion, which he called wax milk, or encaustic wax. This preparation may be mixed with all kinds of colours, and consequently can be applied in a single operation.

Mrs Hooker of Rottingdean, at the end of the 18th century, made many experiments to establish a method of painting in wax, and received a gold palette from the Society of Arts for her investigations in this branch of art. Her account is printed in the tenth volume of the Society's Transactions (1792), under the name of Miss Emma Jane Greenwood.

Cave Thomas, Methods of Mural Decoration (London, 1869); Cros and Henry, L'Encaustique, &c. (1884); Donner von Richter, Uber Technisches in der Malerei der Alten (1890).

(1) ENCEINTE (Lat. in, within, cinctus, girdle; to be distinguished from the word meaning "pregnant," from in, not, and cinctus, i.e. with girdle loosened), a French term used technically in fortification for the inner ring of fortifications surrounding a town. Strictly the term was applied to the continuous line of bastions and curtains forming the "body of the place," this last expression being often used as synonymous with enceinte. The outworks, however, close to the enceinte were not considered as forming part of it. In modern fortification the enceinte is usually simply the innermost continuous line of fortifications. In architecture generally an enceinte is the close or precinct of a cathedral, abbey, castle, &c.

ENCINA, JUAN DEL (1469-1533), often called the founder of the Spanish drama, was born in 1469 near Salamanca probably at Encinas. On leaving the university of Salamanca he became a member of the household of the second duke of Alva. In 1492 the poet entertained his patron with a dramatic piece, the Triunfo de la jama, written to commemorate the fall of Granada. In 1496 he published his Cancionero, a collection of dramatic and lyrical poems. Some years afterwards he visited Rome, attracted the attention of Alexander VI. by his skill in music, and was appointed choirmaster. About 1518 Encina took orders, and made a pilgrimage to Jerusalem, where he said his first mass. Since 1509 he had held a lay canonry at Malaga; in 1519 he was appointed prior of Leon and is said to have died at Salamanca about 1533. His Cancionero is preceded by a prose treatise (Arte de trobar) on the condition of the poetic art in Spain. His fourteen dramatic pieces mark the transition from the purely ecclesiastical to the secular stage. The Au dei del Repolon and the Elogia de Fileno dramatize the adventures of shepherds; the latter, like Placido y Vitoriano, is strongly influenced by the Celestina. The intrinsic interest of Encina's plays is slight, but they are important from the historical point of view, for the lay pieces form a new departure, and the devout eclogues prepare the way for the arios of the 17th century. Moreover, Encina's
lyrical poems are remarkable for their intense sincerity and devout grace.

ENCE, JOHANN FRANZ (1791-1863). German astronomer, was born at Hamburg on the 23rd of September 1791. Matriculating at the university of Göttingen in 1811, he began by devoting himself to astronomy under Carl Friedrich Gauss; but he enlisted in the Hanseatic Legion for the campaign of 1813-14, and became lieutenant of artillery in the Prussian service in 1815. Having returned to Göttingen in 1816, he was at once appointed by Benhardt von Lindenau his assistant in the observatory of Seeburg near Gtha. There he completed his investigations of the comet of 1808, for which he was awarded the Cotta prize, in 1817; he correctly assigned a period of 71 years to the comet of 1812; and discovered the swift circulation of the remarkable comet which bears his name (see Comet). Eighty masterly treatises on its movements were published by him in the Berlin Abhandlungen (1829-1859). From a fresh discussion of the transits of Venus in 1761 and 1769 he deduced (1822-1824) a solar parallax of 8°.57, long accepted as authoritative.

In 1822 he became director of the Seeburg observatory, and in 1825 was promoted to a corresponding position at Berlin, where a new observatory, built under his superintendence, was inaugurated in 1835. He directed the preparation of the star-maps of the Berlin academy 1830-1859, edited from 1830 and greatly improved the Astronomisches Jahrbuch, and issued four volumes of the Astronomische Beobachtungen of the Berlin observatory (1840-1857).

Much labour was bestowed by him upon facilitating the computation of the movements of the asteroids. To this end he expended on the Berlin academy's account a great, mode of determination from an elliptic orbit from three observations, and became entitled to that body in 1831 a new method of calculating planetary perturbations by means of rectangular coordinates (reproduced in W. Ostwald's Klassiker der exacten Wissenschaften, No. 141, 1903).

Enccke visited England in 1840. Incipient brain-disease compelled him to withdraw from official life in November 1863, and he died at Spandau on the 26th of August 1865. He contributed extensively to the periodical literature of astronomy, and was twice, in 1823 and 1830, the recipient of the Royal Astronomical Society's gold medal.

ENCELAVE (a French word from enclaver, to enclose), a term signifying a country or, more commonly, an outlying portion of a country, entirely surrounded by the territories of a foreign or other power, such as the detached portions of Prussia, Saxony, &c., enclosed in the Thuringian States. From the point of view of the states whose detached portions of territory these become, they are called "Enclaves." "Enclose" is, however, generally used in a looser sense to describe a colony or other territory of a state, which, while possessing a seaboard, is entirely surrounded landward by the possession of some other power; or, if inland territory, nearly though not entirely so enclosed, e.g. the Lado Enclave in equatorial Africa.

ENCOIGNURE, in furniture, literally the angle, or return, formed by the junction of two walls. The word is now chiefly used to designate a small armoire, commode, cabinet or cupboard made to fit a corner; a chaise encoignure is called in English a three-cornered chair. In its origin the thing, like the word, is French, and the delightful Louis Quinze or Louis Seize encoignure in lacquer or in mahogany elaborately mounted in gilded bronze is not the least alluring piece of the great period of French furniture. It was made in a vast variety of forms so far as the front was concerned; in other respects it was strictly limited by its destination. As a rule these delicate and dainty receptacles were in pairs and placed in opposite angles; more often than not the top was formed of a slab of coloured marble.

ENCYCLICAL (from Late Lat. encyclicus, for encyclus = Gr. ἕκκυκλος, from ἐν and κύκλος, a "circle"), an ecclesiastical epistle intended for general circulation, now almost exclusively used of such letters issued by the pope. The forms encyclus and encyclic are sometimes, but more rarely, used. The old adjectival use of the word in the sense of "general" (encirling) is now obsolete, though it survives in the terms "encyclopedia."  

ENCYCLOPAEDIA. The Greeks seem to have understood by encyclopaedia (ἐγκυκλοπαίδεια, or ἐγκύκλιος παιδεία) instruction in the whole circle (ἐν κύκλῳ) or complete system of learning—education in arts and sciences. Thus Pliny, in the preface to his Natural History, says that his book treated of all the subjects of the encyclopaedia of the Greeks, "Jam omnia attingenda quae Graeci την ἐγκυκλοπαίδεια vocant." Quintilian (Inst. nat. 10) directs that before boys are placed over certain teachers they should be instructed in the other arts, "ut efficiatur oris ille doctrinae quam Graeci ἐγκυκλοπαίδεια vocant." Galen (De victus ratione in morbis acutis, c. 11) speaks of those who are not educated ἐν τῇ ἐγκυκλοπαίδειᾳ. In these passages of Pliny and Quintilian, however, from one or both of which the modern use of the word seems to have been taken, ἐγκύκλιος παιδεία is now read, and this seems to have been the usual expression. Vitruvius (lib. vi. præf.) calls the encyclides or ἐγκύκλιος παιδεία of the Greeks "doctrinarum omnium disciplina," instruction in all branches of learning. Strabo (lib. iv. cap. 10) speaks of philosophy καὶ τὴν ἐθνὴν παιδείαν ἐγκύκλιος. Tzetzes (Chiliades, xi. 537), quoting from Porphyry's Lives of the Philosophers, says that ἐγκύκλια μαθήματα was the circle of grammar, rhetoric, philosophy and the four arts under it, arithmetic, music, geometry and astronomy. Zonaras explains it as grammar, poetry, rhetoric, philosophy, mathematics and simply every art and science (astrologia, medicina, vérité et artis integrum), because sophists go through them as through a circle.

The idea seems to be a complete course of instruction in all parts of knowledge. An epic poem was called cyclic when it contained the whole mythology; and among physicians κύκλος ψευδείες, cyclo curare (Vegetius, De arte veterinaria, ii. 5, 6), meant a cure effected by a regular and prescribed course of diet and medicine (see Wower, De polymathia, c. 24, § 14).

The word encyclopaedia was probably first used in English by Sir Thomas Elyot. "In an oratory is required to be a heape of all maner of lerning: which of some is called the world of science, of other the circle of doctrine, which is in one worde of greke Encyclopedy" (The Governer, bk. i. chap. xili.). In his Latin dictionary, 1538, he explains "Encyclos et Encyclia, the cykle or course of all doctrines," and "Encyclopedia, that lerninge which comprehendeth all lyberall science and studies." The term does not seem to have been used as the title of a book by the ancients or in the middle ages. The edition of the works of Joachimus Fortius Kingebelgeres, printed at Basel in 1451, is called on the title-page Lucubrationes vel potius absolutissima kyplopaideia. Paulus Scalichus de Lika, an Hungarian count, wrote Encyclopediae seu orbis disciplinarum epistemon (Basileae, 1590, 400). Alsted published in 1608 Encyclopediad cursus philosophici, and afterwards expanded this into his great work, noticed below, calling it without any limitation Encyclopedia, because it treats of everything that can be learned by man in this life. This is now the most usual sense in which the word encyclopaedia is used—a book treating of all the various kinds of knowledge. The form "encyclopaedia" is not merely without any appearance of classical authority, but is etymologically less definite, complete and correct. For as Cyropaedia means "the instruction of Cyrus," so cyclopaedia may mean "instruction of a circle." Vossius says, "Cyclopaedia is sometimes found, but the best writers say encyclopaedia. (De vitis sermonis, 1645, p. 403). Gesner says, "cyclopaedes cyclicus, quae figura est simplicissima et perfectissima simul: nam inepti potes ubique in illa et ubique cohaeret. Cyclopaedia itaque significat omnem doctrinarum scientiam inter
se cohaerere; Encyclopaedia est institutio in illo circuito.” (Isagoge, 1774, l. 49).

In a more restricted sense, encyclopaedia means a system or classification of the various branches of knowledge, a subject on which many books have been published, especially in Germany, as Schmid’s Allgemeine Encyclopädie und Methodologie der Wissenschaften (Jena, 1810, 424, 147) pages. In this sense the Novum Organum of Bacon has often been called an encyclopaedia. But it is “a grammar only of the sciences: a cyclopaedia is not a grammar, but a dictionary; and to confuse the meanings of grammar and dictionary is to lose the benefit of a distinction which it is fortunate that terms have been coined to convey” (Quarterly Review, xxii. 354). Fortunius Lictor, an Italian universtv, entitled several of his dissertations on Roman altars and other antiquities encyclopaedias (as, for instance, Encyclopaedia ad Aram mysticam Nonarui, Pataviae, 1631, 410), because in composing them he borrowed the aid of all the sciences. The Encyclopaedia moralis of Marcellinus de Pise (Paris, 1845, 4 vols.) is a series of sermons. Encyclopaedia is often used to mean a book which is, or professes to be, a complete or very full collection or treatise relating to some particular subject, as Blane’s work, The Encyclopaedia of Rural Sports (London, 1852); The Encyclopaedia of Wit (London, 1853); The Vocal Encyclopaedia (London, 1857, 16mo), a collection of songs, catches, etc. The word is frequently used for an alphabetical dictionary treating fully of somescience or subject, as Murray, Encyclopaedia of Geography (London, 1834), Lefebvre Laboulaye, Encyclopédie technologique: Dictionnaire des arts et manufactures (Paris, 1845-1847). Whether under the name of “dictionary” or “encyclopaedia” large numbers of this class of reference-work have been published. These are essentially encyclopaedie, being subject books and not word-books. The important books of this character are referred to in the articles dealing with the respective subjects, but the following may be mentioned here: the Jewish Encyclopedia, in 12 vols. (1901), a descriptive record of the history, religion, literature and customs of the Jewish people from the earliest times; the Encyclopaedia of Sport, 2 vols. (1897-1898); Holtzendorff’s Encyclopädie der Rechtswissenschaft (1879; an edition in 2 vols., 1904); the Dictionary of Political Economy, edited by R. H. Inglis Paivgraves, 3 vols. (1894; reprinted 1903); the Encyclopædia Biblica, edited by T. K. Cheyne and J. Sutherland Black, 4 vols. (1899-1903); the Dictionary of the Bible, edited by James Hastings, 4 vols., with a supplementary volume (1904); an interesting series is the Répertoire général du commerce, dealing with the foreign trade of France, of which one part, the Encyclopaedia of Trade between the United States of America and France, with a preface by M. Gabriel Hanotaux, appeared, in French and English, in 1904.

The great Chinese encyclopaedias are referred to in the article on CHINESE LITERATURE. It will be sufficient to mention here the Wên hien t’ung Kao, compiled by Ma Twa-lin in the 14th century, the encyclopaedia ordered to be compiled by the Emperor Yung-loh in the 15th century, and the Ku K’in’tshu tshih ch’êng prepared for the Emperor Kang-hi (d. 1721), in 5000 volumes. A copy of this enormous work, bound in some 700 “volumes, is in the British Museum.

The most ancient encyclopaedia extant is Pliny’s Natural History in 39 books (including the preface) and 2493 chapters, which may be thus described generally:—book 1, preface; book 2, cosmogony, astronomy and meteorology; books 3 to 6, geography; books 7 to 11, zoology, including man, and the invention of the arts; books 12 to 19, botany; books 20 to 32, medicines, vegetable and animal remedies, medical authors and magic; books 33 to 37, metals, fine arts, mineralogy and mineral remedies. Pliny, who died a.d. 79, was not a naturalist, a physician or an artist, and collected his work in his leisure intervals while engaged in public affairs. He says it contains 20,000 facts (too small a number by half, says Lemaire), collected from 2000 books by 100 authors. Hardouin has given a list of 464 authors quoted by him. His work was a very high authority in the middle ages, and 43 editions of it were printed before 1536.

Martianus Minneus Felix Capella, an African, wrote (early in the 5th cent.), in verse and prose, a sort of encyclopaedia, which is important from having been regarded in the middle ages as a model storehouse of learning, and used in the schools, where the scholars had to learn the verses by heart, as a text-book of high-class education in the arts. It is sometimes entitled Satyra, or Satyricon, but is usually known as De nuptiis Philologiae et Mercurii, though this title is sometimes confined to the first two books, a rather confused allegory ending with the apotheosis of Philologia and the celebration of her marriage in the milky way, where Apollo presents to her the seven liberal arts, who, in the succeeding seven books, describe their respective branches of knowledge, namely, grammar, dialectics (divided into metaphysics and logic), rhetoric, geometry (geography, with some single geometrical propositions), arithmetic (chiefly the properties of numbers), astronomy and music (including poetry). The style is that of an African of the 5th century, full of grandiloquence, metaphors and strange words. He seldom mentions his authorities, and sometimes quotes authors whom he does not even seem to have read. His work was frequently copied in the Middle Ages by learned transcribers, and was 15 times printed from 1490 to 1590. The best annotated edition is by Kopp (Frankfort, 1836, 410), and the most convenient and the best text is that of Eysenhardt ( Lipsiae, 1866, 8vo).

Isidore, bishop of Seville from 600 to 630, wrote Etymologiarum libri XX. (often also entitled his Origins) at the request of his friend Braulio, bishop of Saragossa, who after Isidore’s death divided the work into books, as it was left unfinished, and divided only into titles.

The tenth book is an alphabet of 625 Latin words, not belonging to his other subjects, with their explanations as known to him, and often with their etymologies, frequently very absurd. The other books contain, as cont inued by his commentators: 1, the liberal arts; 2, rhetoric and dialectics; 3, the four mathematical disciplines—arithmetic, geometry, music and astronomy; 4, medicine; 5, laws and times (chronology), with a short chronic ending in 627; 6, ecclesiastical books and offices; 7, God, angels and the orders of the faithful; 8, the church and sects; 9, languages, society and relationships; 11, man and portents; 12, animals, in eight classes, namely, pecon et jumenta, beasts, small animals (including spiders, crickets, and ants), serpents, worms, fishes, birds and small winged creatures, chiefly insects; 13, the world and its parts; 14, the earth and its parts, containing chapters on Asia, Europe and Libya, that is, Africa; 15, buildings, fields and their measures; 16, stones (of various kinds); 17, minerals (chiefly metals); 18, war and games; 19, ships, buildings and garments; 20, provisions, domestic and rustic instruments.

Isidore appears to have known Hebrew and Greek, and to have been familiar with the Latin classical poets, but he is a mere collector, and his derivations given all through the work are not unfrequently absurd, and, unless when very obvious, will not bear criticism. He seldom mentions his authorities except when he quotes the poets or historians. Yet his work was a great one for the time, and for many centuries was a much valued authority and a rich source of material for other works; and he had a high reputation for learning both in his own time and in subsequent ages. His Etymologies were often imitated, quoted and copied. MSS. are very numerous: Antonio (whose editor, Bayer, saw nearly 40) says, “plures passimque reperiturum in bibliothecarii angulis.” This work was printed nine times between 1493 and 1495.

Hrabanus Maurus, whose family name was Magnentius, who educated in the abbey of Fulda, ordained deacon in 824 (“Annales Francorum” in Bouquet, Historiens de la France, v. 66), sent to the school of St. Martin of Tours, then directed by Alcuin, where he seems to have learned Greek, and is said by Trithemius to have been taught Hebrew, Syriac and Chaldean by Theophilus an Ephesian. In his Commentaries on Joshua (lib. ii. c. 5) he speaks of having resided at Sidon. He returned to Fulda and taught the school there. He became abbot of Fulda in 822, resigned in April 842, was ordained archbishop of Mainz on the 26th of July 847, and died on the 4th of February 856. He compiled an encyclopaedia De universo (also called in some MSS. De universalis natura, De natura rerum, and De origine rerum) in 22 books and 325 chapters. It is chiefly a rearrangement of

ENCYCLOPAEDIA

http://www.encyclopedia.com
Isidore's *Etymologies*, omitting the first four books, half of the fifth and the sixth (the seven liberal arts, law, medicine and the alphabet of words), and copying the rest, beginning with the seventh book, verbally, though with great omissions, and adding (according to Ritter, *Geschichte der Philosophie*, vii. 193, from Alcuin, Augustine or some other accessible source) the meanings given in the Bible to the subject matter of the chapter; while things not mentioned in Scripture, especially such as belong to classical antiquity, are omitted, so that his work seems to be formed of two alternating parts. His arrangement of beginning with God and the angels long prevailed in methodical encyclopaedias. His last six books follow very closely the order of the last five of Isidore, from which they are taken. His omissions are characteristic of the diminished literary activity and more contracted knowledge of his time. His work was presented to Louis the German, king of Bavaria, at Hersfeld in October 847, and was printed in 1473, fol., probably at Venice, and again at Strassburg by Mentelin about 1472–1475, fol., 334 pages.

Michael Constantine Psellus, the younger, wrote *Διάδοσις παράδοσις*, dedicated to the emperor Michael Ducas, who reigned 1071–1078. It was printed by Fabricius in his *Bibliotheca Graeca* (v. 11), vol. v., in 186 pages, 409 and 193 chapters, each containing a question and an answer. Begins with divinity: it goes on through natural history and astronomy, and ends with chapters on excessive hunger, and why flesh hung from a fig-tree becomes tender. As collation with a Turin MS. showed that 35 chapters were wanting, Harles has omitted the text in his edition of Fabricius, and gives only the titles of the chapters (v. 84–88).

The author of the most famous encyclopaedia of the middle ages was Vincent (q.v.) of Beauvais (c. 1190–1264), whose work *Bibliothea mundi sive Speculum majus*—divided, as we have it, into four parts, *Speculum naturale*, *Speculum doctrinale*, *Speculum morale* (this part should be ascribed to a later hand), and *Speculum historiale*—was the great compendium of mid-13th century knowledge. Vincent of Beauvais preserved several works of the middle ages and gives extracts from many lost classics and valuable readings of others, and did more than any other medieval writer to awaken a taste for classical literature. Fabricius (*Bill. Græcæ*, 1738, iv. pp. 107–115) has given a list of his works, his Hebrew and Arabic chapters, and his Latin chapter, *Speculum naturale*. To these should be added about 100 more for the *doctrinale* and *historiale*. As Vincent did not know Greek or Arabic, he used Latin translations. This work is dealt with separately in the article on VINCENT OF BEAUVAIS.

Brunetto Latini of Florence (born 1230, died 1294), the master of Dante and Guido Cavalcanti, while an exile in France between 1260 and 1267, wrote in French *Li Livres dou Tresor*, in 3 books and 413 chapters. Book i. contains the origin of the world, the history of the Bible and of the foundation of governments, astronomy, geography, and lastly natural history, taken from Aristotle, Pliny, and the old French Bestiaries. The first part of Book ii., on morality, is from the *Ethics* of Aristotle, which Brunetto had translated into Italian. The second part is little more than a copy of the well-known collection of extracts from ancient and modern moralists, called the *Moralitates of the Philosophers*, of which there are many MSS. in prose and verse. Book iii., on politics, begins with a treatise on rhetoric, chiefly from Cicero, De inventione, with many extracts from other writers, and Brunetto's own opinions. The last part, the most original and interesting of all, treats of the government of the Italian republics of the time. Like many of his contemporaries, Brunetto revised his work, so that there are two editions, the second made after his return from exile. MSS. are singularly numerous, and exist in all the dialects then used in France. Others were written in Italy. It was translated into Italian in the latter part of the 13th century by Bono Giamboni, and was printed at Treviso, 1474, fol., Venice, 1528 and 1533. The *Tesoro di Brunetto* must not be confounded with his *Tesoretto*, an Italian poem of 2937 short lines. Napoleon I. had intended to have the French text of the *Tesoro* printed with commentaries, and appointed a commission for the purpose. It was at last published in the *Collection des documents inédits* (Paris, 1863, 4to, 772 pages), edited by Chabaille from 42 MSS.

Bartholdi beguin of Glanville, an English Franciscan friar, wrote about 1360 a most popular work, *De proprietibus rerum*, in 19 books and 1350 chapters.

Book 1 relates to God; 2, angels; 3, the soul; 4, the substance of the body; 5, anatomy; 6, ages; 7, diseases; 8, the heavens (astrology and astronomy); 9, time; 10, matter and form; 11, air; 12, birds (including insects, 38 names, Aquila to Vesperitillo); 13, water (with fishes); 14, the earth (42 mountains, Ararat to Zîlî'; 15, provinces (171 countries, Asia to Zeugia); 16, precious stones (including coral, pearl, salt, 104 names, Arena to Zinguttes); 17, trees and herbs (197, Arbor to Zucarum); 18, animals (114, Aries to Vipes); 19, colours, scents, flavours and liquors, with a list of 36 eggs (Aspis to Vultur). Some editions add book 20, accidents of things, that is, numbers, measures, weights and sounds. The Paris edition of 1574 has a book on bees.

There were 15 editions before 1500. An English translation was completed 11th February 1538 by John Trevisa, and printed by Wynkyn de Worde, Westminster, 1495 fol.; London, 1533, fol.; and with considerable additions by Stephen Batman, a physician, London, 1582, fol. It was translated into French by Jehan Corbichon at the command of Charles V. of France, and printed 14 times from 1482 to 1556. A Dutch translation was printed in 1479, and again at Haarlem, 1485, fol.; and a Spanish translation by Padre Vincente de Burgos, Tholosa, 1494.

Pierre Bersuire (Barchorius), a Benedictine, prior of the abbey of St Eloi in Paris, where he died in 1362, wrote a kind of encyclopaedia, chiefly relating to divinity, in three parts:—

*Reductiorum morae super tolat Bibliam, 428 moralitates* in 34 books on the Bible from Genesis to Apocalypse; *Reductiorum morale de proprietibus rerum*, in 14 books and 958 chapters, a methodical encyclopaedia or system of nature on the plan of Bartholomew of Glanville, and chiefly taken from him (Bersorius places animals next after fishes in books 9 and 10, and adopts as natural classes: *volatilia*, *natastilia* and *gressibilia*; *Dictionarius*, an alphabetical dictionary of 3514 words used in the Bible with moral expositions, occupying in the last edition 1538folio pages.

The first part was printed 11 times from 1474 to 1515, and the third 4 times. The three parts were printed together as *Patri Berchorii opera omnia* (an incorrect title, for he wrote many histories), Moguntiae, 1609, fol., 3 vols., 2579 pages; *Coloniae Agrippinæ*, 1631, fol., 3 vols.; id. 1730–1731, fol., 6 vols., 2570 pages.

A very popular small encyclopaedia, *Margarita philosophica*, in 12 books, divided into 26 tractates and 573 chapters, was written by Georg Reisch, a German, prior of the Carthusians of Freiburg, and confessor of the emperor Maximilian I. Books 1–7 treat of the seven liberal arts; 8, 9, principles and origin of natural things; 10, 11, the soul, vegetative and intellectual; 12, moral philosophy. The first edition, Heidelberg, 1496, 410, was followed by 8 others to 1535. An Italian translation by the astronomer Giovanni Paolo Gallucci was published at Venice in 1594, 1138 small quarto pages, of which 343 consist of additional tracts appended by the translator.

Raphael Maffei, called Volaterranus, being a native of Volterra, where he was born in 1451 and died 3th January 1522, wrote *Commentarii Urbani* (Rome, 1506, fol., in 38 books), so called because written at Rome. This *encyclopaedia*, printed eight times up to 1603, is remarkable for the great importance given to geography, and also to biography, which are not included in previous encyclopaedias. Indeed, the book is formed of three nearly equal parts,—geography, 11 books; anthropology (biography), 11 books; and philology, 15 books. The books are not divided into short chapters in the ancient manner, like those of its predecessors. The edition of 1603 contains 814 folio pages. The first book consists of the table of contents and a classified index; books 2–12, biography; 13–23, lives of illustrious men, the popes occupying book 22, and the emperors book 23, 24–27, animals and plants; 28, metals, gems, stones, houses and other inanimate things; 34, sacred physicians (grammar and rhetoric); 35, de scientibus mathematicis,
ENCYCLOPAEDIA

arithmetic, geometry, optics, catoptrics, astronomy and astrology; 36-38, Aristotelica (on the works of Aristotle).

Giovan Valla, born about 1430 at Placentia, and therefore called Placentinus, died at Venice in 1499 while lecturing on the immortality of the soul. Aldus published his work, edited by his son Giovanni Pietro Valla, De expetenisis et fugiendi rebus, Venetius, 1501, fol. 2 vols.

It contains 49 books and 2119 chapters. Book 1 is introductory, on knowledge, philosophy and mathematics, considered generally (he divides everything to be sought or avoided into three kinds: those interconnected, and situated in the body and thirdly, external, coming from without); books 2-49, logic; 5-9, music; 10-15, geometry, including Euclid and mechanics—book 15 being in three long chapters—de spiritualibus, that is, psychic and physical laws, de harmonicis, de catoptrics, and de catoptrica (with the structure and use of the astrolabe): 20-23, physics (including metaphysics): 24-30, medicine: 31-34, grammar; 35-37, dialectics; 38, poetry; 39, 40, rhetoric; 41, moral philosophy; 42, ethics; 43, psychology; 44, theolosy; 45, metaphysics; 46, theolosy (as a part of philosophy); 47, theolosy and politics; 48, metaphysics and politics; 49, de rebus externis, on the good and evil of the body (and soul): 49, de rebus externis, as glory, grandeur, etc.

Antonio Zara, born 1574, made bishop of Petna in Istria 1600, finished on the 17th of January 1614 a work published as Anatomia ingeniorum et scientiarum, Venetius, 1615, 4to, 664 pages, in four sections and 54 membra. The first section, on the dignity and excellence of man, in 16 membri, considers him in all his bodily and mental aspects. The first membrum describes his structure and his soul, and the latter part contains the author's conception of himself, an account of his book to Ferdinand, archduke of Austria. Four membra treat of the discovery of character by chiroiomy, physiognomy, dreams and astrology. The second section treats of 16 sciences of the imagination—writing, magic, poetry, oratory, courtiership (aucturcas), theoretical and mystic arithmetic, geometry, architecture, optics, cosmography, astrology, practical medicine, war, government. The third section treats of 8 sciences of intellect—logic, physics, metaphysics, theoretical medicine, ethics, practical jurisprudence, judicature, theological theology. The fourth section treats of 12 sciences of memory—grammar, practical arithmetic, human history, sacred canons, practical theology, sacred history, and lastly the creation and the final catastrophe. The book, now very rare, is well arranged, with a copious index, and is full of curious learning.

Johann Heinrich Alsted, born 1588, died 1638, published Encyclopaedia septem libris distincta, Herbomaria NASSOVIORUM, 1630, fol., 2 vols., 2543 pages of very small type. It is in 35 books divided into 7 classes, preceded by 48 typographical tables of the whole, and followed by an index of 119 pages.

I. Praecognitam disciplinarum, 4 books, hekholgia, technologia, archeologia, didactica, that is, on intellectual habits and on the classification, origin and study of the arts. II. Philoology, 6 books, lexica, grammatica, rhetorica, poëtica, logica, philoologia, 6 vols., contains dictionaries explained in Latin of 1076 Hebrew, 87 Syriac, 1934 Arabic, 1923 Greek and 2092 Latin words, and also nomenclator technologiae, that is, a classified vocabulary of terms used in the arts and sciences, in Latin, Greek and Hebrew, filling 34 pages; book 10, poetry, contains a list of 61 Rotweil words. III. Theoretical philosophy, 10 books:—book 11, metaphysics: 12, pneumatics (on spirites): 13, physics: 14, arithmetic: 15, geometry: 16, algebra: 17, spherics and astronomic: 18, astronomy: 19, geography (with maps of the Old World, Eastern Mediterranean, and Palestine under the Old and New Testaments, and a plate of Noah's ark): 19, optics: 20, music. IV. Practical philosophy, 4 books:—21, ethics: 22, economics (on relationships): 23, politics, with florilegium politicum, 119 pages of extracts from historians, philosophs and orators: 24, scholastics (on education, with a florilegium of 25 pages). V. The three superior faculties:—25, theology: 26, law: 27, medicine: 28, with the Galenic and the Salernian school. VI. Mechanical arts in general:—book 29, mathematical mechanical arts; book 29, agriculture, gardening, care of animals, baking, brewing, preparing medicines, metallurgy (with 200 plates): 30, mechanics: 31, printing, dialling, etc. Under paediactica (games) is Vida's Latin poem on the health of children, accompanied by one on Leuschner on the luten Lorzius. VII. Farraginos disciplinarum, 5 books:—31, mnemonics: 32, history: 33, chronology: 34, architecture: 35, philolectica, miscellaneous arts, as magic, cabala, alchymy, magnetism, etc., with others apparently distinguished and named by himself, as, paradoxa, the art of explaining paradoxes; dipnosophica, the art of philosophizing while feasting; cyclogonomica, the art of conversing well de quovis sebilib: tabacology, the nature, use and abuse of tobacco, etc.—in all 35 articles in this book.

Alsted's encyclopaedia was received with very great applause, and was highly valued. Lami (Entretiens, 1684, p. 188) thought it almost the only encyclopaedia which did not deserve to be despised. Alsted's learning was very various, and his reading was very extensive and diversified. He gives few references, and Thomasius charges him with plagiarism, as he often copies literally without any acknowledgment. He wrote not long before the appearance of encyclopaedias in modern languages superseded his own and other Latin books, and but a short time before the alphabetical arrangement began to prevail over the methodical. His book was reprinted, Lugduni, 1649, fol. 4 vols., 2608 pages.

Jean de Magnon, historiographer to the king of France, undertook to write an encyclopaedia in French heroic verse, which was to fill ten volumes of 20,000 lines each, and to render libraries merely a useless ornament. But he did not live to finish it, as he was killed at night by robbers on the Font Neuf in Paris, in April 1639. The part he left was printed as La nouvelle universelle, Paris, 1663, fol., 348 pages, 10 books containing about 11,000 lines. They began with the nature of God, and end with the history of the fall of man. His verses, say Chaudon and Delandine, are perhaps the most nervous, incorrect, obscure and flat in French poetry; yet the author had been the friend of Molière, and had acted with him in comedy.

Louis Moréri (born on the 25th of March 1643 at Bargemont, in the diocese of Fréjus, died on the 10th of July 1680 at Paris) wrote a dictionary of history, genealogy and biography, Le Grand Dictionnaire historique, ou le mélange curieux de l'histoire sacrée et profane, Lyons, 1674, fol. He began a second edition on a larger scale, published at Lyons in 1681, in two volumes; the sixth edition was edited by Jean le Clerc, Amsterdam, 1691, fol. 4 vols.; the twentieth and last edition, Paris, 1759, fol. 10 vols. Moréri's dictionary, still very useful, was of great value and importance, although not the first of the kind. It superseded the very inferior compilation of Jujign-Brossière, Dictionnaire théologique, historique, politique, cosmographique, et chronologique, Paris, 1644, fol; Rouen, 1668, etc., 'a translation, with additions, of the Dictumnum et politicum, geographicum, et politicum of Charles Estienne, published in 1553, 4to and often afterwards. As such a work was much wanted, Jujign's book went through twelve editions in less than thirty years, notwithstanding its want of criticism, errors, anachronisms, defects and inferior style.

Johann Jacob Hofmann (born on the 11th of September 1655, died on the 10th of March 1706), son of a schoolmaster at Basel, which he is said never to have left, and where he was professor of Greek and History, wrote Lexicon universale historico-geographicomo-chronologico-poëtico-philhologicum, Basileae, 1677, fol. 2 vols., 1823 pages, a dictionary of history, biography, geography, genealogies of princely families, chronology, mythology and philology. At the end is Nomenclator Miophylastos, an index of names of places, people, etc., in many languages, carefully collected, and explained in Latin, filling 110 pages; with an index of subjects not forming separate articles, occupying 34 pages. In 1683 he published a continuation in 2 vols., fol., 2205 pages, containing besides additions to the subjects given before the history of the arts, plants, stones, metals, elements, stars, and especially of music and his art; arts, honours, laws, magic, music, rites and a vast number of other subjects. In 1698 he published a second edition, Lugduni Batavorum, fol. 4 vols., 3742 pages, incorporating the continuation with additions. From the great extent of his plan, many articles, especially in history, are superfluous and faulty.

Étienne Chauvin was born at Nismes on the 18th of April 1640. He fled to Rotterdam on the revocation of the edict of Nantes, and in 1668 supplied Bayle's place in his lectures on philosophy. In 1695 he was invited by the elector of Brandenburg to go as professor of philosophy to Berlin, where he became the representative of the Cartesian philosophy, and died on the
versale

It consists at his edition 228th placing Lebelonging of philosophicus Vincenzo half was which the author; of the dictionary, the Cartesian philosophy, and was very much used by Brucker and other earlier historians of philosophy. It is written in a very dry and scholastic style, and seldom names authorities. The great dictionary of French, begun by the French Academy on the 7th of February 1690, excluded all words especially belonging to science and the arts. But the success of the rival dictionary of Furetière, which, as its title-page, as well as that of the Essais published in 1684, conspicuously announced, professed to give “les termes de toutes les Sciences et des Arts,” induced Thomas Corneille, a member of the Academy, to compile Le Dictionnaire des arts et des sciences, which the Academy published with the first edition of their dictionary, Paris, 1694, fol., as a supplement in two volumes, containing 1756 pages. It was reprinted at Amsterdam, 1696, fol. 2 vols., and at Paris in 1720, and again in 1732, revised by Fontenelle. A long series of dictionaries of arts and sciences have followed Corneille in placing in their titles the arts before the sciences, which he probably did merely in order to differ from Furetière. Corneille professed to quote no author whom had he not consulted; to take plants from Dioscorides and Matthiolus, medicine from Ettmüller, chemistry from a MS. of Perrault, and architecture, painting and sculpture from Félibien; and to give an abridged history of animals, birds and fishes, and an account of all religious and military orders and their statutes, heresies and heresies, and dignities and charges ancient and modern.

Pierre Bayle (born on the 18th of November 1647, died on the 28th of December 1706) wrote a very important and valuable work, Dictionnaire historique et critique, Rotterdam, 1697, fol. 2 vols. His design was to make a dictionary of the errors and omissions of Moréri and other authors; but he was so much involved by the numerous editions and supplements of Moréri.”

A second edition with an additional volume appeared at Amsterdam in 1702, fol. 3 vols. The fourth edition, Rotterdam, 1720, fol. 4 vols., was much enlarged from his manuscripts, and was edited by Prosper Marchand. It contains 3132 pages besides tables, &c. The ninth edition was published at Basel, 1741, fol. 10 vols. It was translated into English from the second edition, London, 1709, fol. 4 vols., with some slight additions and corrections by the author; and again from the fifth edition of 1730 by Birch and Lockman, London, 1734–1740, fol. 5 vols. J. G. de Chauffré published Nouveau Dictionnaire historique, Amsterdam, 1750–1756, fol. 4 vols., as a supplement to Bayle. It chiefly consists of the articles added by the English translators with many corrections and additions, and about 500 new articles added by himself, and contains in all about 1400 articles. Prosper Marchand, editor of the fourth edition, left at his death on the 14th of January 1756 materials for a supplement. Great part of it consisted of mathematical and astronomical tables, as he intended his dictionary to serve as a small mathematical library. He was allowed by Sir Isaac Newton to print his treatise on acids. He gives a table of logarithms to seven figures of decimals (44 pages), and one of sines, tangents and secants (120 pages), a list of books filling two pages, and an index of the articles in both volumes under 26 heads, filling 50 pages. The longest lists are law (1700 articles), chryurgy, anatomy, geometry, fortification, botany and music. The mathematical and physical part is considered very able. He often mentions his authorities, and gives lists of books on particular subjects, as botany and chronology. His dictionary was long very popular. The fifth edition was published in 1736, fol. 2 vols. A supplement, including no new subjects, appeared in 1744, London, fol., 906 pages, 6 plates. It was intended to rival Ephraim Chambers’s work (see below), but, being considered a book-seller’s speculation, was not well received.

Johann Hübner, rector of the Johanneum in Hamburg, born on the 17th of March 1668, wrote prefaces to two dictionaries written in German, which bore his name, and were long popular.
The first was Reales Staats Zeitungs- und Conversations-Lexicon, Leipzig, 1704, 8vo; second edition, 1706, 947 pages; at the end a revised index of names and indexes of Latin and French words; fifth edition, 1711; fifteenth edition 1755, 1110 pages. The thirty-first edition was edited and enlarged by F. A. Rüder, and published by Brockhaus, Leipzig, 1824-1828, 8vo, 4 vols., 3088 pages. It was translated into Hungarian by Fejer, Pesten, 1816, 8vo, 5 vols., 2958 pages. The second, published as a supplement, was Curiosities and reales Natur-Kunst-Berg-Gewerb- und Handlungs-Lexicon, Leipzig, 1712, 8vo, 788 pages, frequently reprinted to 1792. The first relates to the political state of the world, as religion, orders, states, rivers, towns, castles, mountains, genealogy, war, ships; the second to nature, science, art and commerce. They were the work of many authors, of whom Paul Jacob Marpurg, a celebrated and voluminous writer on trade and commerce, born at Nuremberg on the 27th of June 1656, was an extensive contributor, and is the only one named by Hübner.

Johann Theodor Jablonski, who was born at Danzig on the 1st of December 1654, appointed secretary to the newly founded Prussian Academy in 1700, when he went to Berlin, where he died on the 28th of April 1731, published Allgemeines Lexicon der Künste und Wissenschaften, Leipzig, 1721, 4to, a short but excellent encyclopedia still valued in Germany. It does not include theology, history, geography, biography and genealogy. He not only names his authorities, but gives a list of their works. A new edition in 1748 was increased one-third to 1305 pages. An improved edition, Königsberg and Leipzig, 1767, 4to, 2 vols., 1852 pages, was edited by J. J. Schwabe, public teacher of philosophy at Leipzig.

Ephraim Chambers (c.v.) published his Cyclopaedia; or an Universal Dictionary of Art and Sciences, containing an Explanation of the Terms and an Account of the Things Signified thereby in the several Arts, Liberal and Mechanical, and the several Sciences, Human and Divine, London, 1728, fol. 2 vols. The dedication to the king is dated October 15, 1727. Chambers endeavoured to connect the scattered articles relating to each subject by a system of references, and to consider “the several matters, not only in themselves, but relatively, or as they respect each other; both to treat them as so many wholes and as so many parts of some greater whole.” Under each article he refers to the subject to which it belongs, and also to its subordinate parts; thus Copyhold has a reference to Tenure, of which it is a particular kind, and other references to Rolls, Custom, Manor, Fine, Charterland and Freehold. In his preface he gives an “analysis of the divisions of knowledge,” 47 in number, with classed lists of the articles belonging to each, intended to serve as table of contents and also as a rubric or directory indicating the order in which the articles should be read. But it does so very imperfectly, as the lists are curtained by many et caetera; thus 10 occur in a list of 119 articles under Anatomy, which has nearly 2200 articles in Rees’s index. It omits etymologies unless “they appeared of some significance”; he gives only one grammatical form of each word, unless “culpable ideas are arbitrarily attached to different forms, as precipitate, precipitant, precipitation, when each has an article; and he omits complex ideas generally known, and thus “gets free of a vast load of plebeian words.” His work, he says, is a collection, not the produce of one man’s wit, for that would go but a little way, but of the whole commonwealth of learning. “Nobody that fell in my way has been spared, antient or modern, foreign nor domestic, Christian or Jew nor heathen.” To the subjects given by Harris he adds theology, metaphysics, ethics, politics, logic, grammar, rhetoric and poetry, but excludes history, biography, genealogy, geography and chronology, except their technical parts. A second edition appeared in 1738, fol. 2 vols., 2466 pages, “re-touched and amended in a thousand places.” A few articles are added and some others enlarged, but he was prevented from doing more because “the booksellers were alarmed with a bill in parliament containing a clause to oblige the publishers of all improved editions of books to print their improvements separately.” The bill after passing the Commons was unexpectedly thrown out by the Lords; but fearing that it might be revived, the booksellers thought it best to retreat though more than twenty sheets had been printed. Five other editions were published in London, 1730 to 1751-1752, besides one in Dublin, 1742, all in 2 vols. fol. An Italian translation, Venice, 1748-1746, 4to, 9 vols., was the first complete Italian encyclopedia. When Chambers was in France in 1730 he rejected very favourable proposals to publish an edition there dedicated to Louis XV. His work was so productive, and carefully done, and long maintained its popularity. But it had many defects and omissions, as he was well aware; and at his death, on the 15th of May 1740, he had collected and arranged materials for seven new volumes. John Lewis Scott was employed by the booksellers to select such articles as were fit for the press and to supply others. He is said to have done this very efficiently until appointed sub-preceptor to the prince of Wales and Prince Edward. His task was entrusted to Dr (afterwards called Sir John) Hill, who performed it very hastily, and with characteristic carelessness and self-sufficiency, copying freely from his own writings. The Supplement was published in London, 1753, fol. 2 vols., 3307 pages and 12 plates. As Hill was a botanist, the botanical part, which had been very defective in the Cyclopaedia, was the best.

Abraham Rees (1743-1825), a famous Nonconformist minister, published a revised and enlarged edition, “with the supplement and modern improvements incorporated in one alphabet,” London, 1778-1788, fol. 2 vols., 3010 pages (but not paginated), 150 plates. It was published in 468 numbers at 6d. each. Rees says that he has added more than 4400 new articles. At the end he gives an index of articles, classed under 100 heads, numbering about 57,000 and filling 80 pages. The heads, with 39 cross references, are arranged alphabetically. Subsequently there were reprints.

One of the largest and most comprehensive encyclopedias was undertaken and in a great measure completed by Johann Heinrich Zedler, a bookseller of Leipzig, who was born at Breslau 7th January 1706, made a Prussian commerciarmuth in 1731, and died at Leipzig in 1760, Grosses vollständiges Universal Lexicon Aller Wissenschaften und Künste welche bisher durch menschlichen Verstand und Witz erfunden und verbessert worden, Halle and Leipzig, 1732-1750, fol. 64 vols., 64,300 pages; and Nöthige Supplemente, ib. 1751-1754, vols. i. to iv., A to Caq, 3016 pages. The columns, two in a page, are numbered, varying from 1356 in vol. li. to 2588 in vol. xlix. Each volume has a dedication, with a portrait. The first nine are the emperors, the kings of Prussia and Poland, the empress of Russia, and the kings of England, France, Poland, Denmark and Sweden. The dedications, of which two are in verse, and all are signed by Zedler, amount to 459 pages. The supplement has no dedications or portraits. The preface to the first volume of the work is by Johann Peter von Ludwieg, chancellor of the university of Halle (born 15th August 1695, died 6th September 1743). Nine editors were employed, whom Ludwieg compares to the nine muses. Each whole of each subject was entrusted to the same person, that all its parts might be uniformly treated. Carl Günther Ludovici (born at Leipzig 7th August 1707, public teacher of philosophy there from 1734, died 3rd July 1778) edited the work from vol. xix., beginning the letter M, and published in 1759, to the end, and also the supplement. The work was published by subscription. Johann Heinrich Wolf, an eminent merchant and shopkeeper in Leipzig, born there on the 20th of April 1690, came to Zedler’s assistance by advancing the funds for expenses and becoming answerable for the subscriptions, and spared no cost that the work might be complete. Zedler very truly says, in his preface to vol. xvii., that his Universal Lexicon was a work such as no time and no nation could show, and both in its plan and execution it is much more comprehensive and complete than any previous encyclopedia. Colleges, says Ludwieg, where all sciences are taught and studied, are on that account called universitites, and their teaching is called studium universale; but the Universal Lexicon contains not only what they teach in theology, jurisprudence, medicine,
philosophy, history, mathematics, &c., but also many other things belonging to courts, chanceries, hunting, forests, war and peace, and to artists, artisans, housekeepers and merchants not thought of in colleges. Its plan embraces not only history, geography and biography, but also genealogy, topography, and from vol. viii., published in 1738, lives of illustrious living persons. Zedler inquires why death alone should make a deserving man capable of having his services and worthy deeds made known to the world in print. The lives of the dead, he says, are to be found in books, but those of the living are not to be met with anywhere, and would often be more useful if known. In consequence of this preface, many lives and genealogies were sent to him for publication. Cross references generally give not only the article referred to, but also the volume and column, and, when necessary, such brief information as may distinguish the word referred to from others similar but of different meaning. Lists of authorities, often long, exact and valuable are frequently appended to the articles. This work, which is well and carefully compiled, and very trustworthy, is still a most valuable book of reference on many subjects, especially topography, genealogy and biography. The genealogies and family histories are excellent, and many particulars are given of the lives and works of various persons, who lived elsewhere.

A work on a new plan was published by Dennis de Coetlogon, a Frenchman naturalized in England, who styled himself "Knight of St. Lazare, M.D., and member of the Royal Academy of Angers"—An Universal History of Arts and Sciences, London, 1745, fol. 2 vols., 2529 pages, 33 plates and 161 articles arranged alphabetically. He "endeavours to render each treatise as complete as possible, avoiding above all things needless repetitions, and never puzzling the reader with the least reference." Theology is divided into several treatises; Philosophy into Ethics, Logick and Metaphysick, each under its letter; and Physick is subdivided into Anatomy, Botany, Geography, Geometry, &c. Military Art is divided into Army, Fortification, Gunny. The royal licence is dated 13th March 1740–1741, the dedication is to the duke of Gisors, the pages are numbered, there is an appendix of 35 pages of astronomical tables, and the two indexes, one to each volume, fill 69 pages, and contain about 9000 subjects. The type is large and the style diffuse, but the subject matter is sometimes curious. The author says that his work is "the only one of the kind, and that he wrote out with his own hand every line, even the index. But notwithstanding the novelty of his plan, his work does not seem ever to have been popular.

Gianfrancesco Paviti, born at Padua in 1689, died at Venice in 1764, secretary of the Academy of Sciences at Venice, who had published in 1744 a 4to volume containing a Dizionario universale, wrote Nuovo dizionario scientifico e curioso sacro-profano, Venezia, 1746–1751, fol. 10 vols., 7791 pages, 597 plates. It is a general encyclopaedia, including geography, but not history or biography. He gives frequent references to his authorities and much curious information. His preliminary discourse (80 pages) contains a history of the several sciences from mathematics to geography. The book was published by subscription, and at the end of the last volume is a Catalogo, Saggi e Associazioni, 254 in thirty-two little volumes, which are engraved on copper. In each volume they are placed together at the end, and are preceded by an explanatory index of subjects referring to the plates and to the articles they illustrate.

One of the greatest and most remarkable literary enterprises of the 18th century, the famous French Encyclopédie, originated in a French translation of Ephraim Chambers's Cyclopaedia, begun in 1743 and finished in 1745 by John Mills, an Englishman resident in France, assisted by Gottfried Sellius, a very learned native of Danzig, who, after being a professor at Halle and Göttingen, and residing in Holland, had settled in Paris. They applied to Lebreton, the king's printer, to publish the work, to fulfil the formalities required by French law, with which, as foreigners, they were not acquainted, and to solicit a royal privilege. This he obtained, but in his own name alone. Mills complained so loudly and bitterly of this deception that Lebreton had to acknowledge formally that the privilege belonged en voile propriété to John Mills. But, as he again took care not to acquaint Mills with the necessary legal formalities, this title soon became invalid. Mills then agreed to grant him part of his privilege, and in May 1745 the work was announced as Encyclopédie ou dictionnaire universel des arts et des sciences, folio, four volumes of 250 to 260 sheets each, with a fifth of at least 120 plates, and a vocabulary or list of articles in French, Latin, German, Italian and Spanish, with other lists for each language explained in French, so that foreigners might easily find any article wanted. It was to be published by subscription at 135 livres, but for large paper copies 300 livres, the first volume to be delivered in June 1746, and the two last at the end of 1748. The subscription list, which was considerable, closed on the 31st of December 1745. Mills demanded an account, which Lebreton, who had again omitted certain formalities, insultingly refused. Mills brought an action against him, but before it was decided Lebreton procured the revocation of the privilege as informal, and obtained another for himself dated the 21st of January 1746. His former action was never followed up, but it appears that this unscrupulous publisher ought to have made him acquainted, Mills was despoiled of the work he had both planned and executed, and had to return to England. Jean Paul de Gua de Malves, professor of philosophy in the college of France (born at Carcassonne in 1713, died on the 15th of June 1785), was then engaged as editor merely to correct errors and add new discoveries. But he proposed a thorough revision, and obtained the assistance of many learned men and artists, among whom Desessarts names Louis, Condillac, d'Alembert and Diderot. But the publishers did not think his reputation high enough to ensure success, withheld his confidence, and often opposed his plans as too expensive. Tired at last of disputes, and too easily offended, de Gua resigned the editorship. The publishers, who had already made heavy advances, offered it to Diderot, who was probably recommended to them by his very well received Dictionnaire universel de medicine, Paris, 1746–1748, fol. 6 vols., published by Briasson, David and Durand, with notes and additions by Julien Busson, doctor regent of the faculty of medicine of Paris. It was a translation, made with the assistance of Eidous and Toussaint, of the celebrated work of Dr Robert James, inventor of the fever powders, A Medicinal Dictionary, London, 1743–1745, fol. 3 vols., 3275 pages and 98 plates, comprising a history of drugs, with chemistry, botany and natural history so far as they relate to medicine, and with an historical preface of 99 pages (in the translation 136). The proposed work was to have been similar in character. De Gua's papers were handed over to Diderot in great confusion. He soon persuaded the publishers to undertake a far more original and comprehensive work. His friend d'Alembert undertook to edit the mathematics. Other subjects were allotted to 21 contributors, each of whom received the articles on this subject in Mills' translation to serve as a basis for his work. But they were in most cases so badly composed and translated, so full of errors and omissions, that they were not used. The contributions were to be finished in three months, but none was ready in time, except Music by Rousseau, which he admits was hastily and badly done. Diderot was imprisoned at Vincennes, on the 29th of July 1749, for his Lettre sur les aveugles. He was closely confined for 28 days, and was then for three months and ten days a prisoner on parole in the castle. This did not stop the printing, though it caused delay. The prospectus by Diderot appeared in November 1750. The work, was to form 8 vols. fol., with at least 600 plates. The first volume was published in July 1751, and delivered to the subscribers in August. The second appeared in January 1752. An arrêt of the council, 4th of February, suppressed both volumes as injurious to the king's authority and to religion. Maleherbes, director-general of the Librairie, stopped the issue of volume ii., 9th of February, and on the 21st went with a lettre de cachet to Lebreton's to seize the plates and the MSS., but did not find, says Barbier, even those of volume iii., as they had been taken to his own
house by Diderot and one of the publishers. The Jesuits tried to continue the work, but in vain. It was less easy, says Grimm, than to ruin philosophers. The *Dictionnaire de Trévoux* pronounced the completion of the *Encyclopædia* impossible, and the project ridiculous (3d edition, 1752, iii. 759). The government had to request the editors to resume the work as one honourable to the nation. The marquis d'Argenson writes, 7th of May 1752, that Mme de Pompadour had been urging them to proceed, and at the end of June he reports them as again at work. Volume iii., rather improved by the delay, appeared in October 1753; and volume vii., completing G, in November 1757. The clamours against the work soon recommenced. D'Alembert retired in January 1758, weary of sermons, satires and intolerant and absurd censures. The parliament of Paris, by an arrêt, 23rd of January 1750, stopped the sale and distribution of the *Encyclopædia*, Helvetius's *De L'Espirit*, and six other books; and by an arrêt, 6th February, ordered them all to be burnt, but referred the *Encyclopædia* for examination to a commission of nine. An arrêt du conseil, 7th of March, revoked the privilege of 1746, and stopped the printing. Volume viii. was then in the press. Malesherbes warned Diderot that he would not be permitted to sell the whole of it when Diderot could not make a selection, or find a place of safety at such a short notice. Malesherbes said, “Send them to me, they will not look for them there.” This, according to Mme de Vandel, Diderot's daughter, was done with perfect success. In the article Pardonner Diderot refers to these persecutions, and says, “In the space of some months we have seen our honour, fortune, liberty and life imperilled.” Malesherbes, Choiseul and Mme de Pompadour protected the work; Diderot obtained private permission to go on printing, but with a strict charge not to publish any part until the whole was finished. The Jesuits were condemned by the parlement of Paris in 1762, and by the king in November 1764. Volume i. of plates appeared in 1762, and volumes vii. to xvi., ten volumes of text, 9408 pages, completing the work, with the 4th volume of plates in 1765, when there were 4250 subscribers. The work circulated freely in the provinces and in foreign countries, and was secretly distributed in Paris and Versailles. The general assembly of the clergy, on the 20th of June 1765, approved articles in which it was condemned, and on the 27th of September adopted a mémoire to be presented to the king. They were forbidden to publish their acts which favoured the Jesuits, but Lebreton was required to give a list of his subscribers, and was put into the Bastille for eight days in 1766. A royal order was sent to the subscribers to deliver their copies to the lieutenant of police. Voltairé in 1774 relates that, at a petit souper of the king at Trianon, there was a debate on the question of gunpowder. Mme de Pompadour said she did not know how her rouge or her silk stockings were made. Le Duc de la Vallière regretted that the king had confiscated their encyclopædias, which could decide everything. The king said he had been told that the work was most dangerous, but as he wished to judge for himself, he sent for a copy. Three servants with difficulty brought in the 21 volumes. The company found everything they looked for, and the king allowed the confiscated copies to be returned. Mme de Pompadour died on the 15th of April 1764. Lebreton had charge of the printing at Paris, and Diderot and Brissassin had the rest. Lebreton, who had the largest printing office in Paris, employed 50 workmen in printing the last ten volumes. He had the articles set in type exactly as the authors sent them in, and when Diderot had corrected the last proof of each sheet, he and his foreman, hastily, secretly and by night, unknown to his partners in the work, cut out whatever seemed to them daring, or likely to give offence, mutilated most of the best articles without any regard to the consecutive of what was left, and burnt the manuscript as they proceeded. The printing of the work was nearly finished when Diderot, having to consult one of his great philosophical articles in the letter S, found it entirely mutilated. He was confounded, says Grimm, at discovering the atrocity of the printer; all the best articles were in the same confusion. This discovery put him into a state of frenzy and despair from rage and grief. His daughter never heard him speak coolly on the subject, and after twenty years it still made him angry. He believed that every one knew what was wanting in each article, but in fact the mutilation was not perceived by even the authors, and for many years was known to few persons. Diderot at first refused to correct the remaining proofs, or to do more than write the explanations of the plates. He required, according to Mme de Vandel, that a copy, now at St Petersburg with his library, should be printed with columns in which all was restored. The mutilations began as far back as the article Intendant. But how far, says Rosenkranz, this murderous, incredible and infamous operation was carried cannot now be exactly ascertained. Diderot's articles, not including those on arts and trades, were reprinted in Naigeon's edition (Paris, 1821, 8vo, 22 vols.). They fill 4132 pages, and number 11390, of which 601 were written for the last ten volumes. They are on very many subjects, but principally on grammar, history, morality, philosophy, literature and metaphysics. As a contributor, his special department of the work was philosophy, and arts and trades. He passed whole days in workshops, and began by examining a machine carefully, then he had it taken to pieces and put together again, observed it at work, and lastly worked it himself. He thus learned to make complicated machines as the stocking and cut velvet looms. He at first received 1200 livres a year as editor, but afterwards 2500 livres a volume, besides a final sum of 20,000 livres. Although after his engagement he did not suffer from poverty as he had done before, he was obliged to sell his library in order to provide for his daughter. De Jaucourt spared neither time, trouble nor expense in perfecting the work, for which he received nothing, and he employed several secretaries at it for ten years. To pay them he had to sell his house in Paris, which Lebreton bought with the profits derived from de Jaucourt's work. All the publishers made large fortunes; their expenses amounted to 1,158,000 livres and their profits to 2,162,000. D'Alembert's "Discours Preliminaire," 45 pages, written in 1750, prefixed to the first volume, and delivered before the French Academy on his reception on the 19th of December 1754, consists of a systematic arrangement of the various branches of knowledge, and an account of their progress since their revival. His system, chiefly based on Voltaire, from whom he derived the classes, under memory, reason and imagination. Arts and trades are placed under natural history, superstition and magic under science de Dieu, and orthography and heraldry under logic. The literary world is divided into three corresponding classes—bruits, philosophes and beaux esprits. As in Ephraim Chambers's *Cyclopædia*, history and biography were excluded, except incidentally; thus Aristotle's life is given in the article Aristotelisme. The science to which an article belongs is generally named at the beginning of it, references are given to other articles, and the authors' names are marked by initials, of which lists are given in the earlier volumes, but sometimes their names are subscribed in full. Articles by Diderot have no mark, and those inserted by him as editor have an asterisk prefixed. Among the contributors were Voltaire, Euler, Marmontel, Montesquieu, D'Anville, D'Holbach and Turgot, the leader of the new school of economists which made its first appearance in the pages of the *Encyclopædia*. Louis wrote the surgery, Daubenton natural history, Echardus heraldry and art, Toussaint jurisprudence, and Condamine articles on South America.

No encyclopædia perhaps has been of such political importance, or has enjoyed so considerable a civil and literary history of its century. It sought not only to give information, but to guide opinion. It was, as Rosenkranz says (Diderot, i. 157), theistic and heretical. It was opposed to the church, then all-powerful in France, and being opposed, it became dangerous. It was, as Descroterres says (Voltaire, v. 164), a war machine; as it progressed, its attacks on the church and the still more despotic government, as well as on Christianity itself, became bolder and more undisguised, and it was met by opposition and persecution unparalleled in the history of encyclopædias. Its execution is very unequal, and its articles of very different value. It was not constructed on a regular plan, or subjected to sufficient supervision; articles were sent in by the
The Encyclopædia Britannica, being edited by a society of gentlemen in Scotland, printed in Edinburgh for A. Bell and C. Macfarquhar, and sold by Colin Macfarquhar at his printing office in Nicolson Street, was completed in 1771 in 3 volumes 4to, containing 2670 pages, and 160 copperplates engraved by Andrew Bell. It was published in numbers, of which the two first were issued in December 1768, "price 6d. each, or 8d on a finer paper," and was to be completed in 100 weekly numbers. It was compiled, as the title-page says, on a new plan. The different sciences and arts were "divided into distinct treatises or systems," of which there were eight. The whole, the title-page says, is 8vo, 2 vols. about 1700 pages long. The longest are "Anatomy," 166 pages, and "Surgery," 238 pages. The various technical terms, &c., are explained as they occur in the order of the alphabet. Instead of dismembering the sciences, by attempting to treat them intelligibly under a multitude of technical terms, they have digested the principles of every science in the form of systems or distinct treatises, and explained the terms as they occur in the order of the alphabet, with references to the sciences to which they belong. This plan, as the compilers say, differs from that of all the previous dictionaries of arts and sciences. Its merit and novelty consist in the combination of De Coetlogon's plan with that in common use,—on the one hand keeping important subjects together, and on the other facilitating reference by numerous separate articles. It is doubtful to whom the credit of this plan is due. The editor, William Smellie, a printer (born in 1745, died on the 24th of June 1793), afterwards secretary and superintendent of natural history to the Society of Scottish Antiquaries, is said by his biographer to have compiled the plan and written or compiled all the chief articles; and he prints, but without date, part of a letter written and signed by Andrew Bell by which he was engaged in the work:—"Sir, As we are engaged in publishing a dictionary of the arts and sciences, and as you have informed us that there are fifteen capital sciences which you will undertake for and write up the subdivisions and detached parts of these conform to your plan, and likewise to prepare the whole work for the press, &c. &c., we hereby agree to allow you £200 for your trouble, &c. &c."

Prof. Macvey Napier says that Smellie "was more likely to have suggested that great improvement than any of his known coadjutors." Archibald Constable, who was interested in the work from 1788, and was afterwards intimately acquainted with Bell, says Colin Macfarquhar was the actual projector of the Encyclopædia, and the editor of the two first editions, while Smellie was employed to provide him with a contributory editor's hand." (Memoirs, ii. 311.) Dr Gleig, in his preface to the third edition, says that the book has been conceived by (Colin Macfarquhar) and his friend Mr Andrew Bell, engraver. By whom these gentlemen were assisted in digesting the plan which attracted to that work so much public attention, or whether they had any assistance, are questions in which our readers cannot be interested.

Macfarquhar, according to Constable, was a person of excellent taste and very general knowledge, though at starting he had little or no capital, and was obliged to associate Bell, then the principal engraver in Edinburgh, as a partner in his undertaking.

The second edition was begun in 1776, and was published in numbers, of which the first was issued on the 21st of June 1777, and the last, No. 181, on the 18th of September 1784, forming 10 vols. 4to, dated 1776 to 1783, and containing 8955 pages and 340 plates. The pagination is continuous, ending...
with page 9200, but 205 pages are inserted in various places, and page 7099 is followed by 8000. The number and length of the articles increased, 72 have cross headings, and more than 150 others may be classed as long articles. At the end is an appendix ("Abatements" to "Wood") of 300 pages, containing, under the heading Botanical Table, a list of the 931 genera included in the 58 natural orders of Linnaeus, followed by a list of 526 books, said to have been the principal authorities used. All the maps are placed together under the article "Geography" (105 pages). Most of the long articles have numbered marginal titles; "Scotland," 84 pages, has 837; "Medicine," 309 pages, and "Pharmacy" have each an index.

The plan of the work was enlarged by the addition of history and biography, which encyclopaedias in general had long omitted. "From the time of the second edition of this work, every encyclopaedia of note, in England and elsewhere, has been a cyclopaedia, not solely of arts and sciences, but of the whole wide circle of general learning and miscellaneous information" (Quarterly Review, xciil. 362). Smellie was applied to by Bell to edit the second edition, and to take a share of one-third in the work; but he refused, because the other persons concerned in it, at the suggestion of "a very distinguished nobleman of very high rank" (said by Professor Napier to have been the duke of Buccleuch), insisted upon the introduction of a system of general biography which he considered inconsistent with the character of a dictionary of arts and sciences. James Tytler, M.A., seems to have been selected as the next most eligible compiler. His father, a man of extensive knowledge, was 53 years minister of Fearn in Forfarshire, and died in 1785. Tytler (outlawed by the High Court of Justiciary, 7th of January 1793, buried at Salem in Massachusetts on the 11th of January 1804, aged fifty-eight) "wrote," says Watt, "many of the scientific treatises and histories, and almost all the minor articles" (Bibliotheca Brit.).

After about a year's preparation, the third edition was announced in 1787; the first number was published early in 1788, and the first volume in October 1788. There were to be 300 weekly numbers, price 1s. each, forming 30 parts at 1os. 6d. each, and 15 volumes, with 360 plates. It was completed in 1797 in 18 vols. 4to, containing 14,579 pages and 542 plates. Among the multifarious articles represented in the frontispiece, which was required by the traditional fashion of the period, is a balloon. The maps are, as in subsequent editions, distributed among the articles relating to the respective countries. It was edited by Colin Macfarquhar as far as the article "Mysteries" (by Dr. Doig, vol. xii.), when he died, on the 2nd of April 1793, in his forty-eighth year, "worn out," says Constable, "by fatigue and anxiety of mind." His children's trustees and Andrew Bell requested George Gleig of Stirclau (consecrated on the 36th of October 1808 assistant and successor to the bishop of Brechin), who had written about twelve articles, to edit the rest of the work; "and for the time, and for ever, allowed to Constable the reward of contributors, his part in the work was considered very well done" (Constable, ii. 312). Professor Robison was induced by Gleig to become a contributor. He first revised the article "Optics," and then wrote a series of articles on natural philosophy, which attracted great attention and were long highly esteemed by scientific men. The sub-editors were James Walker (Primus Scotiae Episcopus 27th of May 1837, died on the 5th of March 1841, aged seventy) until 1795, then James Thomson, succeeded in November 1796 by his brother Thomas, afterwards professor of chemistry at Glasgow, who remained connected with the Encyclopaedia until 1800. According to Kerr (Smellie's Life, i. 364–365), 10,000 copies were printed, and the profit to the proprietors was £4,200, besides the payments for their respective work in the conduct of the publication as tradesmen,—Bell as engraver of all the plates, and Macfarquhar as sole printer. According to Constable (Memoirs, ii. 312), the impression was begun at 2,000 copies, and concluded with a sale of 13,000. James Hunter, "an active bookseller of no character," who had a shop in Middle Row, Holborn, sold the book to the trade, and on his failure Thomson Bonar, a wine merchant, who had married Bell's daughter, became the seller of the book. He quarrelled with his father-in-law, who would not see him for ten years before his death in 1809. When the edition was completed, the copyright and remaining books were sold in order to wind up the concern, and "the whole was purchased by Bell, who gave £13 a copy, sold all the complete copies to the trade, printed up the odd volumes, and thus kept the work in the market for several years" (Constable, ii. 312).

The supplement of the third edition, printed for Thomson & Bell, and edited by Gleig, was published in 1801 in 2 vols. 4to, containing 1624 pages and 50 copperplates engraved by D. Lizards. In the dedication to the king, dated Stirling, 10th December 1800, Dr Gleig says: "The French Encyclopédie had been accused, and justly accused, of having disseminated far and wide the seeds of anarchy and atheism. If the Encyclopædia Britannica shall in any degree counteract the tendency of that pestiferous work, even these two volumes will not be wholly unworthy of your Majesty's attention." Professor Robison added 10 articles to the series he had begun when the third edition was so far advanced. Professor Playfair assisted in "Mathematics." Dr Thomas Thomson wrote "Chemistry." "Mineralogy" and other articles, in which the use of symbols was for the first time introduced into chemistry; and these articles formed the first outline of his System of Chemistry, published at Edinburgh in 1802, 8vo, 4 vols.; the sixth edition, 1821.

The fourth edition, printed for Andrew Bell, was begun in 1800 or 1801, and finished in 1810 in 20 vols. 4to, containing 16,033 pages, with 581 plates engraved by Bell. The dedication to the king, signed Andrew Bell, is dated Lauriston, Edinburgh, 1800. The preface is that of the third edition with the necessary alterations and additions in the latter part. No articles were reprinted from the supplement, as Bell had not the copyright. Wallace's articles on mathematics were much valued, and raised the scientific character of the work. Dr Thomas Thomson declined the editorship, and recommended Dr James Milar, afterwards editor of the Encyclopaedia Edinensis (died on the 13th of July 1827). He was fond of natural history and a good chemist, but, according to Constable, slow and dilatory and not well qualified. Andrew Bell died on the 10th of June 1803, aged eighty-three, "leaving," says Constable, "two sets of trustees; one literary to make the money, the other legal to lay it out after it was made." The edition began with 1250 copies and concluded at 4000, of which two-thirds passed through the hands of Constable's firm. Early in 1804 Andrew Bell had offered Constable and his partner Hunter the copyright of the work, printing materials, &c., and all that was then printed of the fourth edition, for £20,000. This offer was in agitation in March 1804, when the two partners were in London. On the 5th of May 1804, after Lord Jeffrey's arrival in Edinburgh, as he declares, "in the name of Francis Hornby, they entrusted him with a design, on which he found that most of his friends had harbored with great eagerness, 'for publishing an entire new encyclopaedia upon an improved plan.' Stewart, I understand, is to lend his name, and to write the preliminary discourse, besides other articles. Playfair is to superintend the mathematical department, and Robison the natural philosophy. Thomas Thomson is extremely zealous in the cause. W. Scott has embraced it with great affection. . . . The authors are to be paid at least as well as reviewers, and are to retain the copyright of their articles for separate publication if they think proper" (Cockburn, Life of Lord Jeffrey, 1852, ii. 90). It was then, perhaps, that Constable gave £100 to Bonar for the copyright of the supplement.

The fifth edition was begun immediately after the fourth as a mere reprint. "The management of the edition, or rather mismanagement, went on under the lawyer trustees for several years, and at last the whole property was again brought to the market by public sale. There were about 1800 copies printed of the five first volumes, which formed one lot, the copyright formed another lot, and so on. The whole was purchased by myself and in my name for between £13,000 and £14,000, and it was said by the wise
booksellers of Edinburgh and others that I had completely ruined myself and all connected with me by a purchase to such an enormous amount; this was early in 1722" (Constable, iii. 314). Bonar, who lived next door to the printing office, thought he could conduct the book, and had resolved on the purchase on the third day after the news of deals of the committee, for which the committee had voted £5,000, to the amount of £11,000, of which they received first, Constable adding £500, as the book had been so extremely successful. It was published in 20 vols., 1,017 pages, £25, price £36, and dated 18 vols. in 1727.

Some time after, Constable began to prepare for the publication of a supplement, to be of four or five, at the very utmost, five volumes. The first article arranged for was on "Chemistry" by Sir Humphry Davy, but he went abroad in October of 1725 and released him from his engagement, and Mr Brande, the second article was Mr Stewart's Dissertation, for which I agreed to pay him £1,000, leaving the extent of it to himself, but with this understanding, that it was to be under my own superintendence, and that all the pay was advanced to £1,000, of which they received first, Constable adding £500, as the book had been so extremely successful. It was published in 20 vols., 1,017 pages, £25, price £36, and dated 18 vols. in 1727.

The second edition of the Encyclopædia, issued in 1725, was a success. It was published in 20 vols., 1,017 pages, £25, price £36, and dated 18 vols. in 1727.

The sixth edition, revised, corrected, and improved, appeared in half-volume parts, price 16s., in boards, vol. xx. part ii., containing the work in May 1825. Constable, thinking it wise to reissue the whole of his 120 vols., and advanced £30,000 to subscribers for a subscription of £50, but a short time afterwards I felt that to pay one eminent individual £1,000 because he was a worthy Professor that I had fixed his payment at £50.

Constable, thinking it wise to reissue the whole of his 120 vols., and advanced £30,000 to subscribers for a subscription of £50, but a short time afterwards I felt that to pay one eminent individual £1,000 because he was a worthy Professor that I had fixed his payment at £50.

The sixth edition, revised, corrected, and improved, appeared in half-volume parts, price 16s., in boards, vol. xx. part ii., containing the work in May 1825. Constable, thinking it wise to reissue the whole of his 120 vols., and advanced £30,000 to subscribers for a subscription of £50, but a short time afterwards I felt that to pay one eminent individual £1,000 because he was a worthy Professor that I had fixed his payment at £50.

The eighth edition, 1853-1860, 410, 21 vols. (and Index of 239 pages, 1861), containing 17,957 pages and 402 plates, with many woodcuts, was edited by Dr Thomas Stewart Traill, professor of mathematics at the University of Edinburgh, and was in part a new arrangement. The dissertations were reprinted, with one on the "Rise, Progress and Corruptions of Christianity" (97 pages), by Archbishop Whately, and a conclusion of Leslie's to 1850, by Professor James David Forbes, 198 pages. The paper was of nearly three years, called by himself by "magnum opus" (Life, pp. 361, 366). Lord Macaulay, Charles Kingsley, Isaac Taylor, Hopworth Dixon, Robert Chambers, Rev. Charles Merivale, Rev. W. Farrar, Sir John Richardson, Dr Sorley, Dr Hooker, Henry Austin Layard, Edward B. Barton, John Crawford, Augustus Petermann, Baron Bunsen, Sir John Herschel, Dr Lankester, Professors Owen, Rankine, William Thomson, Ayton, Blackie, Daniel Wilson and Jukes, were some of the contributors, and their work was in large part written with the aid of over a million amount of the valuable material in the eighth, but was a substantially a new work; and it was undertaken to stand in the forefront of the scholarship of its time. Its contributors included the most distinguished men of letters and of science. In 1875, the work was reprinted, sold at about half the original price, and on the plan of payment by instalments, was issued by The Times of London; and in 1892, under the joint editorship of Sir Donald MacKenzie Wallace, President Arthur T. Hadley of Yale University, and Hugh Chisholm, a general editor, was published in 19 vols., the 9th edition of 1889, and the general editorship of Hugh Chisholm, with W. Allan Phillips as chief assistant-editor, and a staff of editorial assistants, the whole work of organizing and editing was conducted up to December 1900 from The Times offices. The tenth edition, of 1898, was completed by the 1144 authority, control of the Encyclopædia Britannica passed to Cambridge University, for the publication at the University Press in 1910-1911 of the 29 volumes (one being Index) of the 11th edition, a distinctive feature of this issue being the appearance of the whole series of volumes practically at the time.

A new and enlarged edition of the Encyclopædia arranged as a system of separate dictionaries, and entitled Encyclopædia méthodique ou par ordre de matières, was undertaken by Charles Joseph Panckoucke, a publisher of Paris (born at Lille on the 26th of November 1736, died on the 10th of December 1808). His privilege was dated the 20th of June 1780. The articles belonging to different subjects would readily form distinct dictionaries, although, having been constructed for an alphabetical plan, they seemed unsuited for any system wholly methodical. Two copies of the book and its supplement were cut from the whole, and the first were arranged into a separate dictionary. The division adopted was: 1. mathematics; 2. physics; 3. medicine; 4. anatomy and physiology; 5. surgery; 6. chemistry, metallurgy and pharmacy; 7. agriculture; 8. natural history of animals, in six parts; 9. botany; 10. minerals; 11. physical geography; 12. ancient and modern geography; 13. antiquities; 14. history; 15. theology; 16. philosophy; 17. metaphysics, logic and morality; 18. grammar and literature; 19. law; 20. finance; 21. political economy; 22. commerce; 23. marine; 24. art militaire; 25. beaux arts; 26. arts et métiers—all forming distinct dictionaries entrusted to different editors. The first object of each editor was to exclude all articles belonging to other subjects, and to take care that those of a doubtful nature should not be omitted by all. In some words (such as air, which belonged equally to chemistry, physics and medicine) the methodical arrangement has the unexpected effect of breaking up the single article into several widely separated. Each dictionary was to have an introduction and a classified table of the principal articles. History and its minor parts, as inscriptions, fables, medals, were to be included. Theology, which was neither complete, exact nor orthodox, was to be by the abbé Bergier, professor to Monsieur. The whole work was to be completed and connected together by a Vocabulaire Universel, 7 vol. 410, with references to all the places where each word occurred, and a very exact history of the Encyclopædia and its editions by Panckoucke. The prospectus, issued early in 1782, proposed three editions—84 vols. 8vo, 43 vols. 4to with 3 columns to a page, and 53 vols. 4to of about 100 sheets with 2 columns to a page, each edition having 7 vols. 4to of 250 to 300 pages each. The subscription was to be 672 livres from the 15th of March to July 1782, then 751, and 888 after April 1783. It was to be issued in livraisons of 2 vols. each, the first (jurisprudence, vol. i., literature, vol. 1.) to appear in July 1782, and the whole to be finished in 1787. The number of subscribers, 4072, was so great that the subscription list of 672 livres was closed on the 30th of April. Twenty-five printing offices were employed, and in November the first edition of the Vocabulaire Universel (jurisprudence, vol. 1.), and half vol. each of arts et métiers and arts physiques issued. A Spanish prospectus was sent out, and obtained 330 Spanish subscribers, with the inquisitor-general at their head. The complaints of the subscribers and his own heavy advances, over 150,000 livres, induced Panckoucke, in November 1788, to appeal to the authors to finish the work. Those en retard made new contracts, giving their word of honour to put their parts to press in 1788, and to continue them without interruption, so that Panckoucke hoped to finish the whole, including the vocabulary (4 or 5 vols.), in 1792. Whole sciences, as architecture, engineering, hunting, police, games, &c., had been overlooked in the prospectus; a new division was made in 44 parts, to contain 51 dictionaries and about 124 vols. Permission was obtained on the 27th of February 1790, to receive subscriptions for the separate dictionaries. Two thousand subscribers were lost by the Revolution. The 50th livraison appeared on the 23rd of July 1792, when all the dictionaries eventually published had been begun except seven—jeux familiers and mathématiques, physics, physical geography, chasses and pêches, and 16 were finished—mathematics, games, surgery, ancient and modern geography, history, theology, logic, grammar, jurisprudence, finance, political economy, commerce, marine, arts militaires, arts académiques, arts et métiers, encyclopédiana. Supplements were added to military art in 1797, and to history in 1807, but not to any of the other 16, though required for more than a year before 1832. The publication was continued by Henri Agasse, Panckoucke's son-in-law, from 1794 to 1813, and then by Mme Agasse, his widow, in 1832, when it was completed in 102 livraisons or 337 parts, forming 1665 vols. of text, and 51 parts containing 6439 plates. The letterpress issued with the plates amounts to 5458 pages, making with the text 124,210 pages. To save expense the plates belonging to architecture were not published. Pharmacy (separated from chemistry), minerals, education, pouts et chaussees were had been announced but were not published, neither was the Vocabulaire Universel, the key and index to the whole work, so that it is difficult to carry out any research on any subject. The original parts have been so often subdivided, and have been so added to by other dictionaries, supplements and appendices, that, without going into great detail, an exact account cannot be given of the work, which contains 88 alphabets, with 83 indexes, and 166 introductions, discourses, prefaces, &c. Many dictionaries have a classified index of articles; that of economic politics is very excellent, giving the contents of each article, so that any passage can be found easily. The largest dictionaries are medicine, 13 vols., 10,330 pages; zoology, 7 dictionaries, 13,645 pages, 1206 plates; botany, 12,002 pages, 1000 plates (34 only of cryptogamic plants); geography, 3 dictionaries and 2 atlases, 9900 pages, 139 maps and plates; jurisprudence (with police and municipalities), 10 vols., 7607 pages. Anatomy,
ENCYCLOPAEDIA

4 vols., 2866 pages, is not a dictionary but a series of systematic treatises. Assemble Nationale was to be in three parts,—(1) the history of the Revolution; (2) debates; and (3) laws and decrees. Only vol. ii., debates, appeared, 1792, 804 pages. Absens to Aurillac. Ten volumes of a Spanish translation with a vol. of plates were published at Madrid to 1806—viz. historia natural, i.; grammatica, i.; arte militar, i., ii.; geografia, i.—iii.; fabriscas, i., ii., plates, vol. i. A French edition was printed at Pauz, with the plates, says Peignot, very carefully engraved.

Probably no more unmanageable body of dictionaries has ever been published except Migne's Encyclopédie théologique, Paris, 1847-1857, 4to, 168 vols., 101 dictionaries, 110,050 pages.

No work of reference has been more useful or successful, or more frequently copied, imitated and translated, than that known as the Conversations Lexikon of Brockhaus. It was begun as Conversations Lexikon mit vonstehender Rücksicht auf die gegenwärtigen Zeiten, Leipzig, 1796 to 1808, 8vo, 6 vols., 2762 pages, by Dr Gottschel Renatus Löbel (born on the 1st of April 1797 at Thalwitz near Wurzen in Saxony, died on the 14th of February 1799), who intended to supersede Hübn, and included geography, history, and in part biography, besides mythology, philosophy, natural history, &c. Vols. i.—iv. (A to R) appeared 1796 to 1800, vol. v. in 1806. Friedrich Arnold Brockhaus (q.v.) bought the work with its copyright on the 25th of October 1808, for 1800 thalers from the printer, who seems to have got it in payment of his bill. The editor, Christian Wilhelm Franke, by contract dated the 16th of November, was to finish vol. vi. by the 4th of December, and the already projected supplement, 2 vols., by Michaelmas 1809, for 8 thalers a printed sheet. No penalty was specified, but, says his grandson, Brockhaus was to learn that such contracts, whether under penalty or not, are not kept, for the supplement was finished only in 1811. Brockhaus issued a new impression as Conversations Lexikon oder kurzgefasster Handwörterbuch, 8vo, 1809–1811, and on removing to Altenburg in 1811 began himself to edit the 2nd edition (1812–1819, 10 vols.), and, when vol. iv. was published, the 3rd (1814–1816). He carried on both editions together until 1817, when he removed to Leipzig, and began the 4th edition as Allgemeine deutsche Real-encyclopädie für die gehobten Stände. Conversations Lexikon. This title was, in the 14th edition, changed to that of Brockhaus's Konversations Lexikon. The 5th edition was at once begun, and was finished in eighteen months. Dr Ludwig Hain assisted in editing the 4th and 5th editions until he left Leipzig in April 1820, when Professor F. C. Hasse took his place. The 12,000 copies of the 5th edition being exhausted while vol. x. was at press, a 2nd unaltered impression of 10,000 was required in 1820 and a 3rd of 10,000 in 1822. The 6th edition, 10 vols., was begun in September 1822. Brockhaus died in 1823, and his two eldest sons, Friedrich and Heinrich, who carried on the business for the heirs and became sole possessors in 1829, finished the edition with Hasse's assistance in September 1823. The 7th edition (1827–1829, 12 vols., 10,489 pages, 13,000 copies, 2nd impression 14,000) was edited by Hasse. The 8th edition (1825–1836, 12 vols., 16,668 pages, 37,000 copies to 1842), begun in the autumn of 1832, ended May 1837, was edited by Dr Karl August Espe (born in March 1792, when Dr Gustav Stockmann joined, who was alone from April until joined by Dr Karl Wippermann in October. Besides the Universal Register of 136 pages and about 50,000 articles, each volume has an index. The supplement, 2 vols., 1843, was begun in February 1837, and finished in April 1839. The 12th edition, begun in 1875, was completed in 1879 in 15 vols., the 13th edition (1882–1887), in 16 vols., and the 14th (1901–1903) in 16 vols. with a supplementary volume in 1904. The Conversations Lexikon is intended, not for scientific use, but to promote general mental improvement by giving the results of research and discovery in a readable and popular form, without extended details. The articles, often too brief, are very excellent and trustworthy, especially on German subjects, give references to the best books, and include biographies of living men.

One of the best German encyclopedias is that of Meyer, Neues Konversations-Lexikon. The first edition, in 37 vols., was published in 1839–1852. The later editions, following closely the arrangement of Brockhaus, are the 4th (1855–1890, 17 vols.), the 5th (1894–1898, 18 vols.), and the 6th (begun in 1902).

The most copious German encyclopedia is Ersch and Gruber's Allgemeine Universalgeschichte, which was first published at Danzig in 1826. It was intended to be a comprehensive and complete history of the human race, embracing all branches of knowledge. The work was stopped by the war of 1816, when Professor Hufeland (born at Danzig on the 9th of October 1762) joined, but he died on the 25th of November 1817 while the specimen part was at press. The editors of the different sections at various times have been some of the best-known men of learning in Germany, including J. G. Gruber, M. H. E. Meier, Hermann Brockhaus, W. Müller, and Z. Hoffmann of Jena.

The Encyclopædia Metropolitana (London, 1845, 4to, 28 vols., issued in 59 parts in 1817–1845, 22,346 pages, 556 plates) professed to give sciences and systematic arts entirely and in their natural sequence, as shown in the introductory treatise on method by S. T. Coleridge. "The plan was the proposal of the poet Coleridge, and it had at least enough of a poetical character to be eminently unpractical" (Quarterly Review, xxiii., 379). However defective the plan, the excellence of many of the treatises by Archbishop Whately, Sir John Herschel, Professors Barlow, Peacock, de Morgan, &c., is undoubted. It is in four divisions, the last only being alphabetical:—I. Pure Sciences, 2 vols., 1813 pages, 16 plates, 28 treatises, includes grammar, law and theology; II. Mixed and Applied Sciences, 8 vols., 1350 pages, 437 plates, 42 treatises, including fine arts, useful arts, natural history, and its application; the medical sciences; III. History and Biography, 5 vols., 4438 pages, 7 maps, containing biography (155 essays) chronologically arranged (to Thomas Aquinas in vol. 3), and interspersed with (210) chapters on history (to 1815), as the most philosophical, interesting and natural form (but modern lives were so many that the plan broke down, and a division of biography, to be in 2 vols., was announced but not published); IV. Miscellaneous, 12 vols., 10,338 pages, 105 plates, including geography, a dictionary of English (the first form of Richardson's) and descriptive natural history. The index, 364 pages, contains about 9000 articles. A re-issue in 38 vols. 4to, was announced in 1849. Of a second edition 42 vols. 8vo, 14,744 pages, belonging to divisions i. to iii., were published in 1849–1858.

The very excellent and useful English Cyclopaedia (London, 1854–1862, 410, 23 vols., 12,117 pages; supplements, 1860–1873, 4 vols., 288 pages), conducted by Charles Knight, based on the Penny Cyclopaedia (London, 1833–1846, 410, 29 vols., 15,625 pages), of which he had the copyright, is in four divisions all alphabetical, and is as useful as the corresponding volumes of the American Cyclopaedia:—1, geography; 2, natural history; 3, biography (with 703 lives of living persons); 4, arts and sciences. The synoptical index, 168 pages, has four columns on a page, one for each division, so that the order is alphabetical and yet the words are classed.

Chamber's Encyclopaedia (Edinburgh, W. & R. Chambers), 1860–1868, 8vo, 10 vols., 8283 pages, edited in part by the publishers, but under the charge of Dr Andrew Findlater as acting
ENDECOTT—ENDIVE

382

EDITOR "throughout, was founded on the 10th edition of Brockhaus. A revised edition appeared in 1874, 8320 pages. In the list of 126 revisers were J.H. Burton, Emmanuel Deutsch, Professor Goldstücker, &c. The index of matters not having special articles contained about 1500 headings. The articles were generally excellent, more especially on Jewish literature, folk-lore and practical science; but, as in Brockhaus, the scope of the work did not allow extended treatment. A further revision took place, and in 1888-1892 an entirely new edition was published, in 10 vols., still further new editions being issued in 1893 and in 1901.

An excellent brief compilation, the Harmworth Encyclopaedia (1905), was published in 40 fortnightly parts (seventeen each) in England, and as Nelson's Encyclopaedia (revised) in 12 vols. (1906) in America. It was originally prepared for Messrs Nelson of Edinburgh and for the Carmelite Press, London.

In the United States various encyclopaedias have been published, but without rivalling there the Encyclopedia Britannica, the 9th edition of which was extensively pirated. Several American Supplements were also issued. The New American Cyclopaedia, New York (Appleton & Co.), 1858-1863, 16 vols., 12,752 pages, was the work of the editors, George Ripley and Charles Anderson Dana, and 364 contributors, chiefly American. A supplementary work, the American Annual Cyclopaedia, a yearly 8vo vol. of about 800 pages and 250 articles, was started in 1861, but ceased in 1902. In a new edition, the American Cyclopaedia, 1873-1876, 8vo, 16 vols., 13,484 pages, by the same editors, 4 associate editors, 31 revisers and a librarian, each article passed through the hands of 6 or 8 revisers.

Other American encyclopaedias are Alvin J. Johnson's New Universal Cyclopaedia, 1875-1877, in 4 vols., a new edition of which (excellently planned) was published in 8 vols., 1893-1895, under the name of Johnson's Universal Cyclopaedia; the Encyclopaedia Americana, edited by Francis Lieber, which appeared in 1873-1874 in 14 vols.; a new work under the same title, published in 1903-1904 in 16 vols.; the International Cyclopaedia, first published in 1884 (revised in 1891, 1894 and 1898), and superseded in 1902 (revised, 1906) by the New International Cyclopaedia in 17 vols.

In Europe a great impetus was given to the compilation of encyclopaedias by the appearance of Brockhaus's Conversations-Lexicon (see above), which, as a begetter of these works, must rank, in the 19th century, with the Cyclopaedia of Ephraim Chambers in the 18th. The following, although in no sense an exhaustive list, may be mentioned:

In France: Le Grand Dictionnaire universel du XIXe siècle, of Pierre Larousse (15 vols., 1866-1876), with supplementary volumes in 1877, 1887 and 1890; the Nouveau Larousse illustré, dictionnaire universel encyclopédique (7 vols., 1901-1909), (this is in no wise a re-issue or an abridgment of Le Grand Dictionnaire of Pierre Larousse); La Grande Encyclopédie, inventaire raisonné des sciences, des lettres, et des arts, in 31 vols. (1886-1903). In Italy, the Nuova Enciclopedia Italiana (14 vols., 1841-1881), and in 25 vols. (1875-1888). In Spain, the Diccionario enciclopédico Hispano-Americano de literatura, ciencias y artes, published at Barcelona (25 vols., 1877-1899). The Russian encyclopaedia, Russkii Entsiklopedicheski Slovar (41 vols., 1905), 2 supplementary vols., 1908 was published under the supervision of the Russian Academy, but has become a monumental encyclopaedia, to which all the best Russian men of science and letters have contributed. Elaborate encyclopaedias have also appeared in the Polish, Hungarian and Scandinavian languages. Of special interest in the encyclopaedias there have been re-issues of the Nordisk Conversations-Lexicon, first published in 1838-1863, and of the Svenska Conversations-Lexicon, first published in 1845-1851.

ENDECOTT, JOHN (c. 1588-1665), English colonial governor in America, was born probably at Dorchester, Dorsetshire, England, about 1588. Little is known of him before 1628, when he was one of the six " joint adventurers " who purchased from the Plymouth Company a strip of land about 60 m. wide along the Massachusetts coast and extending westward to the Pacific Ocean. By his associates Endecott was entrusted with the responsibility of leading the first colonists to the region, and with some sixty persons proceeded to Naumkeag (later Salem) where Roger Conant, a seceder from the colony at Plymouth, had begun a settlement two years earlier. Endecott experienced some trouble with the previous settlers and with Thomas Morton’s settlement at “ Merry Mount “ (Mount Wollaston, now Quincy), where, in accordance with his strict Puritanical tenets, he cut down the maypole and dispersed the merry-makers. He was the local governor of the Massachusetts Bay Colony from the 30th of April 1629 to the 12th of June 1630, when John Winthrop, who had succeeded Matthew Cradock as governor of the company on the 20th of October 1629, brought the charter to Salem and became governor of the colony as well as of the company. In the years immediately following he continued to take a prominent part in the affairs of the colony, serving as an assistant and as a military commissioner, and commanding, although with little success, an expedition against the Pequots in 1636. At Salem he was a member of the congregation of Roger Williams, whom he resolutely defended in his trouble with the New England clerical hierarchy, and excited by Williams’ teachings, cut the cross of St George from the English flag in token of his hatred of all symbols of Romanism. He was deputy-governor in 1641-1644, and governor in 1644-1645, and served also as sergeant-major-general (commander-in-chief) of the militia and as one of the commissioners of the United Colonies of New England, of which he in 1648 he was president. On the death of John Winthrop in 1649 he became governor, and by annual re-elections served continuously until his death, with the exception of two years (1650-1651 and 1654-1655), when he was deputy-governor. Under his authority the colony of Massachusetts Bay made rapid progress, and except in the matter of religious intolerance—he showed great bigotry and harshness, particularly towards the Quakers—his rule was just and praiseworthy. Of him Edward Eggleston says: " A strange mixture of rascious, pious zeal, genial manners, hot temper, and harsh bigotry, his extravagances supply the condiment of humour to a very serious history—it is perhaps the principal debt posterity owes him." He died on the 13th of March 1665.

See C. M. Endicott, Memoirs of John Endicott (Salem, 1847), and a " Memoir of John Endicott " in Antiquarian Papers of the American Antiquarian Society (Worcester, Mass., 1879).

ENDIVE, Cichorium Endivia, an annual esculent plant of the natural order Compositae, commonly reputed to have been introduced into Europe from the East Indies, but, according to some authorities, more probably indigenous to Egypt. It has been cultivated in England for more than three hundred years, and is mentioned by John Gerarde in his Herbal (1597). There are numerous varieties of the endive, forming two groups, namely, the curled or narrow-leaved (var. crispa), and the Batavian or broad-leaved (var. latifolia), the leaves of which are not curled. The former varieties are those most used for salads, the latter being grown chiefly for culinary purposes. The plant requires a cool climate and does well in the climate of England sowing for the main crop should begin about the second or third week in June; but for plants required to be used young it may be as early as the latter half of April, and for winter crops up to the middle of August. The seed should be finely spread in drills 4 in. asunder, and then lightly covered; after reaching an inch in height the young plants are thinned; and when about a month old they may be placed out at distances of 12 or 15 in., in drills 3 in. in depth, care being taken in removing them from the seed-bed to disturb their roots as little as possible. The Batavian require more room than the curled-leaved varieties. Transplantation, where early crops are required, has been found inadvisable. Rapidity of growth is promoted by the application of liquid manures. The bleaching of endive, in order to prevent the development of the natural bitter taste of the leaves, and to improve their appearance, is begun about three months after the sowing, and is best effected either by tying the outer leaves around the inner, or, as in damp seasons, by the use of the
In France may be mentioned the commune of Batz, near Le Broisc in Loire-Inférieur, many of the central cantons of Bretagne, and the singular society called Fortatifines—supposed to be of Irish descent—living between St Arnaud and Bourges.

Many other European examples might be mentioned, such as the Marans of Auvergne, a race of Spanish converted Jews accused of introducing syphilis into France; the Burins and Sermoyens, chiefly cattle-breeders, scattered over the department of Ain and especially in the arrondissement of Bourg-en-Bresse; the Vaquéros, shepherds in the Asturias Mountains; and the Jewish Chuetas of Majorca.

See Gilbert Malcolm Sprout’s Scenes and Studies of Savage Life; Westmonkar’s History of Human Marriage (1884); Lord Avebury’s Origin of Civilisation (1902); J. F. McLennan’s Primitive Marriage (1885).

ENDOR, an ancient town of Palestine, chiefly memorable as the abode of the sorceress whom Saul consulted on the eve of the battle of Gilboa, in which he perished (1 Sam. xxviii. 5-25). According to a psalmist (Ps. lxxxi. 9) it was the scene of the rout of Jabin and Sisera. Although situated in the territory of the Issachar, it was assigned to Manasseh.

In the time of Eusebius and Jerome Endor existed as a large village 5 m. south of Mount Tabor; there still is a poor village of the same name on the slope of Jebel Dahài, near which are numerous caves. For a description of the locality see Stanley, Sinai and Palestine, P. 22.

ENDOSPORA, a natural group or class of the Sporozoa, consisting of the orders Myxosporida, Actinomyxidia, Sarcosporidia and Haplosporidia, together with various insufficiently-known forms (Sero- and Exosporidia), regarded at present as Sporozoa incertae sedis. The distinguishing feature of the group is that the spore-mother-cells (pansporoblasts) arise in the interior of the body of the parent-individual; in other words, sporulation is endogenous. Another very general character—though not so universal—is that the adult trophozoite possesses more than one nucleus, usually many (i.e. it is multinucleate). In the majority of forms, though apparently not in all (e.g. certain Microsporidia), sporulation goes on coincidently with growth and trophic life. With regard to the origin of the group, the probability is greatly in favour of a Rhizopod ancestry. The entire absence, at any known period, of a flagellate or even gregariniform phase; on the other hand, the amoeboid nature of the trophozoites in very many cases together with the formation of pseudopodia; and, lastly, the single spore-formation characteristic of the primitive forms, are all points which support this view, and exclude any hypothesis of a Flagellate origin, such as, on the contrary, is probably the case in the Ectospora (q.v.).

1. Order Myxosporidia. The Myxosporidia, or, more correctly, the dense masses formed by their spores, were well known to the earlier zoological observers. The parasites in fishes were called by Müller "fish-psorosperms," a name which has stuck to them ever since, although, as is evident from the meaning of the term ("mange-seed"), Müller had little idea of the true nature of the bodies. Other examples, infesting silkworms, have also long been known as "Pèbrine-corpules," from the ravaging disease which they produce in those caterpillars in France, in connexion with which Pasteur did such valuable work. The foundation of our present morphological and biological knowledge of the order was well laid by the admirable researches of Thélohan in 1805. In spite, however, of the contributions of numerous workers since then (e.g. Doeflein, Cohn, Stempell and others), there are still one or two very important points, such as the occurrence of sexual conjugation, upon which light has been required.

Although pre-eminently parasites of fishes, Myxosporidia also occur, in a few cases, in other Vertebrata (frogs and reptiles); no instance of their presence in a warm-blooded Vertebrate has, however, yet been described. One suborder (the Microsporidia or Cryptocystes) is pretty equally distributed between fishes on the one hand and Invertebrata—chiefly, but not exclusively, Arthropods—on the other. The parasites are frequently the cause of severe and fatal illness in their hosts, and devastating epidemics of Occurrence and habitat.
myxosporidiosis have often been reported (e.g. among carp and barbel in continental rivers, due to a *Myxobolus*, and among crayfish in France, to *Thelohanias*).

The seat of the invasion and the mode of parasitism are extremely varied. Practically any organ or tissue may be attacked, excepting, apparently, the testis and cartilage and bone. In one instance at least (that of *Nosema bombayis* of the silkworm) the parasites penetrate into the ova, so that true hereditary infection occurs, the progeny being born with the disease. The parasites may be either free in some lumen, such as that of the gall bladder or urinary bladder (not of the alimentary canal, or the body-cavity itself), when they are known as *coelosporic* forms; or in intimate relation with some tissue, intracellular while young but becoming intercellular in the adult phase (*histozoic* forms); or entirely intracellular (*cytosporic* forms). Among the histozoic and cytotoxic types, moreover, two well-defined conditions, concentration and diffuse infiltration, occur. In the former, the parasitic zone is strictly limited, and well-marked cysts are formed; in the latter, the infection spreads throughout the neighbouring tissue, and the parasitic development becomes inextricably mingled with the host's cells. Sometimes, as shown by Woodcock (45), there may be an attempt on the part of the host's tissue to circumscribe and check the growth of these parasitic areas, which results in the formation of *pseudocysts*, quite different in character from true cysts.

The most noticeable feature about the Myxosporidian trophozoite is its amoeboid and Rhizopod-like character. Pseudopodia of various kinds, from long slender ones (fig. 3, B) to short blunt lobose ones, are of general occurrence, being most easily observed, of course, in the free-living forms. The pseudopodia serve chiefly for movement and attachment, and, moreover, it should be noted, for the injection of solid food-particles, as in the case of *Amoebae*. The general protoplasm is divisible into ectoplasm and endoplasm. The former is a finely-granular layer, of which the pseudopodia are mainly constituted (fig. 3, A). In one or two instances (e.g. *Myxidium* *lieberkuhnii*) the ectoplasm shows a vertical striation, and in the older trophozoites breaks down partially, appearing like a fur of delicate, non-motile filaments. A somewhat similar modification is found in *Myxocystis*. The endoplasm is more fluid, and contains numerous inclusions of a granular nature, as well as vacuoles of varying size. In the endoplasm are lodged the nuclei, of which in an adult trophozoite there may be very many; they are all derived by multiplication from the single nucleus with which the young individuals begin life, the number increasing as growth proceeds.

Spore-formation goes on entirely in the endoplasm. The number of spores formed is very variable.

It may be as low as two (as in free-living forms, e.g. *Leptotheca*), in which case a large amount of trophic protoplasm is converted into spores; or, on the other hand, the number of spores may be very great (as in tissue-parasites), practically the whole of the parent-body being thus used up. The sporont may or may not encyst at the commencement of sporulation. In the free-living forms there is no cyst-membrane secreted; but in certain *Glugeidae*, on the other hand, the ectoplasm becomes altered into a firm, enclosing layer, the *ectoind*, which forms a thick cyst-wall (fig. 5). The process of sporulation begins by the segregation of small quantities of endoplasm around certain of the nuclei, to form little, rounded bodies, the *pansporoblasts*. There may be either very many or only few pansporoblasts developed; in some cases, indeed, there is only one, the sporont either itself becoming a pansporoblast (certain *Microsporidia*), or giving rise to a solitary one (*Ceratomyxidae*). The pansporoblast constituted, nuclear multiplication goes on preparatory to the formation of sporoblasts, which in their turn become spores (see figs. 4 and 5). Not all the nuclei thus formed, however, are made use of. In the *Phaeocystis* there are always two sporoblasts developed in each pansporoblast; in the *Cryptocystes* there may be from one to several. Around each sporoblast a spore-membrane is secreted, which usually has the form of two valves. It has recently been shown by Léger and Hesse (296) that, in many *Phaeocystis* at any rate, each of these valves is formed by a definite nucleated portion of the sporoblast.

The spores themselves vary greatly in size and shape (figs. 7 and 8). They may be as small as 1.5 μ by 1μ (as in a species of *Nosema*), or as large as 100 μ by 12 μ (as in *Ceratomyxa*). A conspicuous feature in the structure of a fully-developed spore is the polar-capsules, of which there may be either 1, 2, or 4 to each.
Phaeocythus in paracapsules are visible in the fresh condition, but not in the Cryptocysts. The polar capsule is an organella which recalls the nematocyst of a Hydrozoan, containing a spirally-coiled filament, often of great length, which is shot out on the application of a suitable stimulus. Normally, as was observed by M. f. pfeifferi, within an envelope, the paramecium (s.p.m.)

\[ \text{Myxosporidia, with two polar-capsules, and without an iodinophilous vacuole in the sporoplasma. Mostly "free"} \]
parasites. Gen. Sphaerospora. Four or five species are known from the kidneys or gall bladder of fishes (fig. 3, A). One, S. elegans, is interesting in that it affects a transition between the two sections, being disporous. Gen. Myxidium; spores elongated and fusiform, with a polar capsule at each extremity. The best known species is M. lieberkühni, from the urinary bladder of the pike. One or two species occur in reptiles. Other genera are Sphaeromyxa, Cystodiscus, Myxosoma and Myxoproteus.

Family Chloromyxidae. Spores with four polar capsules and no iodinophilous vacuole. One genus, Chloromyxum, of which several species are known; the type being C. leidygi, from the gall bladder of various Elasmobranchs (fig. 7, B). Family Myxolidae. Spores with two polar-capsules (exceptionally one), and with a characteristic iodinophilous vacuole in the sporoplasm. Typically tissue parasites of Teleosteans, often very dangerous. Genus Myxobolus. Spores oval or rounded, without a tail-like process. Very many species are known, which are grouped into three subsections; (a) forms with only one polar-capsule, such as M. piriformis, of the tench; (b) forms with two unequal capsules, e.g. M. dispar from Cyprinus and Lucius; and (c) the great majority of species with two equal polar-capsules, including M. mulleri, the type-species, from different fish, M. cyprini and M. pfefferi, the cause of deadly disease in carp and barbel respectively and others. Other genera are Henneguya and Hoferellus, differing from Myxobolus in having, respectively, one or two tail-like processes to the spore. Lentospora, according to Plehn (37), lacks an iodinophilous vacuole.

Family Coccomyidae. The pansporoblasts produce (probably) only one spore. Spore oval in 144 x 95 μ, with a single very large polar-capsule. Sporoplasm with no vacuole. Single genus Coccomyxa, with the characters of the family. One species, C. morsei, Léger and Hesse, from the gall bladder of the sardine. The spore generally resembles a Cryptocystid spore.

Suborder 2: Cryptocystid, Gurley (= Microsporidia, Balbiani). Spores minute, usually pear-shaped, with only one polar-capsule, which is visible only after treatment with reagents. The number of spores formed in each pansporoblast varies greatly in different forms.

Section (a): Polysporogenea. The trophozoite produces numerous pansporoblasts, each of which gives rise to many spores. Genus Glugea, with numerous species, of which the best-known is G. anomala, from the stickleback (fig. 1). The genus Myxozystis, which has been shown by Hesse (24) to be a true Microsporidian, is placed by Perez in this section, but this is a little premature, as Hesse does not describe the exact character of the sporulation, i.e. with regard to the number of pansporoblasts and the spores they produce.

Section (b): Oligosporogenea. The trophozoite becomes itself the (single) pansporoblast. In Plaskophora, the pansporoblast produces many spores; P. typicus, from the muscles of various fishes (fig. 2), is the type-species. In Thelohania, eight spores are formed; the different species are parasitic in Crustacea. In Gurleya, parasite in Daphnia, only four are formed; and, lastly, in Nosema (ex. N. pulvis, from Carcinus, and, most likely, N. bombecis, of the silk-worm), each pansporoblast produces only a single spore.

2. Order—Actinomyxida. This order comprises a peculiar group of parasites, first described by A. Stolc in 1899, which are restricted to Oligochaeta worms of the family Tubificidae. Most forms attack the intestinal wall, often destroying its epithelium over considerable areas; but one genus, Sphaeractinomyxon, inhabits the body-cavity of its host. The researches of Caullery and Mesnil (10-12) and of Léger (28 and 29) have shown that the parasites exhibit the typical features of the Endospora, and the spores possess the characteristic polar-capsules of the Myxosporidium spore, but differ therefrom by their more complicated structure.

The growth and development of an Actinomyxid have been recently worked out by Caullery and Mesnil in the case of Sphaeractinomyxon stolci. A noteworthy point is the differentiation of an external (covering) cellular layer, which affords, perhaps, the nearest approach to distinct tissue formation known among Protozoa. This cell-layer is formed soon after nuclear multiplication of the young trophozoites has begun, and is constituted by two nuclei and a thin, peripheral layer of cytoplasm. It remains binuclear throughout the whole period of development, and serves as a delicate cyst-membrane. The multiplication of the internal nuclei is accompanied by a corresponding division of the cytoplasm; so that instead of a multinucleate or plasmoidal condition, distinct uninucleate cells are formed, up to sixteen in number. These cells, as a matter of fact, are sexual elements or gametes; and eight of them can be distinguished from the other eight by slight differences in the nuclei. These gametes unite in two series, each couple being most probably composed of dissimilar members in other words, conjugation is slightly anisogamous. Each of these eight copulae gives rise to a spore.

As the name of the order implies, there are always eight spores formed. These differ from other Endosporan parasites in having invariably a ternary symmetry and constitution (fig. 9). The wall of the spore is composed of three valves, each formed from an enveloping cell, and three capsular cells, placed at the upper or anterior pole, and containing each a polar-capsule, visible in the fresh condition. The valves are usually prolonged into processes or appendages, whose form and arrangement characterize the genus; but in Sphaeractinomyxon the spore is spherical and lacks processes. The sporoplasm may be either a plasmoidal mass, with numerous nuclei, or may form a certain number of uninuclear sporozoites. A remarkable feature in the development of the spore is that the germinal tissue (sporoplasm) arises separate from and outside the cells which give rise to the spore-wall; later, when the envelopes are nearly developed, the sporoplasm penetrates into the spore.

Four genera have been made known. (1) Hexactinomyxon, Stolc. Spores having the form of an anchor with six arms; sporoplasm plasmoidal, situated near the anterior pole of the spore. One sp., H. anomala, from Platymeris. (2) Triactinomyxon, Stolc. Spores having the form of an anchor with three arms; distinct sporozoites, disposed near the anterior pole. T. ignotum, with eight spores, from Tubifex tubifex, and also from an unspecified Tubificid; another sp., unnamed, with 32 sporozoites, also from T. tenuis. (3) Sphaeractinomyxon, Stolc. Spore united to one another, each having two plasmoidal appendages; sporoplasm plasmoidal. One sp., S. tubificis, from T. tubifex. (4) Sphaeractinomyxon, C. and M. Spores spherical, without aliform prolongation; sporoplasm gives rise to many
sporozoites, occupying the whole spore. One sp., *S. stolci*, from *Citellus* and *Hemitubus*.

3. Order—**Sarcosporidia**. With the exception of one or two forms occurring in reptiles, these parasites are always found in warm-blooded Vertebrates, usually Mammals. They are of common occurrence in domestic animals, such as pigs, sheep, horses and (sometimes) cattle. A Sarcosporidian has also been described from man. The characteristic habitat is the striped muscle, generally of the oesophagus (fig. 10, A) and heart, but in acute cases the parasites overrun the general musculature. When this occurs, as often happens in mice, the result is usually fatal. Unless, however, the organism thus spread throughout the body, the host does not appear to suffer any serious consequences. In addition to the effects produced by the general disturbance to the tissues, the attacked animals have apparently to contend—at any rate in the case of *Sarcocystis tenella* in the sheep—with a poison secreted by the parasite. For Laveran and Mesnil (27) have isolated a toxin from this form, which they have termed sarcocystin.

In the early stages of growth, a Sarcosporidian appears as an elongated whitish body lodged in a muscle-fibre; this phase has long been known as a “Miescher's tube” or *Miescheria*. The youngest trophozoites that have been yet observed (by Bertram, 1) were multinucleate (fig. 11, A), but there is no reason to doubt that they begin life in a unicellular condition. The protoplasm is limited by a delicate cuticle. With growth, organelles corresponding to the Myxosporidian pansporoblasts are formed by the segregation internally of little uninuclear spheres of protoplasm. At the same time, a thick striated envelope is developed around the parasite, which later comes to look like a fur of fine filaments. The probable explanation of this feature (given by Vuillemin, 44) is that it is due to the partial breaking down of a stiff, vertically (or radially) striated external layer (fig. 12, A), such as is seen in *Myxidium lieberkühni*.

Immediately internal to this is a thin, homogeneous membrane, which sends numerous partitions or septa inwards; these divide up the endoplasm into somewhat angular chambers or alveoli (fig. 12). In each chamber is a pansporoblast, which divides up to produce many spores, hence the spores formed from different pansporoblasts are kept more or less separate. The pansporoblasts originate, in a growing Sarcosporidian, at the two poles of the body, where the peripheral endoplasm with its nuclei is chiefly aggregated. More internally, spore-formation is in progress; and in the centre, pansporoblasts full of ripe spores are found. By this time the parasite has greatly distended the muscle-fibre in which it has hitherto lain, absorbing, with its growth, practically all the contractile-substance, until it is surrounded only by the sarcolemma and sarcoplasm. It next passes into the adjacent connective-tissue, and in this phase has been distinguished from *Miescheria* as *Balineium*, under the impression that the two forms were quite distinct. In the later stages, the parasite may become more rounded, and a cyst may be secreted around it by the host's tissue. In these older forms, the most centrally placed spores degenerate and die, having become over-ripe and stale.

With regard to the spores themselves and what becomes of them, our knowledge is defective. Two kinds of reproductive germ have been described, termed respectively *gymnospores* (so-called sporozoites, “Rainey's corpuscles” and *chlamydospores*), or simply spores. It seems probable that the former are for endogenous or auto-infection, and the latter for infecting fresh hosts. Unfortunately, however, both kinds of germ are not yet known in the case of any one species. The gymnospores,

---

**ENDOSPORA**

---

![Image of Sarcosporidian parasites](image-url)
or reniform bodies which are more or less amoeboid, and capable of active movement at certain temperatures. They appear to be naked, and consist of finely granular protoplasm, containing a single nucleus and one or two vacuoles. The chlamydospores, or

Fig. 12.—A, Sarcocystis miesterhianana (Kühn) from the pig; late stage in which the body has become divided into numerous chambers or alveoli, each containing a number of germs.

B, Sarcocystis of the ox: section of a stage similar to fig. 12. a, Substance of muscle-fibre; b, envelope of parasite; c, nuclei of the muscle; d, parasitic germs (gymnospores); e, walls of the alveoli. In the peripheral alveoli are seen immature germs.

true spores, occur in S. tenella of sheep (fig. 13), and have been described by Laveran and Mesnil (28). They also are falciform, but one extremity is rounded, the other pointed. There is a very thin, delicate membrane, most unlike a typical, resistant spore-wall; and the spores themselves are extremely fragile and easily acted upon and deformed by reagents, even by distilled water. The rounded end of the spore contains a large nucleus, while at the other end is an oval, clear space, which, in the fresh condition, shows a distinct spiral striation. The exact significance of this structure has been much debated. In position and appearance it recalls the polar-capule of a Myxosporidial spore. The proof of this interpretation would be the expulsion of a filament on suitably stimulating the spore; while, however, some investigators have asserted that such a filament is extruded, this cannot be regarded as at all certain. Hence it is still doubtful whether this striated body really corresponds to a polar-capule.

Nothing whatever is known as to the natural means by which infection with Sarcocapsedia is brought about. Smith (39) showed that mice can be infected with Sarcocystis muris by simply feeding them on the flesh of infected mice. It is not very likely, however, that this represents the natural mode, even in the case of mice; and it certainly cannot do so in the case of Herbivora. The difficulty in the way is the delicacy of the spores, which seem totally unfitted to withstand external conditions. It may be that some alternative (intermediate) host is concerned in dispersal; but this has yet to be ascertained.

All known Sarcocapsedia are included in a single genus Sarcocystis, Lank. (=Miescheria + Balbiania, Blanchard.) Some of the principal species are: S. miescheriana, from pigs; S. tenella, from sheep; S. berthani, from horses; S. blanchardi, from Bovines; S. muris, from mice; S. platycaulis, from the gecko; and lastly, S. mandenmani, described from man.

4. Order—Haplosporida. The Sporozoa included in this order are characterized by the general simplicity of their development, and by the undifferentiated character of their spores. The order includes a great many forms, whose arrangement and classification have been recently undertaken by Caulery and Mesnil (15), to whom, indeed, most of our knowledge relating to the Haplosporida is due. The habitat of the parasites is sufficiently varied: Rotifers, Crustacea, Annelids and fishes furnishing most of the hosts. A recent addition to the list of Protozoa causing injury to man, a Haplosporidian, has been described by Minchin and Fantham (29d), who have termed the parasite Rhinosporidium, from its habitat in the nasal septum, where it produces pellucundaceous tumours.

Bertramia, a well-known parasite of the body-cavity of Rotifers, will serve very well to give a general idea of the life-cycle so far as it has yet been made out (fig. 14). The trophozoite begins life as a small, rounded uninucleate corpuscle, which as it grows, becomes multinucleate. The multinucleate body generally assumes a definite shape, often that of a sausage. Later, the protoplasm becomes segregated around each of the nuclei, giving the parasite a mulberry-like aspect; hence this stage is frequently known as a morula. The uninuclear cells thus formed are the spores, which are ultimately liberated by the break-up of the parent body. Each is of quite simple, undifferentiated structure, possesses a large, easily-visible nucleus, and gives rise in due course to another young trophozoite. In some instances, as described by
Minchin, the sporulating parasite becomes rounded off and forms a protective cyst, doubtless for the protection of the spores during dissemination.

In some forms (e.g. *Haplosporidium* and *Rhinosporidium*) the spore-mother-cells, instead of becoming each a single spore, as in *Bertramia*, give rise to several, four in the first case, many in the latter. Sometimes, again, the spore, while preserving the essentially simple character of the sporoplasm, may be enclosed in a spore-case; this may have the form of a little box with a lid or operculum, as in some species of *Haplosporidium*, or may possess a long process or tail, as in *Urosporidium* (fig. 15).

The *Haplosporidia* are divided by Caullery and Mesnil into three families, *Haplosporidae*, *Bertramidae* and *Coelospora*; one or two genera are also included whose exact position is doubtful.

(a) *Haplosporidae*: 3 genera, *Haplosporidium*, type-species *H. heterocerci*, *Urosporidium*, with one sp., *U. fuliginosum*; all parasitic in various Annelides; and *Anaurosporidium*, with the species *A. pelsercii*, from the sporocyst of *Trematodes*, parasitic on *Donax*. (b) *Bertramidae*: 2 genera, *Bertramia*, and *B. capitella* from an

name of *Ameobidium* had been given by Cienkowski. It has recently been shown, however, that this organism is most probably *A. pelsercii*. Another genus, *Exosporidium*, described by Sand (p.), is placed at present in the *Rhinosporidium* family. For details of the structure of these forms and others like *Siedleckia*, *Toxosporidium*, *Chileniopsis* *Joyeuxella* and *Meschinkinkaevia*, a comprehensive treatise on the Sporozoa, such as that of Minchin, should be consulted.

To complete this article, it will be sufficient to mention various enigmatic branchiopods, associated with different diseases, which are regarded by their describers as Protozoa. Among such is the "*Hiliosporidium carcinomatosum*" of Feinberg, which he finds in cancerous growths. *Cytotylus*, the name given to "Guarnieri's bodies" in small-pox and vaccinia, has been recently investigated by Calkins (3a), who has described a complex life-cycle for the alleged parasite. Other workers, however, such as Siegel, give a quite different account of these bodies, and, moreover, find similar ones in scarlet-fever, syphilis, &c.; while yet others (e.g. Prowazek) deny that they are parasitic organisms at all.

ENDYMION. In Greek mythology, son of Aethlius and king of Elis. He was loved by Selene, goddess of the moon, by whom he had fifty daughters, supposed to represent the fifty moons of the Olympian festal cycle. In other versions, Endymion was a beautiful youth, a shepherd or hunter whom Selene visited every night while he lay asleep in a cave on Mount Latmus in Caria (Pausanias v. 1; Ovid, Ars am. ili. 85). Zeus left him free to choose anything he might desire, and he chose an everlasting sleep, in which he might remain youthful for ever (Apollodorus i. 7).

According to others, Endymion's eternal sleep was a punishment inflicted by Zeus upon him because he ventured to fall in love with Hera, when he was admitted to the society of the Olympian gods (Schol. Theocritus iii. 49). The usual form of the legend, however, represents Endymion as having been put to sleep by Selene herself in order that she might enjoy his society undisturbed (Cicero, Tus. disp. i. 38). Some see in Endymion the nature of the underlying correlation which binds together the various natural agencies. But it is only in recent times that scientific investigation has definitely established that there is a quantitative relation of simple equivalence between them, whereby each is expressible in terms of heat or mechanical power; that there is a certain measurable quantity associated with each type of physical activity which is always numerically identical with a corresponding quantity belonging to the new type into which it is transformed, so that the energy, as it is called, is conserved in unaltered amount. The main obstacle in the way of an earlier recognition and development of this principle had been the doctrine of calorific, which was suggested by the principles and practice of caloriomy, and taught that heat is a substance that can be transferred from one body to another, but cannot be created or destroyed, though it may become latent. So long as this idea maintained itself, there was no possible compensation for the destruction of mechanical energy by friction; it appeared that mechanical effect had there definitely been lost. The idea that heat is itself convertible into power, and is in fact energy of motion of the minute visible parts of bodies, had been held by Newton and in a vague sense by Bacon, and indeed long before their time; but it dropped out of the ordinary creed of science in the following century. It held a place, like many other anticipations of subsequent discovery, in the system of Natural Philosophy of Thomas Young (1804); and the discrepancies attending current explanations on the caloric theory were insisted on, about the same time, by Count Rumford and Sir H. Davy. But it was not till the actual experiments of Joule verified the same exact equivalence between heat produced and mechanical energy destroyed, by whatever process that was accomplished, that the idea of caloric had to be definitely abandoned. Some time previously R. Mayer, physician of Heilbronn, had founded a weighty theoretical argument on the production of mechanical power in the animal system from the food consumed; he had, moreover, even calculated the value of a unit of heat, in terms of its equivalent in power, from the data afforded by Regnault's determinations of the specific heats of air at constant pressure and at constant volume, the former being the greater on Mayer's hypothesis (of which his calculation in fact constituted the verification) solely on account of the power required for the work of expansion of the gas against the surrounding constant pressure. About the same time Helmholtz, in his early memoir on the Conservation of Energy, constructed a cumulative argument by tracing the ramifications of the principle of conservation of energy throughout the whole range of physical science.

Mechanical and Thermal Energy.—The amount of energy, defined in this sense by convertibility with mechanical work, which is contained in a material system, must be a function of its physical state and chemical constitution and of its temperature. The change in this amount, arising from a given transformation in the system, is usually measured by degrading the energy that leaves the system into heat; for it is always possible to do this, while the conversion of heat back again into other forms of energy is impossible, because the form of heat is compensated degradation elsewhere. We may adopt the provisional view which is the basis of abstract physics, that all these other forms of energy are in their essence mechanical, that is, arise from the motion or strain of material or ethereal media; then their distinction from heat will lie in the fact that these motions or strains are simply co-ordinated, so that they can be traced and controlled or manipulated in detail, while the thermal energy subsists in irregular motions of the molecules or smallest portions of matter, which we cannot trace on account of the bluntness of our sensual perceptions, but can only measure as regards total amount.

Historical: Abstract Dynamics.—Even in the case of a purely mechanical system, capable only of a finite number of definite types of disturbance, the principle of the conservation of energy is very far from giving a complete account of its motions; it forms only one among the equations that are required to determine their course. In its application to the kinetics of invariable systems, after the time of Newton, the principle was emphasized as fundamental by Leibnitz, was then improved and generalized by the Bernoullis and by Euler, and was ultimately expressed in its widest form by Lagrange. It is recorded by Helmholtz that it was largely his acquaintance in early years with the works of those mathematical physicists of the previous century, who had formulated and generalized the principle as a help towards the theoretical dynamics of complex systems of masses, that started him on the track of extending the principle throughout the whole range of natural phenomena. On the other hand, the ascertained validity of this extension to new types of phenomena, such as those of electrodynamics, now forms a main foundation of our belief in a mechanical basis for these sciences.

In the hands of Lagrange the mathematical expression for the manner in which the energy is connected with the geometrical constitution of the material system became a sufficient basis for a complete knowledge of its dynamical phenomena. So far as statics was concerned, this doctrine took its rise as far back as Galileo, who recognized in the simpler cases that the work expended in the steady driving of a frictionless mechanical system is equal to its output. The expression of this fact was generalized in a brief statement by Newton in the Principia, and more in detail by the Bernoullis, until, in the analytical guise of the so-called principle of "virtual velocities" or virtual work, it finally became the basis of Lagrange's general formulation of dynamics. In its application to kinetics a purely physical principle, also indicated by Newton, but developed long after with masterly applications by d'Alembert, that the reactions of the infinitesimal parts of the system against the accelerations of their motions statically equilibrate the forces applied to the system as a whole, was required in order to form a sufficient basis, and one which Lagrange soon afterwards condensed into the single relation of Least Action. As a matter of history, however, the complete formulation of the subject of abstract dynamics actually
energetics

391

are (in 1758) from Lagrange's precise demonstration of the principle of Least Action for a particle, and its immediate extension, on the basis of his new Calculus of Variations, to a system of connected particles such as might be taken as a representation of any material system; but here too the same physical as distinct from mechanical considerations come into play as in d'Alembert's principle.

It is in the cases of systems whose state is changing so slowly that reactions arising from changing motions can be neglected, that the conditions are by far the simplest. In such systems, whether stationary or in a state of steady motion, the energy depends on the configuration alone, and its mathematical expression can be determined from measurement of the work required for a sufficient number of simple transformations; once it is thus found, all the statical relations of the system are implicitly determined along with it, and the results of all other transformations can be predicted. The general development of such relations is conveniently classed as a separate branch of physics under the name **Energetics**, first invented by W. J. M. Rankine; but the essential limitations of this method have not always been observed. As regards statical change, the complete specification of a mechanical system involves a geometrical configuration expressing its mechanical energy in terms thereof. Systems which have statical energy-functions of the same analytical form behave in corresponding ways, and can serve as models or representations of one another.

**Extension to Thermal and Chemical Systems**:—This dominant position of the principle of energy, in ordinary statical problems, has in recent times been extended to transformations involving change of physical state or chemical constitution as well as change of geometrical configuration. In this wider field we cannot assert that mechanical (or available) energy is never lost, for it may be degraded into thermal energy; but we can use the principle that on the other hand it can never spontaneously increase. If this were not so, cyclic processes might theoretically be arranged which would continue to supply mechanical power so long as energy of any kind remained in the system; whereas the irregular and uncontrollable character of the molecular motions and strains which constitute thermal energy, in combination with the vast number of the molecules, must place an effectual barrier on their unlimited operation. If the principle of **energetics**, as a form of a sufficient foundation for a theory of the kind of chemical and physical change, we have, therefore, to impart precision to this motion of available energy.

**Carnot's Principle: Entropy**:—The whole subject is involved in the new principle contributed to theoretical physics by Sadi Carnot in 1824, in which the far-reaching modern conception of cyclic processes was first scientifically developed. It was shown by Carnot, on the basis of certain axioms, whose theoretical foundations were subsequently corrected and strengthened by Clausius and Lord Kelvin, that a reversible mechanical process, working in a cycle by means of thermal transfers, which takes heat, say $H_1$, into the material system at a given temperature $T_1$ and delivers the part of it not utilized, say $H_2$, at a lower given temperature $T_2$, is more efficient, considered as a working engine, than any other such process, operating between the same two temperatures but not reversible, could be. This relation of inequality involves a definite law of equality, that the mechanical efficiencies of all reversible cyclic processes are the same, whatever be the nature of their operation or the material substances involved in the cycle; that in fact the efficiency is a function solely of the two temperatures at which the cyclically working system takes in and gives out heat. These considerations constitute a fundamental general principle to which all possible slow reversible processes, so far as they concern matter in bulk, must conform in all their stages; its application is almost coextensive with the scope of general physics, the special kinetic theories in which inertia is involved, being excepted. (See "Thermodynamics.")

If the working system is an ideal gas-engine, in which a perfect gas (known from experience to be a possible state of matter) is passed through the cycle, and if temperature is measured from the absolute zero by the expansion of this gas, then simple direct calculation on the basis of the laws of ideal gases shows that $H_2/T_2 = H_1/T_1$; and as by the conservation of energy the work done is $H_2 - H_1$, it follows that the efficiency, measured as the ratio of the work done to the supply of heat, is $1 - T_2/T_1$. If we change the sign of $H_2$ and thus consider heat as positive when it is restored to the system as is $H_1$, the fundamental equation becomes $H_1/T_1 + H_2/T_2 = c$; and as any complex reversible working system may be considered as compounded in various ways of chains of elementary systems of this type, whose effects are additive, the general proposition follows, that in any reversible complete cyclic change which involves the taking in of heat by the system of which the amount is $\delta H$, when its temperature ranges between $T_r$ and $T_l$, the equation $2\delta H/\theta - c$ holds good.

Moreover, if the changes are not reversible, the proportion of the heat supply that is utilized for mechanical work will be smaller, so that more heat will be restored to the system, and $2\delta H/\theta$, or, as it may be expressed, $f d\theta/T$, must have a larger value, and must thus be positive. The first statement involves further, that for all reversible paths of change of the system from one state $C$ to another state $D$, the value of $f d\theta/T$ must be the same, because any one of these paths and any other one reversed will be found in line with the general principle, whereas the change between the same states this integral must have a greater value (and so exceed the difference of entropies at the ends of the path).

The definite quantity represented by this integral for a reversible path was introduced by Clausius in 1854 (also adumbrated by Kelvin's investigations about the same time), and was named afterwards by him the increase of the entropy of the system in passing from the state $C$ to the state $D$. This increase, being thus the same for the unlimited number of possible reversible paths involving independent variation of all its finite co-ordinates, along which the system can pass, can depend only on the terminal states. The entropy belonging to a given state is therefore a function of that state alone, irrespective of the manner in which it has been reached; and this is the justification of the assignment to it of a special name, connoting a property of the system depending on its actual condition and not on its previous history. Every reversible change in an isolated system thus maintains the entropy of that system unaltered; no possible spontaneous change can involve decrease of the entropy; while any defect of reversibility results in utilising the motion of matter or motion in the system, necessarily leads to increase of entropy. For a physical or chemical system only those changes are spontaneously possible which would lead to increase of the entropy; if the entropy is already a maximum for the given total energy, and so incapable of further continuous increase under the conditions imposed upon the system, there must be stable equilibrium.

This definite quantity belonging to a material system, its entropy $\phi$, is thus concomitant with its energy $E$, which is also a definite function of its actual state by the law of conservation of energy; these, along with its temperature $T$, and the various co-ordinates expressing its geometrical configuration and its physical and chemical constitution, are the quantities with which the thermodynamics of the system deals. That branch of science develops the consequences involved in just two principles: (i) that the energy of every isolated system is constant, and (ii) that its entropy can never diminish; any complication that may be involved arises from complexity in the systems to which these two laws have to be applied.

**The General Thermodynamic Equation**:—When any physical or chemical system undergoes an infinitesimal change of state, we have $\delta E = \delta H + \delta U$, where $\delta H$ is the energy that has been acquired as heat from sources extraneous to the system during the change, and $\delta U$ is the energy that has been imparted by reversible agencies such as mechanical or electric work. It is, however, not possible to discriminate permanently between heat acquired and work imparted, for (unless for isothermal transformations) neither $\delta H$ nor $\delta U$ is the exact differential of a function of the constitution of the system and so independent of its previous history, although their sum $\delta E$ is such; but we can utilize the fact that $\delta H$ is equal to $\Theta \phi$ where $\phi$ is such, as has just been seen. Thus $E$ and $\phi$ represent properties of the system which, along with
ENERGETICS

in contents and matter are undergoing change. When we consider the whole being of volume \( v \) and under external pressure \( p \), while \( W \) is potential energy arising from physical forces such as those of gravity, capillarity, etc. The variables \( m_1, m_2, \ldots, m_n \) may not be all independent; for example, if the system were chloride of ammonium gas existing along with its gaseous products of dissociation, hydrochloric acid and ammonia, only one of the three masses would be independently variable. The sufficient number of these variables (independent components) together with two other variables, which may be total T and \( \phi \), specifies and determines the state of the system, considered as matter in bulk, at each instant. It is usual to include \( \delta W \) in \( \mu \delta m_1 + \ldots \); in all cases, where this is possible, the single equation

\[
\delta E = \delta T - \delta p \cdot v + \mu \delta m_1 + \mu \delta m_2 + \ldots + \mu \delta m_n
\]

(1)

thus expresses the complete variation of the energy-function \( E \) arising from change of state; and when the part involving the \( n \) constitutive differentials has been expressed in terms of the number of them that are really independent, this equation by itself becomes the unique expression of all the thermodynamic relations of the system. These are in fact the various relations ensuring that the right-hand side is an exact differential, and are of the type of reciprocal relations such as \( \delta m_1 / \delta p = \delta T / \delta m_1 \).

The condition that the state of the system be one of stable equilibrium is that \( \delta E \), the variation of entropy, be negative for all variations of the functions \( \mu \) and \( \phi \), which make \( \delta E \) vanish; for as \( \delta \phi \) cannot actually be negative for any spontaneous variation, none of these transformations can occur. From the form of the equation, this condition is the same as that \( \delta E - \delta T \phi \) must be positive for all possible variations of state of the system as above defined in terms of co-ordinates representing its constitution in bulk, without restriction.

We can change one of the independent variables expressing the state of the system from \( \phi \) to \( T \) by subtracting \( \delta (\phi T) \) from both sides of the equation of variation: then

\[
\delta (E - \phi T) = -\delta \phi (E - T) - \delta p \cdot v + \mu \delta m_1 + \ldots + \mu \delta m_n
\]

It follows that for isothermal changes, i.e., those for which \( \delta T \) is maintained null by an environment at constant temperature, the condition of stable equilibrium is that the function \( E - \phi T \) shall be a minimum. If the system is subject to an external pressure \( \phi \), which as well as the temperature is imposed constant from without and thus incapable of variation through internal changes, the condition of stable equilibrium is similarly that \( E - \phi T + p \) shall be a minimum.

A chemical system maintained at constant temperature by communication of heat from its environment may thus have several states of stable equilibrium corresponding to different minima of the function \( E - \phi T + p \) or even more, as there may be several minima of elevation on a landscape, one at the bottom of each depression; in fact, this analogy, when extended to space of \( n \) dimensions, exactly fits the case. If the system is sufficiently disturbed, for example, by electric shock, it may pass over (explosively) from a higher to a lower minimum, but never (without compensation from outside) in the opposite direction. The former passage, moreover, is often effected by introducing a new substance into the system; sometimes that substance is recovered unaltered at the end of the process, and then its action is said to be purely catalytic; its presence modifies the form of the function \( E - \phi T + p \). This may be obliterated between the two equilibrium states in the graphical representation.

There are systems in which the equilibrium states are but very slightly dependent on temperature and pressure within wide limits, outside which reaction takes place. Thus while there are cases in which a state of mobile dissociation exists in the system, which changes continuously as a function of these variables, there are others in which change does not sensibly occur at all until a certain temperature of reaction is attained, after which it proceeds very rapidly owing to the heat developed, and the system soon becomes sensibly permanent in a transformed phase by completion of the reaction. In some cases of this latter type the cause of the delay in starting lies possibly in passive resistance to change, of the nature of viscosity or friction, which is competent to convert an unstable mechanical equilibrium into a moderately stable one; but in most such reactions there seems to be no exact equilibrium at any temperature, short of the ultimate state of dissolved energy in which the reaction is completed, although the velocity of reaction is found to diminish exponentially with change of temperature, and thus becomes insignificant at a small interval from the temperature of pronounced activity.

Free Energy.—The quantity \( E - \phi T \) thus plays the same fundamental part in the thermal statics of general chemical systems at uniform temperature that the potential energy plays in the statics of mechanical systems of unchanging constitution. It is a function of the thermodynamical co-ordinates, the physical and chemical constitution, and the temperature of the system, which determines the conditions of stable equilibrium at each temperature; it is, in fact, the potential energy generalized so as to include temperature, and thus be a single function relating to each temperature but at the same time affording a basis of connection between the properties of the system at different temperatures. It has been called the free energy of the system by Helmholtz, for it is the part of the energy whose variation is connected with changes in the bodily structure of the system represented by the variables \( m_1, m_2, \ldots, m_n \), and not with the irregular molecular motions represented by heat, so that it can take part freely in physical transformations. Yet this holds good only subject to the condition that the temperature is not varied; it has been seen above that for the more general variation neither \( \delta \Phi \) nor \( \delta U \) is an exact differential, and no line of separation can be drawn between thermal and mechanical energies.

The study of the evolution of ideas in this, the most abstract branch of modern mathematical physics, is rendered difficult in the manner of most purely philosophical subjects by the variety of terminology, much of it only partially appropriate, that has been employed to express the fundamental principles by different investigators and at different stages of the development. Attentive examination will show, what is indeed hardly surprising, that the principles of the theory of free energy of Gibbs and Helmholtz had been already grasped and exemplified by Lord Kelvin in the very early days of the subject (see the paper "On the Thermoelectric and Thermomagnetic Properties of Matter, Part I." Quarterly Journal of Mathematics, No. 1, April 1855; reprinted in Phil. Mag., January 1858, and in Math. and Phys. Papers, vol. i. pp. 291, sqq.). Thus the striking new advance contained in the more modern work of J. Willard Gibbs (1875-1877) and of Helmhotz (1882) was rather the sustained general application of these ideas to chemical systems, such as the galvanic cell and dissociating gaseous systems, and in general fashion to heterogeneous concomitant phases. The fundamental paper of Kelvin connecting the electromotive force of the cell with the energy of chemical transformation is of date 1851, some years before the distinction between free energy and total energy had definitely crystallized out; and, possibly satisfied with the approximate exactness of his imperfect formula when applied to a Daniell's cell (infra), and deterred by absence of experimental data, he did not return to the subject. In 1852 he briefly announced (Proc. Roy. Soc. Edin.) the principle of the dissipation of mechanical (or available) energy, including the necessity of compensation elsewhere when restoration occurs, in the form that "any restoration of mechanical energy, without more than an equivalent of dissipation, is impossible"—probably even in vital activity; but a sufficient specification of available energy (cf. infra) was not then developed. In the paper above referred to, where this was done, and illustrated by full application to solid elastic systems, the total energy is represented by \( e \) and is named
ENERGETICS

393

"the intrinsic energy," the energy taken in during an isothermal transformation is represented by \( e \), which is defined as the change of potential energy, while the remainder \( e \) is the change of free (or mechanical or available) energy. The system is the unnamed quantity denoted by the symbol \( w \), which is the "work done by the applied forces" at uniform temperature. It is pointed out that it is \( w \) and not \( e \) that is the potential energy-function for isothermal change, of which the form can be determined directly by dynamical and physical experiment, and from which the units of energy and stress are to be derived—simply for the reason that for all reversible paths at constant temperature between the same terminal configurations, there must, by Carnot's principle, be the same gain or loss of heat. And a system of formulæ are given (5 to (11)—Ex. gr. \( e = w - \frac{dw}{dt} + \int s dt \) for finding the total energy \( e \) for any temperature \( t \) when \( w \) and the thermal capacity \( s \) of the system, in a standard state, have thus been ascertained, and another for establishing connection between the form of \( w \) for one temperature and its form for adjacent temperatures—which are identical with those developed by Helmholz long afterwards, in a state except that the temperature appears only as an unnamed integral. The progress of physical science is formally identified with the exploration of this function \( w \) for physical systems, with continually increasing exactness and range—except where pure kinetic considerations prevail, in which cases the wider Hamiltonian dynamical formulation is fundamental. Another aspect of the matter will be developed below.

A somewhat different procedure, in terms of entropy as fundamental, has been adopted and developed by Planck. In an isolated system the trend of change must be in the direction which increases the entropy \( S \), by Clausius' form of the principle. But in experiment it is a system at constant temperature rather than an adiabatic one that usually is involved; this can be attained formally by including in the isolated system (cf. infra) a source of heat at that temperature and of unlimited capacity, when the energy of the original system increases by \( E \). The source must give up its amount \( E \) and its entropy therefore diminishes \( \frac{E}{T} \). Thus for the original system maintained at constant temperature \( T \) it is \( \delta S = -\frac{E}{T} \) that must always be positive in spontaneous change, which is the same criterion as was reached above. Reference may also be made to H. A. Lorentz's Collected Scientific Papers, part i.

A striking anticipation, almost contemporaneous, of Gibbs's thermodynamic potential theory (infra) was made by Clerk Maxwell in connexion with the discussion of Andrews's experiments on the critical temperature of mixed gases, in a letter published in Sir G. G. Stokes's Scientific Correspondence (vol. ii. p. 34).

Available Energy.—The same quantity \( \phi \), which Clausius named the entropy, arose in various ways in the early development of the subject, in the train of ideas of Rankine and Kelvin relating to the expression of the available energy \( A \) of the material system. Suppose there were accessible an auxiliary system containing in \( \delta A \) a quantity of heat at absolute temperature \( T_0 \), forming a condenser into which heat can be discharged from the working system, or from which it may be recovered at that temperature: we proceed to find how much of the heat of our system is available for transformation into mechanical work, in a process which reduces the whole system to the temperature of this condenser. Provided the process of reduction is performed reversibly, it is immaterial, by Carnot's principle, in what manner it is effected: thus in following it out in detail we can consider each elementary quantity of heat \( \delta H \) removed from the system as set aside at its actual temperature between \( T \) and \( T+\delta T \) for the production of mechanical work \( 6W \) and the residue of it \( 6H_0 \) as directly discharged into the condenser at \( T_0 \). The principle of Carnot gives \( \delta H/T = \delta H_0/T_0 \), so that the portion of the heat \( \delta H \) that is not available for work is \( \delta H_0 \), equal to \( \delta H/T_0 \). In the whole process the part not available in connexion with the condenser at \( T_0 \) is therefore \( \delta H/T_0 \). This quantity must be the same whatever reversible process is employed: thus, for example, we may first transform the system reversibly from the state \( C \) to the state \( D \), and then from the state \( D \) to the final state of uniform temperature \( T_0 \). It follows that the value of \( T_0 \delta H/T_0 \), representing the heat degraded, is the same along all reversible paths of transformation from the state \( C \) to the state \( D \); so that the function \( T_0 \delta H/T_0 \) is the excess of a definite quantity \( \phi \) connected with the system in the former state as compared with the latter.

It is usual to change the law of sign of \( \delta \phi \) so that gain of heat by the system is reckoned positive; then, relative to a condenser of unlimited capacity at \( T_0 \), the state \( C \) contains more mechanically available energy than the state \( D \) by the amount \( E_0 - E_0 + T_0 \delta \phi = T_0 \delta \phi \). In this way the existence of an entropy function with a definite value for each state of the system is again seen to be the direct analytical equivalent of Carnot's axiom that no process can be more efficient than a reversible process between the same initial and final states. The name "motive energy" of a system was proposed by Lord Kelvin in 1879 for this conception of available energy. It is here expressed as relative to a condenser of unlimited capacity at an assigned temperature \( T_0 \); some such specification is necessary to the definition; in fact, if \( T_0 \) were the absolute zero, this would be mechanically available.

But we can obtain an intrinsically different and self-contained comparison of the available energies in a system in two different states at different temperatures, by ascertaining how much energy will be dissipated in each in a reduction to the same standard state of the system itself, at a standard temperature \( T_0 \). We have only to reverse the operation, and change back this standard state to each of the others in turn. This will involve abstractions of heat \( \delta H_0 \) from the various portions of the system in the standard state, and returns of \( \delta H \) to the state at \( T_0 \); if this return were \( \delta H/T_0 \), instead of \( \delta H \), there would be no loss of availability in the direct process; hence there is actual dissipation \( \delta H - \delta H/T_0 \), that is \( T_0 \delta \phi_0 \). On passing from state \( T \) to state \( T_0 \), the result is a change in the number of degrees of the dissipation will represent the energy of the system that has become unavailable. Thus in this sense \( E - \delta H + \delta H_0 - \delta H/T_0 \) represents for each state the amount of energy that is available; but instead of implying an unlimited source of heat at the standard temperature \( T_0 \), it implies that there is no extraneous source. The available energy thus defined differs from \( E - \delta H + \delta H_0 - \delta H/T_0 \), the free energy of Helmholtz, or the work function of the applied forces of Kelvin, which involves no reference to any standard state, by a simple linear function of the temperature alone which is immutable as regards its applications.

The determination of the available mechanical energy arising from differences of temperature between the parts of the same system is a more complex problem, because it involves a determination of the common temperature to which reversible processes will ultimately reduce them; for the simple case in which no changes of state occur the energy will be given by Lord Kelvin in 1853, in connexion with the above train of ideas (cf. Tait's Thermodynamics, §179). In the present exposition the system is sensibly in equilibrium at each stage, so that its temperature \( T \) is always uniform throughout; isolated portions at different temperatures would be treated as different systems.

Thermodynamic Potentials.—We have now to develop the relations involved in the general equation (1) of thermodynamics. Suppose the material system includes two coexistent states or phases, with opportunity for free interchange of constituents—for example, a salt solution and the aqueous vapour in equilibrium with it. Then in equilibrium a slight transfer of \( m \) of the water-substance of mass \( m_w \) constituting the vapour, into the water-substance of mass \( m_w \) existing in the solution, should not produce any alteration of the first order in \( E + \delta \phi \); therefore \( m_w \) must be equal to \( m_w \). The quantity \( m_w \) is called by Willard Gibbs the corresponding substance of mass \( m_w \); it may be defined as its marginal available energy per unit mass at the given temperature. If then a system involves in the way coexistent phases which remain permanently separate, the potentials of any constituent must be the same in all of them in which that constituent exists, for otherwise it would tend to pass
from the phases in which its potential is higher to those in which it is lower. If the constituent is non-existent in any phase, its potential when in that phase would have to be higher than in the others in which it is actually present; but as the potential increases logarithmically when the density of the constituent is indefinitely diminished, this condition is automatically satisfied—or, more strictly, the constituent cannot be entirely absent, but the presence of the merest trace will suffice to satisfy the condition of equality of potential. When the action of the force of gravity is taken into account, the potential of each constituent must include the gravitational potential $gh$; in the equilibrium state the total potential of each constituent, including this part, must be the same throughout all parts of the system into which it is freely mobile. An example is Dalton's law of the independent distributions of the gases in the atmosphere, if it were in a state of rest. A similar statement applies to other forms of mechanical potential energy arising from actions at a distance.

When a slight constitutive change occurs in a galvanic element at given temperature, producing available energy of electric current, in a reversible manner and isothermally, at the expense of chemical energy, it is the free energy of the system $E - T \delta A$, not its total intrinsic energy, whose value must be conserved during the process. Thus the electromotive force is equal to the change of this free energy per electrochemical equivalent of reaction in the cell. This proposition, developed by Gibbs and later by Helmholtz, modifies the earlier one of Kelvin—which tacitly assumed all the energy of reaction to be available—except in the cases such as that of a Daniell's cell, in which the magnitude of the electromotive force does not depend sensibly on the temperature.

The effects produced on electromotive forces by difference of concentrations in dilute solutions can thus be accounted for and traced out, from the knowledge of the form of the free energy for such cases; as also the effects of pressure in the case of gas batteries. The free energy does not sensibly depend on whether the substance is solid or fused—for the two states are in equilibrium at the temperature of fusion—though the total energy differs in these two cases by the heat of fusion; for this reason, as Gibbs pointed out, voltaic potential-differences are the same for the fused as for the solid state of the substances concerned.

**Relations involving Constitution only.**—The potential of a component in a given solution can depend only on the temperature and pressure of the solution, and the densities of the various components, including itself; as no distance-actions are usually involved in chemical physics, it will not depend on the aggregate masses present. The example above mentioned, of two coexistent phases liquid and vapour, indicates that there may thus be relations between the constitution of the phases present in a chemical system which do not involve their total masses. These are developed in a very direct manner in Willard Gibbs's original procedure. In so far as attractions at a distance (a uniform force such as gravity being excepted) and displacing actions at the interfaces between the phases are inoperative, the fundamental equation (1) can be integrated. Increasing the volume $k$ times, and all the masses to the same extent—in fact, placing alongside each other $k$ identical systems at the same temperature and pressure—will increase $\phi$ and $E$ in the same ratio $k$; thus $E$ must be a homogeneous function of the first degree of the independent variables $\phi$, $v$, $m_1$, ..., $m_n$, and therefore by Euler's theorem relating to such functions

$$E = T \phi - \rho v + \mu_1 m_1 + \ldots + \mu_n m_n. $$

This integral equation merely expresses the additive character of the energies and entropies of adjacent portions of the system at uniform temperature, and thus depends only on the absence of sensible physical action directly across finite distances. If we form it from the expression for the complete differential $dE$, and subtract (1), there remains the relation

$$0 = \delta \phi + \mu v + \delta \mu_1 m_1 + \ldots + \delta \mu_n m_n. $$

(2)

This implies that in each phase the change of pressure depends on and is determined by the changes in $T$, $\mu_1$, ..., $\mu_n$ alone; as we know beforehand that a physical property like pressure is an analytical function of the state of the system, it is therefore a function of these $n + 1$ quantities. When they are all independent, the densities of the various constituents and of the entropy in the phase are expressed by the partial fluxions of $\rho$ with respect to them: thus

$$\frac{\phi}{\rho} \frac{d\rho}{dV}, \quad \frac{\mu_1}{\rho} \frac{d\rho}{dV}, \ldots. $$

But when, as in the case above referred to of chloride of ammonium gas existing partially dissociated along with its constituents, the masses are not independent, necessary linear relations, furnished by the laws of definite combining proportions, subsist between the partial fluxions, and the form of the function which expresses $\rho$ is thus restricted, in a manner which is easily expressible in each special case.

This proposition that the pressure in any phase is a function of the temperature and of the potentials of the independent constituents, thus appears as a consequence of Carnot's axiom combined with the energy principle and the absence of effective actions at a distance. It shows that at a given temperature and pressure the potentials are not all independent, that there is a necessary relation connecting them. This is the *equation of state* or constitution of the phase, whose existence forms one mode of expression of Carnot's principle, and in which all the properties of the phase are involved and can thence be derived by simple differentiation.

**The Phase Rule.**—When the material system contains only a single phase, the number of independent variations, in addition to change of temperature and pressure, that can spontaneously occur in its constitution is thus one less than the number of its independent constituents. But where several phases coexist in contact in the same system, the number of possible independent variations may be much smaller. The present independent variables $\mu_1, \ldots, \mu_n$ are specially appropriate in this problem, because each of them has the same value in all the phases. Now the system has its own characteristic equation, giving a relation between $\delta \phi$, $\delta T$, and $\delta \mu_1, \ldots, \delta \mu_n$, or such of the latter as are independent; if $r$ phases coexist, there are $r$ such relations; hence the number of possible independent variations, including those of $r$ and $T$, is reduced to $m - r - 2$, where $m$ is the number of independently variable chemical constituents which the system contains. This number of degrees of constitutive freedom cannot be negative; therefore the number of possible phases that can coexist alongside each other cannot exceed $m + 2$. If $m + 2$ phases actually coexist, there is no variable quantity in the system, thus the temperature and pressure and constitutions of the phases are all determined; such is the triple point at which ice, water and vapour exist in presence of each other. If there are $m + 1$ coexistent phases, the system can vary in one respect only; for example, at any temperature of water-substance different from the triple point two phases only, say liquid and vapour, or liquid and solid, coexist, and the pressure is definite, as also are the densities and potentials of the components. Finally, when but one phase, say water, is present, both temperature and pressure can vary independently. The first example illustrates the case of systems, physical or chemical, in which there is only one possible state of equilibrium, forming a point of transition between different constitutions; in the second type each temperature has its own completely determined state of equilibrium; in other cases the constitution in the equilibrium state is indeterminate as regards the corresponding number of degrees of freedom. By aid of this phase rule of Gibbs the number of different chemical substances actually interacting in a given complex system can be determined from observation of the degree of spontaneous variation which it exhibits; the rule thus lies at the foundation of the modern subject of chemical equilibrium and continuous chemical change in mixtures or alloys, and in connexion it has been widely applied and developed in the experimental investigations of Kekulé and van't Hoff and other chemicalists, mainly of the Dutch school.

**Extent to which the Theory can be practically developed.**—It is only in systems in which the number of independent variables is small that the forms of the various potentials, or the form of the
focal characteristic equation expressing the energy of the system in terms of its entropy and constitution, or the pressure in terms of the temperature and the potentials, which includes them all,—can be readily approximated to by experimental determinations. Even in the cases of the system of mixtures which it is customary to avoid introducing the unknown molecular constant \( a \) by working with the available energy per "gramme-molecule," that is, for a number of grammes expressed by the molecular weight of the substance; this is a constant multiple of the temperature and a function of the pressure, and has the value of entropy of the substance, or above, to the law of the combined gases. Thus, to bring all of the substances of a gas mixture into conform with the laws of the combined gases, as expressed by the equation of state, the bond between the separate fixed volumes which are being combined is such that the pressure of the mixture is expressed as the sum of all of the single combined volumes, which may be combined in cycles, for example, either (i) by diffusion through a porous partition, taking account of the work of the surfaces, or (ii) by utilizing the modified constitution toward the chamber of the combined gases, which expresses the law of gravity, or (iii) by reversible absorption of a single component.

If we employ in place of available energy the form of characteristic equation which gives the pressure in terms of the temperature and the mixture of the solute substance, though possibly the centre of a complex of molecules of the solvent, and for the other parts of the theory, the same order of importance it has in the theory of alloys. The study of the phenomena of condensation in a mixture of two gases or vapours, initiated by Andrews and developed in this manner by van der Waals and his pupils, forms a case in point (see CONDENSATION OF GASES).

Dilute Components: Perfect Gases and Dilute Solutions.—There are, however, two simple limiting cases, in which the theory can be completed by a determination of the functions involved in it, which throw much light on the phenomena of actual systems not far removed from these ideal limits. They are the cases of mixtures of perfect gases, and of very dilute solutions.

If, however, we express the pressure in terms of the temperature and the potential, to a very dilute solution of substances \( m_1, m_2, \ldots, m_n \) in a solvent substance \( m_0 \) and vary the co-ordinate \( m_0 \) alone, \( \rho \) and \( T \) remaining unvaried, we have in the equation state

\[
\sum_{i=1}^{n} m_i \frac{d a_i}{d m_i} + \sum_{i=1}^{n} m_i \frac{d a_i}{d m_0} = 0
\]

where every \( m \) except \( m_0 \) is very small, while \( \sum m_i \frac{d a_i}{d m_0} \) is presumably finite. As the second term is thus finite, this requires that the total potential of each component \( m_i \), which is \( m_i \frac{d a_i}{d m_i} \), shall be finite, say \( k \), in the limit when \( m_i \) is null. Thus for very small concentrations the potential \( k \) of a dilute component must be of the form \( \log m_i / \lambda_i \) being proportional to the logarithm of the density of that component; it thus tends logarithmically to an infinite value at evanescent concentrations, showing that removal of the last traces of any impurity would demand infinite proportionate expenditure of available energy, and is therefore practically impossible with finite intensities of force. It is thus indicated that in the formation of a solid \( m_0 \) is not uniformly distributed throughout the phase; thus it remains possible for the growth of a crystal at its surface in aqueous solution to extrude all the water except such as is in some form of chemical combination.

The precise value of this logarithmic expression for the potential can be readily determined for the case of a perfect gas from its characteristic properties, and can be thence extended to other dilute forms of matter, and from the thermodynamic point of view, the functions of the temperature and of the potential, and the pressure, and the entropy of the mixture, which are made up of the sum of the inner work of all the molecules of one unit volume. The increment of heat received by the unit volume of the gas is \( dH = p \, dv + RdT \), \( \kappa \) being then the specific heat at constant volume, which can be a function only of the temperature. Thus

\[ A = + a_0 + a_1 + a_2 + \cdots + a_n \]

and the available energy \( A \) per unit mass is \( E = T \Phi + \Phi dT \) where \( \Phi = \sum_{i=1}^{n} m_i \frac{d a_i}{d m_i} \), the integral being for a standard state, and \( \kappa \) being intrinsic energy of chemical constitution; so that

\[ A = + a_0 + a_1 + a_2 + \cdots + a_n = + R \frac{T \log N}{R} = + \frac{1}{N} \sum \frac{1}{N} \log N = + \log \frac{N}{m}, \]
that if a body $A$ is in temperature-equilibrium with $B$, and $B$ with $C$, then $A$ must be in equilibrium with $C$ directly. This argument can be applied, by aid of adiabatic partitions, even when the bodies are in a field of force so that mechanical work is required to change their geometrical arrangement; it was in fact employed by Maxwell to extend from the case of a gas to that of any other system the proposition that the temperature is the same all along a vertical column in equilibrium under gravity.

It had been shown from the kinetic theory by Maxwell that in a gas-column the mean kinetic energy of the molecules is the same at all heights. If the only test of equality of temperature consisted in bringing the bodies into contact, this would be rather a proof that thermal temperature is of the same physical nature in all parts of the field of force; but temperature can also be equalized across a distance by radiation, so that this law for gases is itself already necessitated by Carnot’s general principle, and merely confirmed or verified by the special gas-theory. But without introducing into the argument the existence of radiation, the uniformity of temperature throughout all phases in equilibrium is necessitated by the doctrine of energetics alone, as otherwise, for example, the raising of a quantity of gas to the top of the gravitational column in an adiabatic enclosure together with the lowering of an equal mass to the bottom would be a source of power, capable of unlimited repetition.

**Laws of Chemical Equilibrium based on Available Energy.**—

The complete theory of chemical and physical equilibrium in gaseous mixtures and in very dilute solutions may readily be developed in terms of available energy (cf. Phil. Trans., 1897, A, pp. 266-380), which forms perhaps the most vivid and most direct procedure. The available energy per molecule of any kind, in a mixture of perfect gases in which there are $N$ molecules of that kind per unit volume, has been found to be $d + R'T\log N$ where $R'$ is the universal physical constant connected with $R$ above. This expression represents the marginal increase of available energy due to the introduction of one more molecule of that kind into the system as actually constituted. The same formula also applies, by what has already been stated, to substances in dilute solution in any given solvent. In any isolated system in a mobile state of reaction or of internal dissociation, the condition of chemical equilibrium is that the available energy at constant temperature is a minimum, therefore that it is stationary, and slight change arising from fresh reaction would not sensibly alter it. Suppose that this reaction, per molecule affected by it, is equivalent to introducing $n_1$ molecules of type $N_1$, $n_2$ of type $N_2$, &c., into the system, $n_1$, $n_2$ being the numbers of molecules of the different types that take part in the reaction, as shown by its chemical equation, reckoned positive when they appear, negative when they disappear. Then in the state of equilibrium

\[ n_1(a' + R'T\log b_1 N_1) + n_2(a' + R'T\log b_2 N_2) + \ldots \]

must vanish. Therefore $N_1n_1N_2n_2\ldots$ must be equal to $K$, a function of the temperature alone. This law, originally based by Guldberg and Waage on direct statistics of molecular interaction, expresses for each temperature the relation connecting the densities of the interacting substances, in dilution comparable as regards density with the perfect gaseous state, when the reaction has come to the state of mobile equilibrium.

All properties of any system, including the heat of reaction, are expressible in terms of its available energy $A$, equal to $E - Ta + \phi T$. Thus as the constitution of the system changes with the temperature, we have

\[ \frac{dA}{dT} = \frac{dE}{dT} + \frac{dW}{dT} - (\phi - \phi_0) \]

where

\[ dE = -\delta H + \delta W, \quad \delta H = Ta\phi. \]

**ENERGETICS**

This general formula, applied differentially, expresses the heat $\delta E - \delta W$ absorbed by a reaction in terms of $\delta A$, the change produced by it in the available energy of the system, and of $\delta W$, the mechanical and electrical work done on the system during its progress.

In the problem of reaction in gaseous systems or in very dilute solution, the change of available energy per molecule of reaction has just been found to be

\[ \delta A = -\Delta \phi + R'T\log K', \quad \text{where } K' = \beta_1\beta_2^2\ldots K; \]

thus, when the reaction is spontaneous without requiring external work, the heat absorbed per molecule of reaction is

\[ -T^2 \frac{d\Delta \phi}{dT} + \log K. \]

This formula has been utilized by van’t Hoff to determine, in terms of the heat of reaction, the displacement of equilibrium in various systems arising from change of temperature; for $K$, equal to $N_1^*N_2^*\ldots$, is the reaction-parameter through which alone the temperature affects the law of chemical equilibrium in dilute systems.

**Interfacial Phenomena: Liquid Films.**—The characteristic equation hitherto developed refers to the state of an element of mass in the interior of a homogeneous substance; it does not apply to matter in the neighbourhood of the transition between two adjacent phases. A remarkable analysis has been developed by J. W. Gibbs in which the present methods concerning matter in bulk are extended to the phenomena at such an interface, without the introduction of any molecular theory; it forms the thermodynamic completion of Gauss’s mechanical theory of capillarity, based on the early form of the principle of total energy. The validity of the fundamental doctrine of available energy, so far as regards all mechanical actions in bulk such as surface tensions, is postulated, even when applied to interfacial layers so thin as to be beyond our means of measurement; the argument from perpetual motions being available here also, as soon as we have experimentally ascertained that the said tensions are definite physical properties of the state of the interface and not merely accidental phenomena. The procedure will then consist in assuming a definite excess of energy, of entropy, and of the masses of the various components, each per unit surface, at the interface, the potential of each component being of necessity, in equilibrium, the same as it is in the adjacent masses.

The interfacial transition layer thus provides in a sense a new surface-phase coexistent with those on each side of it, and having its own characteristic equation. It is only the extent of the interface and not its curvatures that need enter into this relation, because any slight influence of the latter can be eliminated from the equation by slightly displacing the position of the surface which is taken to represent the interface geometrically. By an argument similar to one given above, it is shown that one of the forms of the characteristic equation is a relation expressing the surface tension as a function of the temperature and the potentials of the various components present on the two sides of the interface; and from the differentiation of this the surface densities of the superficial distributions of these components (as above defined) can be obtained. The conditions that a specified new phase may become developed when two other given ones are brought into contact, i.e., that a chemical reaction may start at the interface, are thence formally expressed in terms of the surface tensions of the three transition layers and the pressures in the three phases. In the case of a thin soap-film, sudden extension of any part reduces the interfacial density of each component at each surface of the film, and so alters the surface tension, which requires time to recover by the very slow diffusion of dissolved material from other parts of the thin film; the system being stable, this change must be an increase of tension, and constitutes a species of elasticity in the film. Thus in a vertical film the surface tension must be greater in the higher parts, as they have to sustain the weight of the lower parts; the upper parts, in fact, stretch until the superficial densities of the components there situated are reduced to the amounts that
ENERGETICS

397

correspond to the tension required for this purpose. Such a film could not therefore consist of pure water. But there is a limit to these processes: if the film becomes so thin that there is no water in bulk between its surfaces, the tensions cannot adjust themselves in this slow way by migration of components from one part of the film to another; if the film can survive at all after it has become of molecular thickness, it must be as a definite molecular structure all across its thickness. Of such type are the black spots that break out in soap-films (suggested by Gibbs and proved by the measures of Reindol and Rücker): the spots increase in size because their tension is less than that of the surrounding film, but their indefinite increase is presumably stopped in practice by some clogging or viscous agency at their boundary.

Transition to Molecular Theory.—The subject of energetics, based on the doctrine of available energy, deals with matter in bulk and is not concerned with its molecular constitution, which it is expressly designed to eliminate from the problem. This analysis of the phenomena of surface tension shows how far the principle of negation of perpetual motions can carry us, into regions which at first sight might be classed as molecular. But, as in other cases, it is limited to pointing out the general scheme of results which have the same tendency to habit as the chemical philosophy can have their play. There is now a considerable body of knowledge correlating surface tension with chemical constitution, especially to a certain extent with the numerical density of the distribution of molecules; thus R. Eötvös has shown that a law of proportionality exists for wide classes of substances between the temperature-gradient of the surface tension and the density of the molecules over the surface layer, which varies as the two-thirds power of the number per unit volume (see CHEMISTRY: Physical). This takes us into the sphere of molecular science, where at present we have only such indications largely derived from experiment, if we except the mere notion of inter-atomic forces of unknown character on which the older theories of capillarity, those of Laplace and Poisson, were constructed.

In other topics the same restrictions on the scope of the simple stastical theory of energy appear. From the ascertained behaviour in certain respects of gaseous media we are able to construct their characteristic equation, and correlate their remaining relations by means of its consequences. Part of the experimental knowledge required for this purpose is the values of the gas-constants, which prove to be the same for all nearly perfect gases.

The doctrine of energetics by itself can give no clue as to why this should be so; it can only construct a scheme for each simple or complex medium on the basis of its own experimentally determined characteristic equation. The explanation of uniformities in the intrinsic constitutions of various media belongs to molecular theory, which is a distinct and in the main more complex and more speculative department of knowledge. When we proceed further and find, with van 't Hoff, that these same universal gas-constants reappear in the relations of very dilute solutions, our demand for an explanation such as can only be provided by molecular theory (as supra) is intensely stimulated. But except in respects such as these the doctrine of energetics gives a complete synthesis of the course and relations of the chemical reactions of matter in bulk, from which we can eliminate atomism altogether by restating the merely numerical atomic theory of Dalton as a principle of equivalent combining proportions. Of recent years there has been a considerable number of chemists who insist on this procedure as a purification of their science from the hypothetical ideas as to atoms and molecules, in terms of which its experimental facts have come to be expressed. A complete system of doctrine can be developed in this manner, but its scope will be limited. It makes use of one principle of correlation, the doctrine of available energy, and discards another such principle, the atomic theory. Nor can it be said that the one principle is really more certain and definite than the other. This may be illustrated by what has sometimes by German writers been called Gibbs's paradox: the energy that is available for mechanical effect in the inter-diffusion of given volumes of two gases depends only on these volumes and their pressures, and is independent of what the gases are; if the gases differed only infinitesimally in constitution it would still be the same, and the question arises where we are to stop, for we cannot suppose the inter-diffusion of two identical gases to be a source of power. This then looks like a real failure, or rather limitation, of the principle; and there are other such, that can only be satisfactorily explained by aid of the complementary doctrine of molecular theory. That theory, in fact, shows that the more nearly identical the gases are, the slower will be the process of inter-diffusion, so that the mechanical energy will indeed be available, but only after a time that becomes indefinitely prolonged. It is a case in which the simple doctrine of energetics becomes inadequate before the limit is reached. The phenomena of highly rarefied gases provide other cases. And in fact the only reason hitherto thought of for the invariable tendency of available energy to diminish, is that it represents the general principle that in the kinetic play of a vast assemblage of independent molecules individually beyond our control, the normal tendency is for the regularities to diminish and the motions to become less correlated: short of some such reason, it is an unexplained empirical principle. In the special departments of dynamical physics on the other hand, the molecular theory, there dynamical phenomena that for mathematical reasons difficult and less definite, is an indispensable part of the framework of calculation. In recent years, however, the experimental methods and instruments. Without molecular theory the clue which has developed into spectrum analysis, bringing with it stellar chemistry and a new physical astronomy, would not have been available; nor would the laws of diffusion and conduction in gases have attained more than an empirical form; nor would it have been possible to weave the phenomena of electromodynamics and radiation into an entirely rational theory.

The doctrine of available energy, as the expression of thermodynamic theory, is directly implied in Carnot's Essai of 1824, and constitutes, in fact, its main theme; it took a fresh start, in the light of fuller experimental knowledge regarding the nature of heat, in the early memoirs of Rankine and Lord Kelvin, which may be found in their Collected Scientific Papers; a subsequent exposition occurs in Maxwell's Theory of Heat; its most familiar form of statement is Lord Kelvin's principle of the dissipation of available energy. Its principles were very early applied by James Thomson to a problem, that of the influence of stress on the growth of crystals in thick aggregations. The "thermodynamic function" introduced by Rankine into its development is the same as the "entropy" of the material system, independently defined by Clausius about the same time. Clausius's form of the principle, that in an adiabatic system the entropy tends continually to increase, has been placed by Professor Willard Gibbs, of Yale University, at the foundation of his magnificent but complex and difficult development of the theory. His monumental memoir "On the Equilibrium of Heterogeneous Substances," first published in Trans. Connecticut Academy (1876-1878), made a clean sweep of the subject; and workers in the modern experimental science of physical chemistry have returned to it again and again to find their empirical principles forecasted in the light of pure theory, and to derive fresh inspiration for new departures. As specially preparatory to Gibbs's general discussion may be mentioned Lord Rayleigh's theory on the thermodynamics of gaseous diffusion (Phil. Mag., 1876), which was expounded by Maxwell in the 9th edition of the Ency. Brit. (art. Diffusion). The fundamental importance of the doctrine of dissipation of energy for the theory of chemical reaction had already been insisted on in general terms by Rayleigh; subsequent to, but independently of, Gibbs's work it had been elaborated by von Helmholtz (Gesamm. Abhandl. ii. and iii.) in connexion with the thermodynamics of voltaic cells, and more particularly in the calculation of the free or available energy of solutions from data of vapour-pressure, with a view to the application to the theory of concentration cells, therein also coming close to the doctrine of osmotic pressure. This form of the general theory has here been traced back substantially to Lord Kelvin under date 1855. Expositions and developments on various lines will be found in papers by Riecke and by Planck in
ENERGICI—ENERGY

Annalen der Physik zwischen 1890 and 1900, in the course of a memoir by Larmor, Phil. Trans., 1897, A, in Voigt's Compendium der Physik, and his more recent Thermodynamik, in Planck's Vorlesungen über Thermodynamik, in Duhem's elaborate Traité de mécanique chimique et Le Potential thermodynamique, in Whetham's Theory of Solution and in Bryan's Thermodynamics. Numerous applications to special problems are expounded in "H. Holff's Lectures on Theoretical and Physical Chemistry."

The theory of energetics, which puts a diminishing limit on the amount of energy available for mechanical purposes, is closely implicated in the discovery of natural radioactive substances by H. Becquerel, and their isolation in the very potent form of radium salts by M. and Mme Curie. The slow degradation of radium has been found by the latter to be concomitant with an evolution of heat, in amount enormous compared with other chemical changes. This heat has been shown by E. Rutherford to be about what must be due to the stoppage of the a and b particles, which are emitted from the substance with velocities almost of the same scale as that of light. If they struck an ideal rigid target, their lost kinetic energy must all be sent away as radiation; but when they become entangled among the molecules of actual matter, it will, to a large extent, be shared among them as heat, with availability reduced accordingly. In any case the particles that escape into the surrounding space are so few and their velocity so uniform that we can, to some extent, treat their energy as directly available mechanically, in contradistinction to the energy of individual molecules of a gas (cf. Maxwell's "demons"), e.g. for driving a vane, as in Crookes's experiment with the cathode rays. Indeed, on account of the high velocity of projection of the particles from a radium salt, the actions concerned would find their equilibrium at such enormously high temperatures that any influence of actually available differences of temperature is not sensibly a feature of the phenomena. Such actions, however, like explosive actions in general, are beyond our powers of actual direct measurement as regards the degradation of availability of the energy. It has been pointed out by Rutherford, R. J. Strutt and others, that the energy of degradation of even a very minute admixture of active radium would entirely dominate and mask all other cosmical modes of transformation of energy; for example, it far outweighs that arising from the exhaustion of gravitational energy, which has been shown by Helmholtz and Kelvin to be an ample source for all the activities of our cosmical system, and to be itself far greater than the energy of any ordinary chemical rearrangements consequent on a fall of temperature: a circumstance that makes the existence and properties of this substance under settled cosmical conditions still more anomalous (see RADIOACTIVITY).

Theoretically it is possible to obtain unlimited concentration of available energy at the expense of an equivalent amount of degradation spread over a wider field; the potency of electric furnaces, which have recently opened up a new department of chemistry, and are limited only by the refractoriness of the materials of which they are constituted, forms a case in point. In radium we have the very remarkable phenomenon of far higher concentration occurring naturally in very minute permanent amounts, so that merely chemical sifting is needed to produce its aggregation. Even in pitchblende only one molecule in 10⁶ seems to be of radium, renewable, however, when lost, by internal transformation.

The energetics of Radiation is treated under that heading. See also THERMODYNAMICS.

ENERGICI, or ENERGUMENS (Gr. "possessed by a spirit"), the name given in the early Church to those suffering from different mental and physical symptoms, who were popularly supposed to be under the control of some indwelling spirit other than their own. Among primitive races everywhere disease is explained in this way, and its removal supposed to be effected by priestly prayers and incantations. They were sometimes called ΞΕΡΣΑΣΘΕΝΟΙ, as being "tossed by the waves" of uncontrollable impulse. Persons afflicted in this way were restricted from entering the church, but might share the shelter of the porch with lepers and persons of offensive life (Heile, Consiliengeschichte, vol. I. § 16).

After the prayers, if quiet, they might come in to receive the bishop's blessing (Apost. Const. VIII. 6, 7, 32) and listen to the sermon. They were daily fed and prayed over by the exorcists, and, in case of recovery, after a fast of from 20 to 40 days, were admitted to the eucharist, and their names and cures entered in the church records.

ENERGY (from the Gr. ἐνέργεια; ὑν, in, ἐνέργον, work), in physical science, a term which may be defined as accumulated mechanical work, which, however, may be only partially available for use. A bent spring possesses energy, for it is capable of doing work in returning to its natural form; a charge of gunpowder possesses energy, for it is capable of doing work in exploding; a Leyden jar charged with electricity possesses energy, for it is capable of doing work in being discharged. The motions of bodies, or of the ultimate parts of bodies, also involve energy, for stopping them would be a source of work.

All kinds of energy are ultimately measured in terms of work. If we raise 1 lb of matter through a foot we do a certain amount of work against the earth's attraction; if we raise 2 lb through the same height we do twice this amount of work, and so on. Also, the work done in raising 1 lb through 2 ft will be double of that done in raising it 1 ft. Thus we recognize that the work done varies as the resistance overcome and the distance through which it is overcome conjointly.

Now, we may select any definite quantity of work we please as our unit, as, for example, the work done in lifting a pound a foot high from the sea-level in the latitude of London, which is the unit of work generally adopted by British engineers, and is called the "foot-pound." The most appropriate unit for scientific purposes is one which depends only on the fundamental units of length, mass and time, and is hence called an absolute unit. Such a unit is independent of gravity or of any other quantity which varies with the locality. Taking the centimetre, gramme and second as our fundamental units, the most convenient unit of force is that which, acting on a gramme for a second, produces in it a velocity of a centimetre per second; this is called a Dyne. The unit of work is that which is required to overcome a resistance of a dyne over a centimetre, and is called an Erg. In the latitude of Paris the dyne is equal to the weight of about 9 3/4 of a gramme, and the erg is the amount of work required to raise 9 3/4 of a gramme vertically through one centimetre.

Energy is the capacity for doing work. The unit of energy should therefore be the same as that of work, and the centimetre-gramme-second (C.G.S.) unit of energy is the erg.

The forms of energy which are most readily recognized are of course those in which the energy can be most directly employed in doing mechanical work; and it is manifest that masses of matter which are large enough to be seen and handled are more readily dealt with mechanically than are smaller masses. Hence when useful work can be obtained from a system by simply connecting visible portions of it by a train of mechanism, such energy is more readily recognized than is that which would compel us to control the behaviour of molecules before we could transform it into useful work. This leads up to the fundamental distinction, introduced by Lord Kelvin, between "available energy," which we can turn to mechanical effect, and "dissipative energy," which is useless for that purpose.

The conception of what energy was originally derived from the observation of purely mechanical phenomena, that is to say, phenomena in which the relative positions and motions of visible portions of matter were all that were taken into consideration. Hence it is not surprising that, in those more subtle forms in which energy cannot be readily or completely converted into work, the universality of the principle of energy, its conservation, as regards amount, should for a long while have escaped recognition after it had become familiar in pure dynamics.

If a pound weight be suspended by a string passing over
pulley, in descending through 10 ft, it is capable of raising nearly a pound weight attached to the other end of the string, through the same height, and thus can do nearly 10 foot-pounds of work. The smoother we make the pulley the more nearly does the amount of useful work which the weight is capable of doing approach 10 foot-pounds, and if we take into account the work done against the friction of the pulley, we may say that the work done by the descending weight is 10 foot-pounds, and hence when the weight is in its elevated position we have at disposal 10 foot-pounds more energy than when it is in the lower position. It should be noticed, however, that this energy is possessed by the system consisting of the earth and pound together, in virtue of their separation, and that neither could do work without the other to attract it. The system consisting of the earth and the pound therefore possesses an amount of energy which depends on the relative positions of its two parts, on account of the latent physical connexion existing between them. In most mechanical systems the working stresses acting between the parts can be determined when the relative positions of all the parts are known; and the energy which a system possesses in virtue of the relative positions of its parts, or its configuration, is classified as "potential energy," to distinguish it from the energy of motion which we shall presently consider. The word potential does not imply that this energy is not real; it exists in potentiality only in the sense that it is stored away in some latent manner; but it can be drawn upon without limit for mechanical work.

It is a fundamental result in dynamics that, if a body be projected vertically upwards in vacuo, with a velocity of \( v \) centimetres per second, it will rise to a height of \( \frac{v^2}{2g} \) centimetres, where \( g \) represents the numerical value of the acceleration produced by gravity in centimetre-second units. Now, if \( m \) represent the mass of the body in grammes its weight will be \( mg \) dynes, for it will require a force of \( mg \) dynes to produce in it the acceleration denoted by \( g \). Hence the work done in raising the mass will be represented by \( mg \cdot \frac{v^2}{2g} \), that is, \( \frac{1}{2}mv^2 \) ergs. Now, whatever be the direction in which a body is moving, a frictionless constraint, like a string attached to the body, can cause its velocity to be changed into the vertical direction without any change taking place in the magnitude of the velocity. Thus it is merely in virtue of the velocity that the mass is capable of rising against the resistance of gravity, and hence we recognize that on account of its motion the body possessed \( \frac{1}{2}mv^2 \) units of energy. Energy of motion is usually called "kinetic energy."

A simple example of the transformation of kinetic energy into potential energy, and vice versa, is afforded by the pendulum. When at the limits of its swing, the pendulum is for an instant at rest, and all the energy of the oscillation is static or potential. When passing through its position of equilibrium, since gravity can do no more work upon it without changing its fixed point of support, all the energy of oscillation is kinetic. At intermediate positions the energy is partly kinetic and partly potential.

Available kinetic energy is possessed by a system of two or more bodies in virtue of the relative motion of its parts. Since our conception of velocity is essentially relative, it is plain that any property possessed by a body in virtue of its motion can be effectively possessed by it only in relation to those bodies with respect to which it moves. If a body, moving with velocity \( v \) grammes be moving with a velocity of \( v \) centimetres per second, relative to the earth, the available kinetic energy possessed by the system is \( \frac{1}{2}mv^2 \) ergs if \( m \) be small relative to the earth. But if we consider two bodies each of mass \( m \) and one of them moving with velocity \( v \) relative to the other, only \( \frac{1}{2}mv^2 \) units of work is available from this system alone. Thus the estimation of kinetic energy is intimately affected by the choice of our base of measurement.

When the stresses acting between the parts of a system depend only on the relative positions of those parts, the sum of the kinetic energy and potential energy of the system is always the same, provided the system be not actuated by anything outside it. Such a system is called "conservative," and is well illustrated by the swinging pendulum above referred to. But there are stresses which depend on the relative motion of the visible bodies between which they appear to act. When work is done against these forces no full equivalent of potential energy may be produced; this applies especially to frictional forces, for if the motion of the system be reversed the forces will be also reversed and will still oppose the motion. It was long believed that work done against such forces was lost, and it was not till the 19th century that the energy thus transformed was traced; the conservation of energy has become the master-key to unlock the connexions in inanimate nature.

It was pointed out by Thomson (Lord Kelvin) and P. G. Tait that Newton had divined the principle of the conservation of energy, so far as it belongs purely to mechanics. But what became of the work done against friction and such non-conservative forces remained obscure, while the chemical doctrine that heat was an indestructible substance afterwards led to the idea that it was lost. There was, however, even before Newton's time, more than a suspicion that heat was a form of energy. Francis Bacon expressed his conviction that heat consists of a kind of motion or "brisk agitation" of the particles of matter. In the Novum Organum, after giving a long list of the sources of heat, he says: "From these examples, taken collectively as well as singularly, it is clear that heat appears to be motion of the parts. It must not be thought that heat is merely the velocity or motion (though in some respects this is true), but the very essence of heat, or the substantial self of heat, is motion and nothing else."

After Newton's time the first vigorous effort to restore the universality of the doctrine of energy was made by Benjamin Thompson, Count Rumford, and was published in the Phil. Trans. for 1798. Rumford was engaged in superintending the boring of cannon in the military arsenal at Munich, and was struck by the amount of heat produced by the action of the boring bar upon the brass castings. In order to see whether the heat came out of the chips he compared the capacity for heat of the chips abraded by the boring bar with that of an equal quantity of the metal cut from the block by a fine saw, and obtained the same result in the two cases, from which he concluded that "the heat produced could not possibly have been furnished at the expense of the latent heat of the metallic chips.

Rumford then turned up a hollow cylinder which was cast in one piece with a brass six-pounder, and having reduced the connexion between the cylinder and cannon to a narrow neck of metal, he caused a blunt borer to press against the hollow of the cylinder with a force equal to the weight of about 10,000 lb, while the casting was made to rotate in a lathe. By this means the mean temperature of the brass was raised through about 70° Fahn., while the amount of metal abraded was only 837 grains.

In order to be sure that the heat was not due to the action of the air upon the newly exposed metallic surface, the cylinder and the end of the boring bar were immersed in 18-77 lb. of water contained in an oak box. The temperature of the water at the commencement of the experiment was 60° Fahr., and after two hours had turned the lathe for 24 hours the water boiled. Taking into account the heat absorbed by the box and the metal, Rumford calculated that the heat developed was sufficient to raise 26-28 lb of water from the freezing to the boiling point, and in this calculation he lost by radiation and conduction was neglected. Since Rumford was capable of doing the work required, Rumford remarked that one horse can generate heat as rapidly as nine wax candles burning in the ordinary manner.

Finally, Rumford reviewed all the sources from which the heat might have been supposed to be derived, and concluded that it was simply produced by the friction, and that the supply was inexhaustible. "It is hardly necessary to add," he remarks, "that anything which any insulated body or system of bodies can continue to furnish without limitation cannot possibly be a material substance; and it appears to me to be extremely difficult, if not quite impossible, to form any distinct idea of anything capable of being excited and communicated in the manner that heat was excited and communicated in these experiments, except it be motion."

About the same time Davy showed that two pieces of ice could be melted by rubbing them together in a vacuum, although
The various Royal methods have been supplanted by the ice, for ice absorbs heat in melting, this experiment afforded conclusive proof against the substantial nature of heat.

Though we may allow that the results obtained by Rumford and Davy demonstrate satisfactorily that heat is in some way due to motion, yet they do not tell us to what particular dynamical quantity heat corresponds. For example, does the heat generated by friction vary as the friction and the time during which it acts, or is it proportional to the friction and the distance through which the rubbing bodies are displaced—that is, to the work done against friction—or does it involve any other conditions? If it can be shown, however, and all other conditions of the experiment may be varied, the same amount of heat can in the end be always produced when the same amount of energy is expended, then, and only then, can we infer that heat is a form of energy, and that the energy consumed has been really transformed into heat. This was left for J. P. Joule to achieve; his experiments conclusively prove that heat and energy are of the same nature, and that all other forms of energy can be transformed into an equivalent amount of heat.

The quantity of energy which, if entirely converted into heat, is capable of raising the temperature of the unit mass of water from 0° C. to 1° C. is called the mechanical equivalent of heat. One of the first who took in hand the determination of the mechanical equivalent of heat was Marc Séguin, a nephew of J. M. Montgolfier. He argued that, if heat be energy, then, when it is employed in doing work, as in a steam-engine, some of the heat must itself be consumed in the operation. Hence he inferred that the amount of heat given up to the condenser of an engine when the engine is doing work must be less than when the same amount of steam is blown through the engine without doing any work. Séguin was unable to verify this experimentally, but in 1856 G. A. His succeeded, not only in showing that such a difference exists, but in measuring it, to a tolerably approximate value of the mechanical equivalent of heat. In 1859 Séguin endeavoured to determine the mechanical equivalent of heat from the loss of heat suffered by steam in expanding, assuming that the whole of the heat so lost was consumed in doing external work against the pressure to which the steam was exposed. This assumption, however, cannot be justified, because it is neglected to take account of work which might possibly have to be done within the steam itself during the expansion.

In 1842 R. Mayer, a physician at Heilbronn, published an attempt to determine the mechanical equivalent of heat from the heat produced when air is compressed. Mayer made an assumption the converse of that of Séguin, asserting that the whole of the work done in compressing the air was converted into heat, and neglecting the possibility of heat being consumed in doing work within the air itself or being produced by the transformation of internal potential energy. Joule afterwards proved (see below) that Mayer's assumption in this case was a sound one as far as experiment was concerned; and it was only on account of the values of the specific heats of air at constant pressure and at constant volume employed by him being inexact that the value of the mechanical equivalent of heat obtained by Mayer was very far from the truth.

Passing over L. A. Colding, who in 1843 presented to the Royal Society of Copenhagen a paper entitled "Theses concerning Force," which clearly stated the "principle of the perpetuity of energy," and who also performed a series of experiments for the purpose of determining the heat developed by the compression of various bodies, which entitle him to be mentioned among the founders of the modern theory of energy, we come to Dr James Prescott Joule of Manchester, to whom we are indebted more than to any other for the establishment of the principle of the conservation of energy on the broad basis on which it has since stood. The principal experiment of Joule's was that in which a brass paddle consisting of eight arms rotated in a cylindrical vessel of water containing four fixed vanes, which allowed the passage of the arms of the paddle but prevented the water from rotating as a whole. The paddle was driven by weights, and the temperature of the water was observed by thermometers which could indicate 0.006 of a degree Fahrenheit. Special experiments were made to determine the work done against resistances outside the vessel of water, which amounted to about 0.006 of the whole, and corrections were made for the loss of heat by radiation, the buoyancy of the air affecting the descending weights, and the energy dissipated when the weights struck the floor with a finite velocity. From these experiments Joule obtained 72.609 foot-pounds in the latitude of Manchester as equivalent to the amount of heat required to raise 1 lb of water through 1° Fahr, from the freezing point. Adopting the centigrade scale, this gives 1390-846 foot-pounds.

With an apparatus similar to the above, but smaller, made of iron and filled with mercury, Joule obtained results varying from 772-814 foot-pounds when driving weights of about 58 lb were employed to 775-332 foot-pounds when the driving weights were only about 10.4 lb. By causing two conical surfaces of cast-iron immersed in mercury and contained in an iron vessel to rub against one another when pressed together by a lever, Joule obtained 776-045 foot-pounds for the mechanical equivalent of heat when the heavy weights were used, and 774-93 foot-pounds with the small driving weights. In this experiment a great noise was produced, corresponding to a loss of energy, and Joule endeavoured to determine the amount of energy necessary to produce an equal amount of sound from the string of a violin cello and to apply a corresponding correction.

The close agreement between the results at least indicates that "the amount of heat produced by friction is proportional to the work done and independent of the nature of the rubbing surfaces." Joule inferred from them that the mechanical equivalent of heat is probably about 772 foot-pounds, or, employing the centigrade scale, about 1390 foot-pounds.

Previous to determining the mechanical equivalent of heat by the most accurate experimental method at his command, Joule established a series of cases in which the production of one kind of energy was accompanied by a disappearance of some other kind. In 1840 he showed that when an electric current was produced by means of a dynamo-magneto-electric machine the heat generated in the conductor, when no external work was done by the current, was the same as if the energy employed in producing the current had been converted into heat by friction, thus showing that electric currents conform to the principle of the conservation of energy, since energy can neither be created nor destroyed by them. He also determined a roughly approximate value for the mechanical equivalent of heat from the results of these experiments. Extending his investigations to the currents produced by batteries, he found that the total voltaic heat generated in any circuit was proportional to the number of electrochemical equivalents electrolysed in each cell multiplied by the electromotive force of the battery. Now, we know that the number of electrochemical equivalents electrolysed is proportional to the whole amount of electricity which passed through the circuit, and the product of this by the electromotive force of the battery is the work done by the latter, or, that in this case also Joule showed that the heat generated was proportional to the work done.

In 1844 and 1845 Joule published a series of researches on the compression and expansion of air. A metal vessel was placed in a calorimeter and air forced into it, the amount of energy expended in compressing the air being measured. Assuming that the whole of the energy was converted into heat, when the air was subjected to a pressure of 21.5 atmospheres Joule obtained for the mechanical equivalent of heat about 824-8 foot-pounds, and when a pressure of only 10.5 atmospheres was employed the result was 706-9 foot-pounds.

In the next experiment the air was compressed as before, and then allowed to escape through a long lead tube immersed in the water of a calorimeter, and finally collected in a bell jar. The amount of heat absorbed by the air could thus be measured, while the work done by it in expanding could be readily calculated. In allowing the air to expand from a pressure of 21 atmospheres
to that of the atmosphere the value of the mechanical equivalent of heat obtained was 821.6 foot-pounds. Between 10 atmospheres and 1 it was 815.05 foot-pounds, and between 23 and 14 atmospheres 61.74 foot-pounds.

But, unlike Mayer and Séguin, Joule was not content with assuming that when air is compressed or allowed to expand the heat generated or absorbed is the equivalent of the work done and of that only, no change being made in the internal energy of the air itself when the temperature is kept constant. To test this two vessels similar to that used in the last experiment were placed in the same calorimeter and connected by a tube with a stop-cock. One contained air at a pressure of 22 atmospheres, while the other was exhausted. On opening the stop-cock no work was done by the expanding air against external forces, since it expanded into a vacuum, and it was found that no heat was generated or absorbed. This showed that Mayer's assumption was true. On repeating the experiment when the two vessels were placed in different calorimeters, it was found that heat was absorbed by the vessel containing the compressed air, while an equal quantity of heat was produced in the calorimeter containing the exhausted vessel. The heat absorbed was consumed in giving motion to the issuing stream of air, and was reproduced by the impact of the particles on the sides of the vessel and by internal work.

The discussion between Mayer and Clapeyron, Dulong and Thomson, and Lord Kelvin (Phil. Trans., 1859, p. 357, 1854, p. 521, and 1862, p. 579) showed that the statement that no internal work is done when a gas expands or contracts is not quite true, but the amount is very small in the cases of those gases which, like hydrogen and nitrogen, can only be liquefied by intense cold and pressure.

For a long time the final result deduced by Joule by these varied and careful investigations was accepted as the standard value of the mechanical equivalent of heat. Recent determinations by H. A. Rowland and others, necessitated by modern requirements, have shown that it is in error, but by less than 1%.

The writings of Joule, which took the place of honour in the practical establishment of the conservation of energy, have been collected into two volumes published by the Physical Society of London. On the theoretical side the greatest stimulus came from the publication in 1847, without knowledge of Mayer or Joule, of Helmholz's great memoir, Uber die Erhaltung der Kraft, followed immediately (1848-1852) by the establishment of the science of thermodynamics (q.v.), mainly by R. Clausius and Lord Kelvin on the basis of "Carnot's principle" (1824), modified in expression so as to be consistent with the conservation of energy (see ENERGETICS).

Though we can convert the whole of the energy possessed by any mechanical system into heat, it is not in our power to perform the inverse operation, and to utilize the whole of the heat in doing mechanical work. Thus we see that different forms of energy are not equally valuable for conversion into work. The ratio of the portion of the energy of a system which can under given conditions be converted into mechanical work to the whole amount of energy operated upon may be called the "availability" of the energy. If a system be removed from all communication with anything outside of itself, the whole amount of energy possessed by it will remain constant, but will of its own accord tend to undergo such transformations as will diminish its availability. This general law, known as the principle of the "dissipation of energy," was first adequately pointed out by Lord Kelvin in 1857; and was applied by him to some of the principal problems of cosmical physics. Though controlling all phenomena of which we have any experience, the principle of the dissipation of energy is founded on no other and differing foundation from that of the conservation of energy; for while we may conceive of means of circumventing the latter principle, it seems that the actions of intelligent beings are subject to the former only in consequence of the rudeness of the machinery which they have at their disposal for controlling the behaviour of those ultimate portions of matter, in virtue of the motions or positions of which the energy with which they have to deal exists. If we have a weight capable of falling through a certain distance, we can employ the mutual forces of the system consisting of the earth and weight to do an amount of useful work which is less than the full amount of potential energy possessed by the system only in consequence of the friction of the constraints, so that the limit of availability in this case is determined only by the friction which is unavoidable. Here we have to deal with a transformation which we can grapple, and which can be controlled for our purposes. If, on the other hand, we have to deal with a system of molecules of whose motions in the aggregate we become conscious only by indirect means, while we know absolutely nothing either of the motions or positions of any individual molecule, it is obvious that we cannot grasp single molecules and control their movements so as to derive the full amount of work from the system. All we can do in such cases is to place the system under certain conditions of transformation, and be content with the amount of work which it is, as it were, willing to render up under those conditions. Thus the principle of Carnot involves the conclusion that a greater proportion of the heat possessed by a body at a high temperature can be converted into work than in the case of an equal quantity of heat possessed by a body at a low temperature, so that the availability of heat increases with the temperature.

 Clerk Maxwell supposed two compartments, A and B, to be filled with gas at the same temperature, and to be separated by an ideal, infinitely thin partition, which, during the expansion, can be placed to come in contact with a vessel containing a mass of cold. The presence of this partition, which, during the expansion, can be placed to come in contact with a vessel containing a mass of cold.

In 1875 Lord Rayleigh published an investigation on "the work which may be gained during the mixing of gases." In the preface he states the position that "whenver, then, two gases are allowed to mix without the performance of work, there is dissipation of energy, and an opportunity of doing work at the expense of low temperature heat has been for ever lost." He shows that the amount of work obtainable is equal to that which can be done by the first gas in expanding into the space occupied by the second (supposed vacuous) together with that done by the second in expanding into the space occupied by the first. In the experiment imagined by Lord Rayleigh a porous diaphragm takes the place of the partition and trap-doors imagined by Clerk Maxwell, and the molecules sort themselves automatically on account of the difference in their average velocities for the two gases. When the pressure on one side of the diaphragm thus becomes greater than that on the other, the contained gas may be used at the expense of heat by pushing the diaphragm, and the operation carried on with continual gain of work until the gases are uniformly diffused. There is this difference, however, between this experiment and the operation imagined by Maxwell, that when the gases have diffused the experiment cannot be repeated; and it is no more contrary to the dissipation of energy than is the fact that work may be derived at the expense of heat when a gas expands into a vacuum, for the working substance is not finally restored to its original condition; while Maxwell's "demons" may operate without limit.
ENFANTIN

In such experiments the molecular energy of a gas is converted into work only in virtue of the molecules being separated into classes in which their velocities are different, and these classes then allowed to act upon one another through the intervention of a suitable heat-engine. This sorting can occur spontaneously to a limited extent; while if we could carry it out as far as we pleased we might transform the whole of the heat of a body into work. The theoretical availability of heat is limited only by our power of bringing those particles whose motions constitute heat in bodies to rest relatively to one another; and we have precisely similar practical limits to the availability of the energy due to the motion of visible and tangible bodies, though theoretically we can then trace all the stages.

If a battery of electromotive force \( E \) maintain a current \( C \) in a conductor, and no other electromotive force exist in the circuit, the whole of the work done will be converted into heat, and the amount of work done per second will be \( EC \). If \( R \) denote the resistance of the whole circuit, \( E = CR \), and the heat generated per second is \( CR \). If the current drive an electromagnetic engine, the reaction of the engine will produce an electromotive force opposing the current. Suppose the current to be thus reduced to \( C' \). Then the work done by the battery per second will be \( EC' \) or \( CC'R \), while the heat generated per second will be \( CR \), so that we have the difference \( (C-C')CR \) for the energy consumed in driving the engine. The ratio of this to the whole work done by the battery is \( (C-C')C/CR \), so that the efficiency is increased by diminishing \( C' \). If we could drive the engine so fast as to reduce \( C' \) to zero, the whole of the energy of the battery would be available, no heat being produced in the wires, but the horse-power of the engine would be indefinitely small. The reason why the whole of the energy of the current is not available is that heat must always be generated in a wire in which a finite current is flowing, so that, in the case of a battery in which the whole of the energy of chemical affinity is employed in producing a current, the availability of the energy is limited only on account of the resistance of the conductors, and may be increased by diminishing this resistance. The availability of the energy of electrical separation in a charged Leyden jar is also limited only by the resistance of conductors, in virtue of which an amount of heat is necessarily produced, which is greater the less the time occupied in discharging the jar. The availability of the energy of magnetization is limited by the coercive force of the magnetized material, in virtue of which any change in the intensity of magnetization is accompanied by the production of heat.

In all cases there is a general tendency for other forms of energy to be transformed into heat on account of the friction of rough surfaces, the resistance of conductors, or similar causes, and thus to lose availability. In some cases, as when heat is converted into the kinetic energy of moving machinery or the potential energy of raised weights, there is an ascent of energy from the less available form of heat to the more available form of mechanical energy, but in all cases this is accompanied by the transfer of other heat from a body at a high temperature to one at a lower temperature, thus losing availability to an extent that more than compensates for the rise.

It is practically important to consider the rate at which energy may be transformed into useful work, or the horse-power of the agent. It generally happens that to obtain the greatest possible amount of work from a given supply of energy, and to obtain it at the greatest rate, are conflicting interests. We have seen that the efficiency of an electromagnetic engine is greatest when the current is indefinitely small, and then the rate at which it works is also indefinitely small. M. H. von Jacobi showed that for a given electromotive force in the battery the horse-power is greatest when the current is reduced to one-half of what it would be if the engine were at rest. A similar condition obtains in the steam-engine, in which a great rate of working necessities the dissipation of a large amount of energy.

(W. G.; J. L.)*

ENFANTIN, BARTHELEMY PROSPER (1796-1864), French social reformer, one of the founders of Saint-Simonism, was born at Paris on the 8th of February 1796. He was the son of a banker of Daunhiny, and after receiving his early education at a lyceum, was sent in 1813 to the École Polytechnique. In March 1814 he was one of the band of students who, on the heights of Montmartre and Saint-Chaumont, took an active part in the revolution against the armies of the allies then engaged in the investment of Paris. In consequence of this outbreak of patriotic enthusiasm, the school was soon closed by Louis XVIII., and the young student was compelled to seek some other career instead of that of the soldier. He first engaged himself to a country wine merchant, for whom he travelled in Germany, Russia and the Netherlands. In 1821 he entered a banking-house newly established at St Petersburg, but returned two years later to Paris, where he was appointed cashier to the Caisse Hypothécaire. At the same time he became a member of the secret society of the Carbonari. In 1825 a new turn was given to his thoughts and his life by the friendship which he formed with Olinde Rodrigue, who introduced him to Saint-Simon. He embraced the new doctrines with ardour, and by 1826 had become one of the acknowledged heads of the sect (see SAINT-Simon).

After the Revolution of 1830 Enfantin resigned his office of cashier, and devoted himself wholly to his cause. Besides contributing to the Globe newspaper, he made appeals to the people by systematic preaching, and organised centres of action in some of the principal cities of France. The headquarters in Paris were removed from the modest rooms in the Rue Taranne, and established in large halls near the Boulevard Italien. Enfantin and Bazard (q.v.) were proclaimed "Pères Suprêmes." This union of the supreme fathers, however, was only nominal. A divergence was already manifest, which rapidly increased to serious difference and dissension. Bazard had devoted himself to political reform, Enfantin to social and moral change; Bazard was organizer and governor, Enfantin was teacher and consoler; the former attracted reverence, the latter love. A hopeless antagonism arose between them, which was widened by Enfantin's announcement of his theory of the relation of man and woman, which would substitute for the "tyranny of marriage" a system of "free love." Bazard now separated from his colleague, and in his withdrawal was followed by all those who were attached to a philosophical and political Enfantin thus became sole "father," and the few who were chiefly attracted by his religious pretensions and aims still adhered to him. New converts joined them, and Enfantin assumed that his followers in France numbered 40,000. He wore on his breast a badge with his title of "Père," was spoken of by his preachers as "the living law," declared, and probably believed, himself to be the chosen of God, and sent out emissaries in a quest of a woman predestined to be the "female Messiah," and the mother of a new Saviour. The quest was very costly and altogether fruitless. No such woman was discoverable.

Meanwhile believers in Enfantin and his new religion were multiplying in all parts of Europe. His extravagances and success at length brought down upon him the hand of the law. Public morality was in peril, and in May 1832 the halls of the new sect were closed by the government, and the 'father,' with some of his followers, appeared before the tribunals. He was removed to a hotel at Meudonnont, near Paris, where with forty disciples, all of them men, he continued to carry out his socialist views. In August of the same year he was again arrested, and his appearance in court he desired his defence to be undertaken by two women who were with him, alleging that the matter was of special concern to women. This was of course refused. The trial occupied two days and resulted in a verdict of guilty, and a sentence of imprisonment for a year with a small fine.

This prosecution finally discredited the new society. Enfantin was released in a few months, and then, accompanied by some of his followers, he went to Egypt. He stayed there two years, and might have entered the service of the viceroy if he would have professed himself, as a few of his friends did, a Mahommadian. On his return to France, a saddler and practically a wiser man, he settled down to very prosaic work. He became first a postmaster near Lyons, and in 1841 was appointed, through the influence of some of his friends who had risen to posts of power, member of a scientific commission on Algeria, which led him to engage in researches concerning North Africa and colonization in general.

(Barthelemy Prosper Enfantin)
in 1845 he was appointed a director of the Paris & Lyons railway. Three years later he established, in conjunction with Duyfeyt, a daily journal, entitled Le Crédit, which was discontinued in 1850. He was afterwards attached to the administration of the railway from Lyons to the Mediterranean. Father Enfantin held fast by his ideal to the end, but he had renounced the hope of giving it a local habitation and a name in the degenerate obstinate world. His personal influence over those who associated with him was immense. "He was a man of a noble presence, with finely formed and expressive features. He was gentle and insinuating in manner, and possessed a calm, graceful and winning delivery" (Gent. Mag., Jan. 1865). His evident sincerity, his genuine enthusiasm, gave him his marvellous ascendancy. Not a few of his disciples ranked afterwards amongst the most distinguished men of France. He died suddenly at Paris on the 1st of September 1864.

Amongst his works are—Docttine de Saint-Simon (written in conjunction with several of his followers), published in 1830, and several times republished; Économie politique et politique Saint-Simoniennne (1831); Correspondance politique (1835–1840); Correspond. philos. et religieuse (1843–1845); and La Vie éternelle passée, présente, future (1861). A large number of articles by his hand appeared in Le Progrès des Arts, Le Monde, Le Journal de Paris, and several other papers of the period. He also wrote in 1832 Le Livre nouveau, intended as a substitute for the Christian Scriptures, but it was not published.

ENFIDAVILLE [Dar-el-Bey], a town of Tunisia, on the railway between Tunis and Susa, 33 m. N.E. of the last-named place and 5 m. W. of the Gulf of Hammamet. Enfidaville is the chief settlement on the Enfida estate, a property of over 300,000 acres in the Sahel district of Tunisia, forming a rectangle between the towns of Hammamet, Susa, Kairawan and Zaghwan. On this estate, devoted to the cultivation of cereals, olives, vines and to pasture, are colonies of Europeans and natives. At Enfidaville, where was, as its native name indicates, a palace of the bey's of Tunis, there is a large horse-breeding establishment and a much-frequented weekly market. About 5 m. N. of Enfidaville is Henshir Fraga (anc. Upponna), where are ruins of a large fortress and of a church in which were found mosaics with epitaphs of various bishops and martyrs.

The Enfida estate was granted by the bey Mahomed-es-Sadok to his chief minister Khaireddin Pasha (q.v.) in return for the confirmation by the sultan of Turkey in 1871, through the instrumentality of the pasha, of the right of succession to the beylik of members of Es-Sadok's family. When, some years later, Khaireddin left Tunisia for Constantinople he sold the estate to a Marseilles company, which resold it to the Société Française des Mines.

ENFIELD, a township of Hartford county, Connecticut, U.S.A., in the N. part of the state, on the E. bank of the Connecticut river, 20 m. N. of Hartford. It has an area of 35 sq. m., with three villages—Thompsonville, Hazardville and Enfield. Pop. (1800) 7199; (1810) 6699 (1812 foreign-born); (1910) 9719. Its principal manufactures are gunpowder, carpets, brick, cotton press machinery, and coffin hardware. In Enfield and its vicinity much tobacco is grown. First settled in 1679, Enfield was a part of the township of Springfield, Massachusetts, until 1683, when it was made a separate township; in 1749 it became a part of Connecticut. At a town meeting on the 11th of July 1774 it was resolved that "a firm and inviolable union of our colonies is absolutely necessary for the defence of our civil rights," and that "the most effectual measures to defeat the machinations of the enemies of His Majesty's government and the liberties of America is to break off all commercial intercourse with Great Britain and the West Indies until these oppressive acts for raising a revenue in America are repealed." A Shaker community was established in the township in 1781, at what is now called Shaker Station. See Enfield, N.H.

ENFIELD, a market town in the Enfield parliamentary division of Middlesex, England, 11 m. N. of London Bridge, on the Great Northern and Great Eastern railways. Pop. of urban district, (1891) 31,536, (1901) 42,758. It is picturesquely situated on the western slope of the Lea valley, with a consider-
whom 5420 were in the Upper Engadine and 683 in the Lower Engadine. In point of religion 8900 were Protestants (4723 in the Upper Engadine and 3677 in the Upper Engadine), and 3686 Romanists (1278 in the Upper Engadine and 1378 in the Lower Engadine), while there were 12 Jews in the Upper Engadine and 2 in the Lower Engadine: in the Upper Engadine the majority in each commune was Protestant (the Romanists strongest in St Moritz), as also in the case of the Lower Engadine, save Tarasp and Samnaun, where the Romanists prevail. In point of language 7600 inhabitants (5010 in the Lower Engadine and 2590 in the Upper Engadine) spoke the curious Ladin dialect (a survival of a primitive Romance tongue), and 2221 German (1265 in the Upper Engadine and 955 in the Lower Engadine). The capital of the Upper Engadine is Samaden (967 inhabitants), and that of the Lower Engadine, Schuls (1117 inhabitants). In 1908 there were no railways in the Engadine, save about 8 m. (from the mouth of the tunnel past Bevers and Samaden to St Moritz village) of the railway pierced (1865–1902) beneath (988 ft.) the Albul Pass (7595 ft.), which now affords the easiest means of access from Coire to St Moritz (56 m.); but many railways in and to the Engadine have been planned. The valley is reached by many passes (over which excellent carriage roads were constructed 1820–1872). The Maloja (5935 ft.) is the route from Chiavenna and the Lake of Como to the Upper Engadine, which is also reached from Coire by the Julier (7504 ft.) and the Albulas Passes (7595 ft.) as well as from Tirano in the Valtellina by the Bernina Pass (7645 ft.). On the other hand, the Lower Engadine is accessible from Davos over the Fluela Pass (7838 ft.) and from Maloja at the head of the Adige valley (or the Vintschgau) by the Ofen Pass (7071 ft.), while from Martinsbruck, the last Swiss village, a carriage road leads up to Nauders (5 m.), whence it is 27 m. by road down the Inn valley to Landeck on the Arlberg railway, or 12½ m. over the Reschen Scheideck Pass (4902 ft.) to Maloja in the Vintschgau.

The Upper Engadine consists of a long, straight, nearly level trough of 26 m., varying from a mile to half a mile in breadth, through which flows the Inn. On the south-east this trough is limited by the lofty glacier-clad Bernina group (culminating in the Piz Bernina, 13,042 ft.) and the range rising between the Inn valley and that of Livigno to the south-east, while on the northwest the boundary is the extensive Albul group (culminating in Piz Medel, 11,228 ft.). The Lower Engadine is far more picturesque and romantic than the Upper Engadine, the Inn valley being here much narrower and the fall greater. On its north-west rises the last bit of the Albul group (culminating in Piz Vadret, 10,584 ft.) and on the north the Silvretta group (culminating in Piz Lac de, 11,201 ft.), while to the east and south are the ranges either side of the Ofen Pass (culminating in Piz Sesvenna, 10,568 ft.). In the Upper Engadine the villages are on the floor of the valley, but in the Lower Engadine many are perched high above the bed of the river on terraces, and are cut off from each other by deep ravines.

The Upper Engadine is far better known to foreign visitors than the Lower Engadine, and is consequently much richer and more prosperous. The mineral waters of St Moritz (g. 690) are known throughout the 16th century, and long formed the great attraction of the region. But about the middle of the 17th century the Upper Engadine came into fashion as a great "air-cure," and now Maloja, Sils, Silvaplana, Camper and St Moritz are all well known; those who desire to explore the glaciers of the Bernina group mostly resort to Pontresina, on the Flatzbach, the stream descending from the Bernina Pass. Yet, owing to its great elevation, the scenery of the Upper Engadine has a bleak, northern aspect. Pines and larches alone flourish, garden vegetables are grown only in sunny spots, and there is no tillage. The Alpine flora is very rich and varied. But snow falls even in August, and the climate is well described in the proverb, "nine months winter, and three months cold weather." The villages are built entirely of stone (as also in the Lower Engadine), chiefly to guard against destructive fires that were formerly frequent in this narrow, wind-swept valley. The wealth of the inhabitants consists in their hay meadows and pastures. The lower pastures support large herds of cows, while the higher are let out (in both parts of the valley) to Bergamasque shepherds, who come thither every summer with their flocks. In the Lower Engadine the chief attraction is formed by the mineral springs at Schuls below Tarasp, which are much frequented during the summer. The wild gorge of Finstermünz separates the last Swiss village, Martinsbruck, from the first Tirolese village, Pfunds, the gorge being passable only on foot, while the carriage road makes a great detour by way of Nauders, so that the two villages are 13 m. by road from each other. The earliest full description of the country by an English traveller is that by Arden Colyn, in Travels in Switzerland (London, 1780).

The Upper Engadine is not mentioned in authentic documents till 1139, the bishop of Coire being then the great lord, and, from the 13th century, having as his bailiffs the family of Planta, the original seat of which was at Zuz. The valley obtained its freedom from both in 1486 (Planta) and in 1526, when the temporal powers of the bishop were abolished. In 1367 it (as well as the bishop's vassals in the Lower Engadine) joined the newly founded League of God's House or Gotteshausbund (see Grisons), one of the 7 Raetian Leagues, which lasted till 1799–1801, when the whole Engadine became part of Canton Raetia of the Helvetian Republic, which, in 1803, altered its name to that of Grisons or Graubünden, and then first entered the Swiss Confederation. In the Upper Engadine the "Referendum" existed as between the different villages composing a bailiwick (Hochgericht). The history of the Lower Engadine is for long quite different. Though always comprised in the diocese of Coire, it formed from the early 9th century onwards (with the Vintschgau) a separate county, which was gradually absorbed in that which, later, took the name of the county of Tirol. The limit between the Upper Engadine and the Tirolese Lower Engadine was definitively fixed in 1737 at the Punt Ota (the high bridge) just above Brail, and mentioned in 1139 already. In 1363 Tirol came into the possession of the Habsburgers, who were troublesome neighbours both to the Upper Engadine and to the League of God's House. Their power was stemmed in 1490 at the battle of the Calven gorge (above Mals), though it was only in 1652 that the Lower Engadine bought up the remaining rights of the Habsburgers. But the castle of Tarasp (acquired by them in 1464) was excepted: the lordship was given by them in 1687 to the Dietrichstein family, and held by it till 1801, when Austria ceded it to France, which, in 1803, handed it over to the Swiss Confederation, by which it was incorporated in 1809 with the Canton of the Grisons. This long connexion with Tyrol accounts for the fact that Tarasp is still mainly Romanist, while the lonely Swiss valley of Samnaun (above Martinsbruck) has given up its Protestantism and its Ladin speech owing to communications with Tirol being easier than with Switzerland. The bears in the bear pit at Bern come from the forests in the lower Spöl valley, above Zernez, in the Lower Engadine, on the way to the Ofen Pass. The upper valley (Livigno) is Italian (see Valtellina).

ENGEL—ENHGENI

repeating the columns of the peristyle, and in the theatres and amphitheatres, where they subdivided the arched openings in all these cases engaged columns are utilized as a decorative feature, and as a rule the same proportions are maintained as if they had been isolated columns. In Romanesque work the classic proportions are no longer adhered to; the engaged column, attached to the piers, has always a special function to perform, either to support subsidiary arches, or, raised to the vault, to carry its transverse or diagonal ribs. The same constructional object is followed in the earlier Gothic styles, in which they became merged into the mouldings. Being virtually always ready made, so far as their design is concerned, they were much affected by the Italian revivalists.

ENGEL, ERNST (1821–1896), German political economist and statistician, was born in Dresden on the 21st of March 1821. He studied at the famous mining academy of Freiberg, in Saxony, and on completing his curriculum travelled in Germany and France. Immediately after the 1848 revolution he was appointed to the royal commission in Saxony appointed to determine the relations between trade and labour. In 1850 he was directed by the government to assist in the organization of the German Industrial Exhibition of Leipzig (the first of its kind). The success which crowned his efforts was so great that in 1854 he was induced to enter the government service, as chief of the newly instituted statistical department. He retired, however, from the office in 1858. He founded in Dresden the first Mortgage Insurance Society (Hypotheken-Versicherungsgesellschaft), and as a result of the success of his work was summoned in 1860 to Berlin as director of the statistical department, in succession to Karl Friedrich Wilhelm Dietelrici (1790–1839). In his new office he made himself a name of world-wide reputation. Raised to the rank of Geheimer Regierungsrat, he retired in 1882 and lived henceforward in Kadebeul near Dresden, where he died on the 8th of December 1896. Engel was a voluminous writer on the subjects with which his name is connected, but his statistical works are mostly published in the periodicals in which he himself established, viz. Preuss. Statistik (in 1861); Zeitschrift des Statistischen Bundes, and Zeitschrift des Statistischen Bundes des Königreichs Sachsen.

ENGEL, JOHANN JAKOB (1741–1802), German author, was born at Parchim, in Mecklenburg, on the 11th of September 1741. He studied theology at Rostock and Bützow, and philosophy at Leipzig, where he took his doctor's degree. In 1776 he was appointed professor of moral philosophy and belles-lettres in the Joachimsthal gymnasium at Berlin, and a few years later he became tutor to the crown prince of Prussia, afterwards Frederick William III. The lessons which he gave his royal pupil in ethics and politics were published in 1798 under the title Fürstenspiegel, and are a favourable specimen of his powers as a popular philosophical writer. In 1787 he was admitted a member of the Academy of Sciences of Berlin, and in the same year he became director of the royal theatre, an office he resigned in 1794. He died on the 28th of June 1802.

Besides numerous dramas, some of which had a considerable success, Engel wrote several valuable books on aesthetic subjects. His Anfangsgründe einer Theorie der Dichtungskunst (1783) showed fine taste and acute critical faculty if it lacked imagination and poetic insight. The same excellences and the same defects were apparent in his Ideen zu einer Mimik (1785), written in the form of letters. His most popular work was Der Philosoph für die Welt (1773), which consists chiefly of dialogues on men and morals, written from the utilitarian standpoint of the philosophy of the day. His last work, a romance entitled Herr Lorenz Stark (1793), achieved a great success, by virtue of the marked individuality of its characters and its appeal to middle-class sentiment.

Engel's Sämtliche Schriften were published in 12 volumes at Berlin in 1801–1806: a new edition appeared at Frankfort in 1851. See Kehr, Johann Jakob Engel (Vorlesungen, 1897).

ENGELBERG, an Alpine village and valley in central Switzerland, much frequented by visitors in summer and to some extent in winter. It is 1,434 ft. by electric railway from Stansstad, on the Lake of Lucerne, past Stans. The village (3,343 ft.) is in a mountain basin, shut in on all sides by lofty mountains (the highest is the Titlis, 10,627 ft. in the south-east), so that it is often hot in summer. It communicates by the Surenen Pass (5,725 ft.) with Wassen, on the St Gotthard railway, and by the Joch Pass (5,725 ft.) past the favourite summer resort of the Engstlen Alp (6,034 ft.), with Meiringen in the Bernese Oberland. The village has clustered round the great Benedictine monastery which gives its name to the valley, from the legend that its site was fixed by angels, so that the spot was named "Mons Angelorum." The monastery was founded about 1120 and still survives, though the buildings date only from the early 18th century. Its library suffered much at the hands of the French in 1798. From 1462 onwards it was under the protectorate of Lucerne, Schwyz, Unterwalden and Uri. In 1798 the abbott lost all his temporal powers, and his domains were annexed to the Obwalden division of Unterwalden, but in 1803 were transferred to the Neuchâtel division. However, in 1816, in consequence of the desertion resistance made by the Neuchâtel men to the new Federal Pact of 1815, they were punished by the fresh transfer of the valley to Obwalden, part of which it still forms.

As the pastures forming the upper portion of the Engelberg valley have for ages belonged to Uri, the actual valley itself is politically isolated between Uri and Obwalden. The monastery is still directly dependent on the pope. In 1900 the valley had 1,737 inhabitants, practically all German-speaking and Romanists. (W. A. B.)

ENGELBRECHTSDATTER, DORTHE (1614–1716), Norwegian poet, was born at Bergen on the 16th of January 1614; her father, Engelbrecht Jorgensen, was originally rector of the high school in that city, and afterwards dean of the cathedral. In 1632 she married Ambrosius Hardenbeken, a theological writer famous for his flowery funeral sermons, whom she succeeded her father at the cathedral in 1659. They had five sons and four daughters. In 1678 her first volume appeared, Stjolands aandelige Sangogger ("The Soul's Spiritual Offering of Song") published at Copenhagen. This volume of hymns and devotional pieces, very modestly brought out, had an unparalleled success. The fortunate poetess was invited to Denmark, and on her arrival at Copenhagen was presented to Court. She was also introduced to Thomas Kingo, the father of Danish poetry, and the two met and married with improvised couplets, which have been preserved, and of which the poetess's reply is incomparably the neater. In 1688 her husband died, and before 1698 she had buried all her nine children. In the midst of her troubles appeared her second work, the Taureoffer ("Sacrifice of Tears"), which is a continuous religious poem in four books. This was combined with the Sangogger, and no fewer than three editions of the united works were published before her death, and many after it. In 1698 she brought out a third volume of sacred verse, Et kristeligt Valet fra Verden ("A Christian Farewell to the World"), a very tame production. She died on the 10th of February 1716. The first verses of Dorthe Engelbrechtsdatter are the best; her Sangogger was dedicated to Jesus, the Taureoffer to Queen Charlotte Amalia; this is significant of her changed position in the eyes of the world.

ENGELHARDT, JOHANN GEORG VETI (1791–1855), German theologian, was born in Neustadt-on-the-Zschopau on the 12th of November 1791, and was educated at Erlangen, where he afterwards taught in the gymnasium (1817), and became professor of theology in the university (1821). His two great works were a Handbuch der Kirchengeschichte in 4 vols. (1833–1834), and a Dogmengeschichte in 2 vols. (1839). He died at Erlangen on the 13th of September 1855.

ENGHENI, LOUIS ANTOINE HENRI DE BOURBON CONDÉ, Duc d' (1772–1834), was the only son of Henri Louis Joseph, prince of Condé, and of Louise Marie Thérèse Mathilde, sister of the duke of Orleans (Philippe Égalité), and was born at Chantilly on the 2nd of August 1772. He was educated privately by the abbé Millot, and received a military training from the comodore of Virieux. He early showed the warlike spirit of the house of Condé, and began his military career in 1788. On the outbreak of the French Revolution he "emigrated" with very many of the nobles a few days after the fall of the Bastille, and remained in exile, seeking to raise forces for the invasion of France and the
restoration of the old monarchy. In 1792, on the outbreak of war, he held a command in the force of émigrés (styled the "French royal army") which shared in the duke of Brunswick's unsuccessful invasion of France. He continued to serve under his father and grandfather in what was known as the Condé army, and on several occasions distinguished himself by his bravery and ardour in the vanguard.

On the dissolution of that force after the peace of Lunéville (February 1801) he married privately the princess Charlotte, niece of Cardinal de Rohan, and took up his residence at Ettenheim in Baden, near the Rhine. Early in the year 1804, Napoleon, then First Consul of France, heard news which seemed to connect the young duke with the Cadoudal-Pichegru conspiracy then being traced by the French police. The news ran that the duke was in company with Dumouriez and made secret journeys into France. This was false; the acquaintance was Thuméry, a harmless old man, and the duke had no dealings with Cadoudal or Pichegru. Napoleon gave orders for the seizure of the duke. French mounted gendarmes crossed the Rhine secretly, surrounded his house and brought him to Strassburg (15th of March 1804), and thence to the castle of Vincennes, near Paris. There a commission of French colonels was hastily gathered to try him. Meanwhile Napoleon had found out the true facts of the case, and the ground of the accusation was hastily changed. The duke was now brought chiefly with bearing arms against France in the late war, and with intending to take up arms. The new coalition then proposed against France. The colonel hastily and most informally drew up the act of condemnation, being incited thereto by orders from Savary (q.v.), who had come charged with instructions. Savary intervened to prevent all chance of an interview between the condemned and the First Consul; and the duke was shot in the moat of the castle, near a grave which had already been prepared. With him ended the house of Condé. In 1816 the bones were exhumed and placed in the chapel of the castle. It is now known that Josephine and Mme de Rémusat had begged Napoleon for mercy towards the duke; but nothing would bend his will. The blame which the apologists of the emperor have thrown on Talleyrand or Savary is undeserved. On his way to St. Helena and at Longwood he asserted that, in the same circumstances, he would do the same again; he inserted a similar declaration in his will.

ENGHEN, a town in the province of Hainaut, Belgium, lying south of Grammont. Pop. (1904) 4541. It is the centre of considerable lace, linen and cotton industries. There is a fine park outside the town belonging to the duke of Arenberg, whose ancestor, Charles de Ligne, bought it from Henry IV. in 1607, but the chateau in which the duke of Arenberg of the 18th century entertained Voltaire no longer exists. Curiously enough the cottage, a stone building, built by the same duke for Jean Jacques Rousseau, still stands in the park, while the ducal residence was burnt down by the sans-culottes. A fine pavilion or kiosk, named de l’Etoile, has also survived. The great Condé was given, for a victory gained near this place, the right to use the style of Enghien among his subsidiary titles.

ENGINE (Lat. ingenium), a term which in the time of Chaucer had the meaning of "natural talent" or "ability," corresponding to the Latin from which it is derived (ci. "A man hath sapience, or thie, Memorie, engin, and intellect also," Second New's Tale, 330); in sense it is now obsolete. It also denoted a mechanical tool or contrivance, and especially a weapon of war; this sense may be compared with that of ingenium in classical Latin to mean a clever idea or device, and in later Latin, as in Tertullian, for a warlike instrument or machine. In the 19th century it came to have, when employed alone, a specific reference to the steam-engine (q.v.), but it is also used of other prime movers such as the air-engine, gas-engine and oil-engine (q.v.).

ENGINEERING, a term for the action of the verb "to engineer," which in its early uses referred specially to the operations of those who constructed engines of war and executed works intended to serve military purposes. Such military engineers were long the only ones to whom the title was applied. But about the middle of the 18th century there began to arise a new class of engineers who concerned themselves with works which, though they might be in some cases, as in the making of roads, of the same character as those undertaken by military engineers, were neither exclusively military in purpose nor executed by soldiers, and those men by way of distinction came to be known as civil engineers. No better definition of their aims and functions can be given than that which is contained in the charter (dated 1828) of the Institution of Civil Engineers (London), where civil engineering is described as the "art of directing the great sources of power in nature for the use and convenience of man, as the means of production and of traffic in states, both for external and internal trade, as applied in the construction of roads, bridges, aqueducts, canals, river navigation and docks for internal intercourse and exchange, and in the construction of ports, harbours, moles, breakwaters and lighthouses, and in the art of navigation by artificial power for the purposes of commerce; and to the construction and adaptation of their works to the drainage of cities and towns." Wide as is this enumeration, the practice of a civil engineer in the earlier part of the 19th century might cover many or even most of the subjects it contains. But gradually specialization set in. Perhaps the first branch to be recognized as separate was mechanical engineering, which is concerned with steam-engines, machine tools, mill-work and moving machinery in general, and it was soon followed by mining engineering, which deals with the location and working of coal, ore and other minerals. Subsequently numerous other more or less strictly defined groups and subdivisions came into existence, such as naval architecture dealing with the design of ships, marine engineering with the engines for propelling steamers, sanitary engineering with water-supply and disposal of sewage and other refuse, gas engineering with the manufacture and distribution of illuminating gas, and chemical engineering with the design and erection of the plant required for the manufacture of such chemical products as alkali, acids and dyes, and for the working of a wide range of industrial processes. The last great new branch is electrical engineering, which relates to all the other branches at so many points; that it has been said that all engineers must be electricians.

ENGINEERS, MILITARY. From the earliest times engineers have been employed both in the field of war and on field defences. In modern times, however, the application of numerous scientific and engineering devices to warfare has resulted in the creation of many minor branches of military engineering, some of them almost rivalling in importance their primary duty of fortification and siegework, such as the field telegraph, the balloon service, nearly all demolitions, the building of pontoon and other bridges, and the construction and working of military roads, railways, piers, &c. All these branches requiring special knowledge, the modern tendency is to divide a corps of engineers in accordance with such requirements. The "field companies" and "fortress companies" of the R.E. represent the traditional tactical application of their arm to works of offence and defence in field and siege warfare. The balloon, telegraph, and other branches, also organized on a permanent footing, represent the modern application of scientific aids in warfare. (See also FORTIFICATION AND SIEGECRAFT; TACTICS; MILITARY ENGINEERING, &c.)

History. The division of labour between military and civil engineers in the earlier ages of modern history, for all engineers acted as builders of castles and defensible strongholds, as well as manufacturers and directors of engines of war with which to attack or defend them. The annals of fortification show professors, artists, &c., as well as soldiers and architects, as designers and builders of innumerable systems of fortification. By the middle of the 13th century there was in England an organized body of skilled workmen employed under a "chief engineer." At the siege of Calais in 1347 this corps consisted of masons, carpenters, smiths, tentmakers, miners, armourers,
gunners and artillerymen. At the siege of Harfleur in 1415 the chief engineer was designated Master of the King's Works, Guns, and Ordnance, and the corps under him numbered 500 men, including 21 foot-archers. Headquarters of engineers existed at the Tower of London before 1350, and a century later developed into the Office of Ordnance (afterwards the Board of Ordnance), whose duty was to administer all matters connected with fortifications, artillery and ordnance stores.

Henry VIII. employed many engineers (of whom Sir Richard Lee is the best known) in constructing coast defences from Penzance to the Thames and thence to Berwick-on-Tweed, and in strengthening the fortresses of Calais and Guines in France. He also added to the organization a body of pioneers under trenchmasters and a master trenchmaster. Charles II. increased the peace establishment of engineers and formed a separate one for Ireland, with a chief engineer who was also surveyor-general of the King's Works. In both countries only a small permanent establishment was maintained, a special ordnance train being enrolled in war-time for each expedition and disbanded on its termination. The commander of an ordnance train was frequently, but not necessarily, an engineer, but there was always a chief engineer of each train. At Blenheim (1704) Marlborough's ordnance train was commanded by Holcroft Blood, a distinguished engineer. But after the rebellion of 1715 it was decided to separate the artillery from the engineers, and the royal warrant of 26th May 1716 established two companies of artillery as a separate regiment, and an engineer corps composed of 1 chief engineer, 3 directors, 6 engineers-in-ordinary, 6 engineers extraordinary, 6 sub-engineers and 6 practitioner engineers.

Until the 14th of May 1757 officers of engineers frequently held, in addition to their military rank in the corps of engineers, commissions in foot regiments; but on and after that date all engineer officers were gazetted to army as well as engineer rank—the chief engineer as colonel of foot, directors as lieutenant-colonel, and so forth down to practitioners as ensigns. On the 18th of November 1782 engineer grades, except that of chief engineer, were abolished, and the establishment was fixed at 1 chief engineer and colonel, 6 colonels commandant, 6 lieutenants-colonels, 9 captains, 9 captain lieutenants (afterwards second captains), 22 first lieutenants, and 22 second lieutenants. Ten years later a small invalid corps was formed. In 1782 the designation "Royal" was conferred upon the engineers, and its precedence settled to be on the right of the army, with the royal artillery.

In 1802 the title of chief engineer was changed to inspector-general of fortifications. From this time to the conclusion of the Crimean War various augmentations took place, consequent on the increasing and widely extending duties thrown upon the officers. These, in addition to ordinary military duties, comprised the construction and maintenance of fortifications, barracks and ordnance store buildings, and all engineering services connected with them. The cadastral survey of the United Kingdom (called the "Ordnance Survey") had been entrusted to the engineers as far back as 1764, and absorbed many officers in its execution.

In 1776 the formation at Gibraltar of "The Company of Soliders Artificers" (formed by Royal Engineers) was authorized, and a separate company was added soon afterwards. In 1783, by royal warrant "The Corps of Royal Artificers" was established at home, consisting of six companies, with which the Gibraltar companies were amalgamated. In 1806 this corps was doubled, and in 1811 increased to 32 companies. In 1813 its title was changed to "The Royal Sappers and Miners." In 1836, at the close of the Crimean War, it was incorporated with "The Corps of Royal Engineers," by whom it had always been officered. At that date the corps numbered about 340 officers and 4000 non-commissioned officers and men, in 1 troop and 32 companies.

In 1770 the East India Company reorganized the engineer corps of the three presidencies, composed of officers only. Native corps of sappers or pioneers were formed later, and officered principally by engineers. The officers of engineers were employed in peace-time on the public works of the country, their services when required being placed at the disposal of the military authorities. The Indian Engineers have not only distinguished themselves in the operations of war, but have left monuments of engineering skill in the irrigation works, railways, surveys, roads, bridges, public buildings and defences of the country. When Indian administration was transferred to the crown (1862) the Indian Engineers became "Royal," so that there now exists but one corps, the Royal Engineers. This is composed of about 1000 officers and 7700 warrant and non-commissioned officers and men. Of the officers some 220 are attached to units, about 400 employed either at home or in the colonies on engineering duties in military commands, on the staff, or on special duty, and about 370 on the Indian establishment. The supreme technical control of the Royal Engineers is exercised from the War Office. See also UNITED KINGDOM; ARMY.

The history of the French engineers shows a somewhat similar line of development. Originally selected officers of infantry were given brevets as engineers, and these men performed military and also civil duties for the king's service by the aid of companies of workmen enlisted and discharged from time to time. Vauban (q.v.) was the founder of the famous corps de Génie (1690). Its members were selected officers and civilians, employed in all branches of military and naval services, and it soon achieved its European reputation as the first school of fortification and engineering. It received a special uniform in 1733. About 1755 it was for a time merged in the artillery. In 1766 the title of Génie was conferred upon the officers, and the same name (troupes de Génie) was given to the previously existing companies of sappers and miners in 1801.

In the United States the separate Corps of Engineers (since 1794 there had been a Corps of Artillliers and Engineers) was organized in 1802, starting with a small body stationed at West Point, which in 1838 and 1846 was gradually increased, and in 1861 given three additional companies. In 1866 they were formed into a battalion and stationed at Willets Point, N.Y. In 1901 they were reorganized in three battalions, with a total strength of 1282. The U.S. Engineer School, formerly at Willets Point, was transferred in 1901 to Washington. Until 1866 the military academy at West Point was under the supervision of the Corps of Engineers, but from that time its direction was thrown open; but the highest branch at West Point is still regarded as that of the engineers. The Corps of Engineers has done a great deal of highly important work in the United States, notably in building forts, and improving rivers and harbours for navigation.

ENGIS, a cave on the banks of the Meuse near Liège, Belgium, where in 1832 Dr P. C. Schmerling found human remains in deposits belonging to the Quaternary period. Bones of the cave-bear, mammoth, rhinoceros and hyena were discovered in association with parts of a man's skeleton and a human skull.

This, known as "the Engis Skull," gave rise to much discussion among anthropologists, since it has characteristics of both high and low development, the forehead, low and narrow, indicating slight intelligence, while the abnormally large brain cavity permits the inference of an over-average intelligence. Of it Huxley wrote: "There is no mark of degradation about any part of it. It is a fair average human skull, which might have belonged to a philosopher, or might have contained the thoughtless brains of a savage." Dr Schmerling concluded that the human remains were those of man who had been contemporary with the extinct mammals. As, however, fragments of coarse pottery were found in the cave which bore other evidence of having been used by neolithic man, by whom the cave-floor and its contents might have been disturbed and mixed, his arguments have not been received as conclusive. There is, however, no doubt as to the great age of the Engis Skull. Discoveries of a like nature were made by Dr Schmerling in the neighbourhood of Engis, Chokier and others.

See P. C. Schmerling, Recherches sur les ossements découverts dans les cavernes de la province Liège (1833); Huxley, Man's Place in Nature, p. 156; Lord Avebury, Prehistoric Times, p. 317 (1900).
ENGLAND. Geographical usage confines to the southern part of the island of Great Britain, the name commonly given to the great insular power of western Europe. In this respect the present article deals with England, the predominant partner in the United Kingdom of Great Britain and Ireland, both as containing the seat of government and in respect of extent, population and wealth.

1. Topography.

England extends from the mouth of the Tweed in 55° 46' N. to Lizard Point in 49° 57' 30" N., in a roughly triangular form. The base of the triangle runs from the South Foreland to Land's End. by S., a distance of 316 m. in a straight line, but 545 m. following the larger curves of the coast. The east coast runs N.N.W. from the South Foreland to Berwick, a distance of 348 m., or, following the coast, 640 m. The west coast runs N.E. from apart at the Lizard to 21 at Dover. The east coast faces the shallow North Sea, which widens from the point where it joins the channel to 375 m. off the mouth of the Tweed, the opposite shores being occupied in succession by France, Belgium, Holland, Germany and Denmark. The west coast faces the Irish Sea, with a width varying from 45 to 130 m.

The area of England and Wales is 37,327,479 acres or 58,324 sq. m. (England, 50,851 sq. m.), and the population on this area in 1901 was 32,577,843 (England, 30,807,232). The principal territorial divisions of England, as of Wales, Scotland and Ireland, are the counties, of which England comprises 40. Their boundaries are not as a rule determined by the physical features of the land; but localities are habitually defined by the use of their names. A list of the English counties (excluding Wales) is given in the table above.

Hills.—As an introduction to the discussion of the natural regions into which England is divided (Section II.), and for the sake of comparison of altitudes, size of rivers and similar details, the salient geographical features may be briefly summarized. The short land-frontier of England with Scotland (its length is only 100 m.) is in great measure a physical boundary, as considerable lengths of it are formed on the east side by the river Tweed, and on the west by Kershope Burn, Liddel Water, and the river Sark; while for the rest it follows pretty closely the summit of the Cheviot Hills, whose highest point is the Cheviot (2676 ft.). A narrow but well-marked pass or depression, known as the Tyne Gap, is taken to mark the Cheviot system from the Pennine Chain, which is properly to be described as a wide tract of hill-country, extending through two degrees of latitude, on an axis from N. by W. to S. by E. The highest point is Cross Fell (2930 ft.). On the north-west side of the Pennine system, marked off from it by the upper valleys of the rivers Eden and Lune, lies the circular hill-tract whose narrow valleys, radiating from its centre somewhat like wheel-spokes, contain the beautiful lakes which give it the celebrated name of the Lake District. In this tract is found the highest land in England, Scafell Pike reaching 3210 ft. East of the Pennines, isolated on three sides by lowlands and on the southside by the North Sea, lie the high moors of the North Riding of Yorkshire, with the Cleveland Hills, and, to the south, the Yorkshire Wolds of the East Riding. Neither of these systems has any great elevation; the moors, towards their north-western edge, reaching an extreme of 1489 ft. in Urra Moor. The tableland called the Peak of Derbyshire, in the south of the Pennine system, is 2088 ft. in extreme height, but south of this system an elevation of 2000 ft. is not found anywhere in England save at a few points on the south Welsh border and in Dartmoor, in the south-west. Wales, on the other hand, projecting into the western sea between Liverpool Bay and the estuary of the Dee on the north, and the Bristol Channel on the south, is practically all mountainous, and has in Snowden, in the north-west, a higher summit than any in England—3560 ft. But the midlands, the west, and the south of England, in spite of an absence of great elevation, contain no plains of such extent as might make for monotonous. The land, generally undulating, is further diversified with hills arranged in groups or ranges, a common characteristic of which is a bold face on the one hand and a long gentle slope, with narrow valleys deeply penetrating, on the other. Southward from the Pennines there may be mentioned, in the midlands, the small elevated tract of Charnwood Forest (Bardon Hill, 912 ft.) in Leicestershire, and Cannock Chase (775 ft.) and the Clent Hills (928 ft.), respectively north and south of the great manufacturing district of Birmingham and Wolverhampton. Of the western counties, the southern half of Shropshire, Herefordshire and Monmouthshire are generally hilly. Among the Shropshire Hills may be mentioned the isolated Wrekin (1335 ft.), Long Mynd (1674 ft.) and the Clee Hills (Brown Clee, 1805 ft.). The figures given here for the ancient or geographical counties, Section IX., on Territorial Divisions, indicates the departures from the ancient county boundaries made for certain purposes of administration. Each county is treated in a separate article in the topographical, geological, economical and historical aspects. Further topographical details are given in separate articles on the more important hill-systems, rivers, &c.
long ridge of the Black Mountain reaches an extreme height of 2310 ft. on the Welsh border of Herefordshire. The Malvern Hills on the extreme side of the county, which, owing to their almost isolated position among lowlands, appear a far more prominent feature, reach only 1395 ft. In western Monmouthshire, again belonging to the south Welsh system, there are such heights as Sugar Loaf (1555 ft.) and Coity (1095 ft.).

In the south midlands of England there are two main ranges of hills, with axes roughly parallel. The western range is the Cotteswold Hills of Gloucestershire and the counties adjacent on the east running S.W. and N.E. Its highest point is Cleeve Cloud (1134 ft.). The uplands of Northamptonshire continue this range north-eastward, decreasing in elevation. The eastern range, beginning in Wiltshire, runs E.N.E. as the White Horse Hills (856 ft. at the highest point), and after the interruption caused by the gap or narrow valley by which the river Thames penetrates the hills near Goring, continues N.E. as the Chiltern Hills (850 ft.). The East Anglian range continues the line E.N.E., gradually decreasing in altitude. In the south-east of England, the North and South Downs are both well-defined ranges, but are characterized by a number of breaches through which rivers penetrate, on the one hand to the Thames or the North Sea and on the other to the English Channel. Leith Hill in the North Downs reaches 965 ft., and Butter Hill in the South Downs 889 ft.; Blackdown and Hindhead, two almost isolated masses of high ground lying between the two ranges of the Downs towards their western extremity, are respectively 918 and 805 ft. in height. In the north of Hampshire along its boundary with Surrey and Berkshire, in the southern half of Wiltshire (where rises the upland of Salisbury Plain), in Dorsetshire, and the south of Somersetshire, the hills may be said to run in a series of connected groups. They cannot be defined as a single range, nor are they named, as a rule, according to the groups into which they fall, but the general title of the Western Downs is applied to them. One point only in all these groups exceeds 1000 ft. in altitude, namely, Inkpen Beacon (1091 ft.) in the south-east of Berkshire, in heights above 900 ft. are not infrequent. In the northern part of Somersetshire, two ranges, short but well defined, lie respectively east and west of a low plain which slopes to the Bristol Channel. These are the Mendips (Black Down, 1068 ft.) and the Quantocks (Will’s Neck, 1261 ft.). The Blackdown Hills, in south-western Somersetshire and eastern Devonshire, reach 1015 ft. in Staple Hill in the first-named county. In western Somersetshire and north Devonshire the elevated mass of Exmoor reaches 1709 ft. in Dunkery Beacon; and in south Devonshire the highest land in southern England is found in the similar mass of Dartmoor (High Willhays, 2039 ft.). The westward prolongation of the great south-western promontory of England, occupied by the county of Cornwall, continues as a rugged ridge broken by a succession of depressions, and exceeds a height of 800 ft., nearly as far as the point where it falls to the ocean in the cliffs of Land’s End.

Lowlands.—The localities of the most extensive lowlands of England are generally related to the coastal position and to the principal hill-systems, and in this connexion the names of some of the more important rivers will occur. In the extreme north-west is the so-called Solway Plain, of no great extent, but clearly defined between the northern foothills of the Lake District and the shore of Solway Firth. In Lancashire a flat coastal strip occurs between the western front of the Pennine Chain and the Irish Sea, and, widening southward, extends into Cheshire and comprises the lower valleys of the Mersey and the Dee. In the preceding review of the English hill-systems it may have been observed that eastern England hardly enters into consideration. The reason now becomes clear. From Yorkshire to the flat indented sea-coast north of the Thames estuary, east of the Pennines and the slightly hills indicated as the Northampton uplands, and in part demarcated southward by the East Anglian ridge in Huntingdonshire, Cambridgeshire and Suffolk, the land, although it passed between a succession of river-systems, varies so little in level as to be capable of consideration as a single plain. Its character, however, varies in different parts. The Fens, the flat open levels in the lower basins of the Witham, Welland, Nene and Great Ouse, only kept from their former marshy conditions by an extensive system of artificial drainage, and the similar levels round the head of the Hamber estuary, differ completely in appearance from the higher and firmer parts of the plain. The coast-land north of the mouth of the Thames is a low plain; and on the south coast somewhat similar tracts are found in Romney Marsh, and about the shallow inlets (Portsmouth Harbour and others) which open from Spithead. The vales of Kent and Sussex are rich undulating lowlands within the area of the Weald, separated by the Forest Ridges, and enclosed by the North and South Downs. In the south-west there is a fairly extensive lowland in south Devonshire watered by the Exe in its lower course. But the most remarkable plain is that in Somersetshire, enclosed by the Mendips, the Western Downs, Blackdown Hills and the Quan-tocks and entered by the Parrett and other streams. The midlands, owing to the comparatively slight elevation of the land, are capable of geographical consideration as a plain. But it is not a plain in the sense of that of East Anglia. There is no quite level tract of great extent, excepting perhaps the fertile and beautiful district watered by the lower Severn and its tributary the Upper or Warwickshire Avon, overlooked by the Cotteswolds on the one hand and the Malvern and other hills on the other.

Coast.—The coast-line of England is deeply indented by a succession of large inlets, particularly on the east and west. Thus, from north to south there are, on the east coast, the mouths of the Tyne and the Tees, the Humber estuary, the Wash (which receives the waters of the Witham, Welland, Nene and Great Ouse), the Orwell-Stour, Blackwater and Thames-Medway estuaries. On the west there are Solway Firth, Morecambe Bay, the estuaries of the Mersey and Dee, Cardigan Bay of the Welsh coast, and the Bristol Channel and Severn estuary. In this way the land is so deeply penetrated by the water that no part is more than 75 m. from the sea. Thus Buckinghamshire appears to be the most inland town in England, being 75 m. from the estuaries of the Severn, Thames and Wash; Coleshill, near Birmingham, is also almost exactly 75 m. from the Mersey, Severn and Wash.

The east and south coasts show considerable stretches of uniform uninflected coast-line, and except for the Farne Islands and Holy Island in the extreme north, the flat islands formed by ramifications of the estuaries on the Essex and north Kent coasts, and the Isle of Wight in the south, they are without islands. The west coast, on the other hand, including both shores of the great south-western promontory, is minutely fretted into capes and bays, headlands and inlets of every size, and an island-group lies off each of the more prominent headlands from Land’s End northward. The formation of the coast varies from low, shifting banks of shingle or sand to majestic cliffs, and its character in different localities has been fore-shadowed in the preceding consideration of the hill-systems and lowlands. Thus in the north-east the coast is generally of no great elevation, but the foothills of the Cheviot and Pennine systems approach it closely. On the Yorkshire coast the Cleveland Hills and the high moors are cut off on the seaward side in magnificent cliffs, which reach the greatest elevation of sea-cliffs on the English coast (660 ft.). The Yorkshire Wolds similarly terminate seaward in the noble promontory of Flamborough Head. From this point as far south as the North Foreland of Kent the coast, like the land, is almost wholly low, though there are slight cliffs at some points, as along the coasts of Norfolk and Suffolk, on which the sea constantly encroaches. On the south coast a succession of cliffs and low shores may be correlated with the main physical features of the land. Thus in succession there are the famous white cliffs about Dover, terminating the North Downs, the low coast of Romney Marsh, projecting seaward in Dungeness, the cliffs above Hastings, terminating an offshoot of the Forest Ridges, the low shore between Hastings and Eastbourne, to which succeeds the lofty Beachy Head, terminating the South Downs. A flat coast follows as far as Selsey Bill and Spithead, but the south coast
of the Isle of Wight shows a succession of splendid cliffs. The shallow inlet of Poole Bay is followed by the eminence of St Alban's Head, and thereafter, right round the south-western promontory of England, the cliff-bound coast, with its bays and inlets closely beset with hills, predominates over the low shore-line, exhibits a remarkable series of different forms, and provides the finest scenery of its kind in England. The shores of the Severn estuary are low, but the Welsh coast, sharing the general character of the land, is more or less elevated throughout, though none of the higher mountain-masses directly approaches the sea. Low shores correspond to the plains of Cheshire, Lancashire and the Solway, while the intervening coast is of no great elevation, as only the foothills of the Lake District approach it with a gradual slope.

A great extent of the English coast is constantly undergoing visible alteration, the sea in some instances receding from the land, and in others gaining upon it. The whole of Romney Marsh, in Kent and Sussex, formerly constituted an arm of the sea, where vessels rode in deep water, carrying produce to ports no longer in existence. Lydd and Romney, though maritime mark its former existence. The sea is encroaching over a considerable extent of coast-line on the North Sea as well as on the English Channel. Ravenspur, once an important town of Yorkshire, where Bolingbroke, afterwards Henry IV., landed in 1399, is now submerged; and Dunwich and other ancient ports in East Anglia have met with the same fate. The process of destruction, slow in some places, is so rapid in others that it can be traced even from month to month—the incessant work of the waves washing away the soft strata at the base of the cliffs and leaving the summits unsupported. Many cliffs of the east coast, from the Humber to the mouth of the Thames, are suffering from this destructive action, and instances also occur on the south coast. A royal commission on Coast Erosion was appointed to inquire into this question in 1906 (see Report, 1907 sqq.).

Except along the centre of the Irish Sea, at one point off the Tweed and one between Devon and Normandy, the depth of water between England and the nearest land nowhere exceeds 50 fathoms.

Rivers.—The variations in length of the general slope of the land towards successive natural divisions of the coast may be illustrated by a comparative table of the mileage and drainage areas of the principal English rivers. The mileage does not take account of the lesser sinuosities of rivers.

With the exception of those in the Lake District (p.2) the lakes of England are few and insignificant. A number of small meres occur in a defined area in Cheshire.

(O. J. R. H.)

II. Physical Geography

The object of this section is to give a physical description of England and Wales according to natural regions, which usually follow the geology of the country very closely; although the relationship of configuration and geology is not so simple or so clearly marked as in Scotland.

The land is highest in the west and north, where the rocks also are oldest, most disturbed, and hardest, and the land surface gradually sinks towards the east and south, where the rocks become successively less disturbed, more recent, and softer. The study of the scenery of England and Wales as a whole, or the study of orographical and geological maps of the country, allows a broad distinction to be drawn between the types of land-forms in the west and in the east. This distinction is essential, and applies to all the conditions of which geography takes account. The contrasted districts are separated by an intermediate area, which softens the transition between them, and may be described separately.

The Western Division is composed entirely of Archaean and Palæozoic rocks, embracing the whole range from pre-Cambrian up to Carboniferous. The outcrops of these rocks succeed each other in order of age in roughly concentric belts, with the Archaean mass of the island of Anglesey as a centre, but the arrangement in detail is much disturbed and often very irregular. Contemporary igneous outbursts are extremely common in some of the ancient formations, and add, by their resistance to atmospheric erosion, to the extreme ruggedness of the scenery. The hills and uplands of ancient rocks do not form regular ranges, but rise like islands in four distinct groups from a plain of New Red Sandstone (Permian and Triassic), which separates them from each other and from the newer rocks of the Eastern Division. Each of the uplands is a centre for the dispersal of streams; but with only one prominent exception (the Humber) these reach the sea without crossing into the Eastern Division of the country.

The Eastern Division, lying to the east of the zone of New Red Sandstone, may be defined on the west by a slightly curved line drawn from the estuary of the Tees through Newcastle and Stratford-on-Avon to the estuary of the Severn, and thence through Glastonbury to Sidmouth. It is built up of nearly uniform sheets of Mesozoic rock, the various beds of the Jurassic lying above the New Red Sandstone (Triassic), and dipping south-eastward under the successive beds of the Cretaceous system. In exactly the same way the whole of the south-east of the island appears to have been covered uniformly with gently

1 Partly belonging to Scotland.
2 The principal members of the Humber-system are the Ouse of Yorkshire (121 m. long from the source of the Swale or Ure) and the Trent (170 m.), e.g., for their numerous important tributaries.
3 Including the Medway (680 sq. m.) in the drainage area.
4 Including the Wye (1569 sq. m.) and the Lower Avon (891 sq. m.) in the drainage area.
5 These rivers have their earlier courses in Wales, and flow at first to some point of east. Of wholly Welsh rivers only the Towy and the Taff are comparable in length and drainage area with the smaller rivers in the above list (see Wales).
6 From the source of its headstream the Goyt.
dipping beds of Tertiary sands and clays, beneath which the Cretaceous strata dipped. At some period subsequent to this deposition there was a movement of elevation, which appears to have been along an anticlinal axis running west and east, which was flanked to north and south by synclinal hollows. In these hollows the Tertiary rocks were protected from erosion, and remain to form the London and the Hampshire Basins respectively, while on the anticlinal axis the whole of the Tertiary and the upper Cretaceous strata have been dissected away, and a complex and beautiful configuration has been impressed on the district of the Weald. The general character of the landscape in the Eastern Division is a succession of steep escarpments formed by the edges of the outcropping beds of harder rock, and long gentle slopes or plains on the dip-slopes, or on the softer layers; clay and hard rock alternating throughout the series.

The contrast between the lower grounds of the Western and the Eastern Divisions is marked in many places by the general covering of the surface with glacial drift, which is usually a stiff clay composed on the whole of the detritus of the rocks upon which the glaciers moved. The already-mentioned large patch of black coal, however, has been transported from a considerable distance. This boulder clay covers almost all the low ground north of the Thames Basin, its southern margin fading away into washed sands and gravels.

The history of the origin of the land-forms of England, as far as they have been deduced from geological studies, is exceedingly complicated. The fact that every known geological formation (except the Miocene) is represented, proves of itself how long the history has been, and how multifarious the changes. It must suffice to say that the separation of Ireland from England was a comparatively recent episode, while the severance of the land-connection between England and the continent by the formation of the Strait of Dover is still more recent and probably occurred with the human period.

**Natural Divisions.**—The four prominent groups of high land rising from the plain of the Red Rocks are: (1) the Lake District, occupied by the Lake district of the Southern Uplands, or group of valleys of the Eden and the Lune; (2) the Pennine Region, which stretches from the Scottish border to the centre of England, running south; (3) Wales, occupying the peninsula between the Mersey and the Bristol Channel, and extending beyond the political boundaries of the principality to include Shropshire and Hereford; and (4) the peninsula of Cornwall and Devon. They are all similar in the great features of their land-forms, which are due to the action of atmospheric denudation rather than by the original order and arrangement of the rocks; but each group has its own geological character, which has imparted something of a distinctive individuality to itself. When once a region begins to widen out and extend, it depends for its prosperity on mineral products and manufactures rather than on farming; and the staple of the farmers is live-stock rather than agriculture. The people of the more rugged and remoter groups, in short, are the race survivors of the early Celtic stock, which, being driven by successive invaders from the open and fertile country of the Eastern Division, found refuges in the less inviting but more easily defended lands of the west. Even where, as in the Pennine and the Lake District, the people have been completely assimilated with the Teutonic stock, they retain a typical character, marked by independence of opinion approaching stubbornness, and by great determination and enterprise.

**Lake District.**—The Lake District occupies the counties of Cumberland and Westmoreland, and forms a roughly circular highland area, the drainage lines of which radiate outward from the centre in a series of narrow valleys, the upper parts of which cut deeply into the mountains, and the lower widen into the surrounding plains. Most of the district is formed of great masses of volcanic ashes and tuffs, with intrusions of basalt and granite, all of Ordovician (Lower Silurian) age. Scafell and Scafell Pike (3162 and 3210 ft.), at the head of Wastwater, and Helvellyn (3186), at the head of Ullswater, are the loftiest among many summits the grandeur of whose outlines is not to be estimated by their moderate height. Sedimentary rocks of the same age form a belt to the north, and include Skiddaw, Blencathra, and Helvellyn, and this belt is a continuation of the Lake District. The eastern face of Helvellyn is covered with boulder clay, forms the finely wooded valleys of Coniston and Windermere. Round these central masses of early Palaeozoic rocks there is a broken ring of Carboniferous Limestone, and within it are patches of drift, chiefly Ironstones of Barrow-in-Furness, now the largest town in the district. On the outer border, the Lake District is very thinly peopled; and from the economic point of view, the remarkable beauty of its scenery, attracting numerous residents and tourists, is the most valuable feature. In the north and south, the eastern border is reached by drift, and in the west by boulder clay. But in the west of England, has led to the utilization of Thirlmere as a reservoir for the water supply of Manchester, over 80 m. distant.

**Peninsular Region.**—The Peninsular Region, the centre of which is Plymouth, is a part of the western region of Devon and Cornwall. It is a group of narrow valleys, the Eden valley to the North Sea in the north, and from the lower Tees, Yorkshire Ouse and Trent, nearly to the Irish Sea, in the south. It includes the whole of Northumberland and Durham, and the counties of the East Riding of Yorkshire, the north and west of the county of the West Riding, the north of Staffordshire and the west of Nottinghamshire. The region is entirely composed of Carboniferous rocks, the system which extends all others in the value of its economic minerals. The Pennine Pennine Region, to have many of its mountain and escarpment borders, the centres of the mineral districts, and the centres of densest population, in the county, or even in the world. The whole region may be looked upon as formed by an arch or anticline of Carboniferous strata, the axis of which, being as large as that of the Pennine Pennine Region, drift and is a continuation of the Weald. The term is used for the sediments of Permian and Triassic age. The northern part of the western side of the anticline is broken off by a great fault in the valley of the Eden, and the southern head of the Yoredale is of a sheet of intrusive basalt. Seen from the valley, this straight line of lofty heights, culminating in Crossfell, presents the nearest approach in England to the appearance of a mountain range. In the north, the Pennine Pennine Region is won by the Northumberland and Yorkshire mountains, and in the Berwickshire area by the Northumberland Chain, which passes into Scotland by the Cheviot Hills, a mass of granite and Old Red Sandstone; and the northern part is largely traversed by dykes of contemporary volcanic or intrusive rock. The most striking of these dykes is the Great Whin Sill, which crosses the country from a short distance south of Durham to the Wash near Crossfell. The elevated land is divided into three masses by depressions, which furnish ready means of communication between east and west, and whose waters are either in the north and south by the valleys of the Aire and Ribble from the Kinder Scout or Peak section. The numerous streams of the region carry off the rainfall down long valleys or dales to the east and the south, and their watercourses are often separated from each other by high uplands, which for the most part are heathery moorland or, at best, hill pastures. The agriculture of the region is confined to the bottoms of the dales, and is of small importance. Crossfell and the opposing hill are formed from masses of Carboniferous Limestone, which received its popular name of Mount Limestone from this fact. Farther south, such mountains as High Seat, Whernside, Bow Fell, Penyghent and many others, are composed of the grits and sandstones which rest upon the limestone. The belt of Millstone Grit south of the Aire, lying between the great coal-fields of the West Riding and Lancashire, has a lower elevation, and forms grassy uplands traversed by the Vale of Ainsty and the Grosmont valley. A small central section occurs in the limestones of Derbyshire, in which the range terminates. The rugged beauty of the south-running valleys, and especially of Dove Dale, is enhanced by the rich woods which still clothe the upper sides of the streams, as well as on the surface, the caverns and subterranean streams of Yorkshire and Derbyshire being amongst the deepest that have yet been explored. Compared with the rugged and picturesque scenery of the Lake District and the Pennine Region, the scenery of the southern region is smooth, featureless and monotonous. The coal-fields on the eastern side of the Tyne nearly to the Trent, are sharply marked off on the east by the outcrop of Permian dolomite or Magnesian limestone, and on the west by the Ouse Beck, a continuation of the Ribble, which washes in part the Black Mountains in Wales, and in part the Skerne and Guizable rivers, which drain into the Tees, and in many places giving rise to an escarpment facing westward towards the gentle slope of the Pennine dales. To the west and south the Coal Measures dip gently under the New Red Sandstone, to reappear at several points through the Triglav plains. The clear water of the upland beck bottoms and the plentiful supply of water has often led to the founding of small paper-mills in remote valleys before the days of steam, and some of these primitive establishments still
exist. The prosperity and great population of the Pennine region date from the discovery that pit-coal could smelt iron as well as charcoal; and this source of power once discovered, the people bred in the dales developed a remarkable genius for mechanical invention. Industrial development was naturally associated with the opening up of the world and changed England from an agricultural to an industrial country. The staple industry of the district in ancient times was sheep-rearing, and the villages in nearly all the dales carried on trade in the manufacture of woollen cloth; the introduction of cotton caused the woollen manufactures on the western side to be superseded by the working up of the imported raw material; but woollen manufactures, themselves carried on now almost entirely with foreign imported raw materials, have been established by the inhabitants of the east. Some quiet market-towns, such as Skipton and Keighley, remain, but most of them have developed by manufactures into great centres of population, lying, as a rule, at or near the centres of the manufactured goods. The sheep-raising of the west is still another by the empty uplands. Such are Leeds, Bradford, Sheffield, Huddersfield and Halifax on the great and densely peopled West Riding coal-field, which lies on the eastern slope of the Pennines. The iron ores of the Pennines have given rise to great manufactures, the steel from cumbury to knife and armament. High on the barren crest of the Pennines, where the rocks yield no mineral wealth, except in medicinal waters, Harrogate, Buxton and Matlock are types of health resorts, prosperous from their popular waters. The upland population of the Pennines is far from as high as that of the antincline, the vast and dense population of the Lancashire coal-field is crowded in the manufacturing towns surrounding the great commercial centre, Manchester, which itself stands on the edge of the plain. Some of the rivers that flow down the valley of the Ouse, Wharfe, and Wigan form a nearly confluent semicircle of great towns, their prosperity founded on the underlying coal and iron, maintained by imported cotton. The Lancashire coal-field, and the portion of the border coal-field in Lancashire and Yorkshire, though limited, is populous in proportion than that borne by any equal area in the country of London and its surroundings not excepted. In the south-west of the Pennine region the coal-field of North Staffordshire supplies the great works of Crewe and Crewe with fuel, and the staple of their trade as “The Potteries.” On the north-east the great coal-field of Northumberland and Durham, traversed midway by the Tyne, supplies the manufactures of Newcastle and its satellites. Ironworks, and leaves a great surplus for export from the Tyne ports.

Wales.—The low island of Anglesey, which is built upon the fundamental Archean rocks, is important as a link in the main line of the coal-field of Denbighshire, the industry of its eastern part is eclipsed by that of the mainland by a channel narrow enough to be bridged, and lies not far out from the straight line joining London and Dublin. The mainland of Wales rises into three main ranges, the mountain groups of North, Mid, and South Wales, connected together by land over 1000 ft. in elevation in most places, but separated by valleys affording easy highways. The streams of the southern and western slopes are short and many, flowing directly to the Bristol Channel, and the mountainous districts are dotted with lakes and tarns. The eastern slopes gather themselves into three river systems, and reach the sea as the Dee, the Severn, and the Wye. The mountain group of North Wales is the largest and loveliest; its scenery resembles that of the Lake District and the Rhineland. The ancient Palaeozoic rocks—Cambrian and Ordovician, often altered into slate—and contemporaneous volcanic outbursts and igneous intrusions. Here rises the peak of Snowdon (3560 ft.), the culminating height of Wales, a group of artificial lakes, one of them exceeded 3000 ft., while Cader Idris, farther south, though slightly lower, presents a singularly imposing outline. The mild winter climate has fringed the coast with seaside resorts, the rugged heights attract tourists in summer, and the vast masses of slate, have given rise to the largest slate quarries in the world. The heights of the upper valleys unfit them for agriculture, and the farms are poor. There are several lakes: that of Bala being the largest, except the lake of Windermere artificially to store the rainwater for the water-supply of Liverpool, 68 in. deep. The River Deben, the inlet of Vyrnwy is tributary to the Severn; but north of it the streams gather into the Dee, and flow eventually northward. Mid Wales is built up on the peninsula, for the most part, of Silurian or Ordovician rocks, practically free from coal and coal-measures. They are dissected into small ranges, the resistance of a series of igneous dykes gives prominence to the Pembrokeshire upland, in which the fine fjord-like harbour of Milford Haven lies far out towards the Atlantic. The coast north of Pembroke has been carved by the sea; it is crescentic in form, looking like Cardigan Bay, its surface carved into gently rounded hills, green with rich grass, which sweep downward to wide rounded valleys. Penllynmoor (2406 ft.) is the highest of the hills, and forms a sort of bight of land between Cardigan Bay and the Bristol Channel; the estuaries of the Towy, the Teifi, and the Loughor, empty into the Bristol Channel. The Severn and the Wye take their rise—the former describing a wide curve to east and south, the latter forming a chord to the arc in its southwestward course. Mid Wales is a chiefly pastoral country, and very thinly peopled. A group of artificial lakes, one of them exceeding 3000 ft. in area only by Windermere, has been formed in the valley of the Elan, a tributary of the Wye, for the supply of water to Birmingham.

The west of the country is divided into seven districts: Breconshire (Brecon), Monmouthshire, Radnorshire (Radnor), Herefordshire, Shropshire, Salop, and Montgomeryshire. It is chiefly occupied by highlands, the most remarkable being the highlands of Herefordshire and Shropshire, which sweep downward in a great concave, almost parallel to the Severn and Wye, with a succession of small fragments and outliers of high ground. The Severn, at the junction of the Welsh and English counties, isHerefordshire, the longest river in Britain.

The Severn and Wye have their rise in the Wales, running on the whole from west to east, marks the outliers of the Old Red Sandstone and Carboniferous strata which lie within a vast syncline of the Silurian rocks. The Brecon Beacons of Old Red Sandstone are the highest (2907 ft.), but the Black Mountain bears a number of picturesque summits, the highest of which is Pen-y-Fan, 2712 ft., on the Carboniferous Limestone, which rise frequently over 2000 ft. Throughout the vale of Mercia, in part of Monmouthshire, the Old Red Sandstone sinks to a level, traversed by the curious windings of the Wye, and forms the uplands of Herefordshire, the present aspect of the uplands of coal and fruit lands of England. This plain formed an easy passage from the north, and at the time of the Romans was a strategical line of the greatest importance, a fact which has left its traces on the present distribution of towns. The manufacturing and northern edge of the Old Red Sandstone plain the underlying Silurian limestone (and Arcaean in places) have been bent up so that their edges form hills of singular abruptness and beauty. Of these are the Malvern Hills, east of Hereford, and in particular the hills of Shropshire. Wenlock Edge, a continuation of the highland of Shropshire of Silurian limestone, while the broad uplands of Long Mynd, nearly parallel to it on the north, is a mass of Arcaean rock. The Wrekin, the Caerphilly and Cardington Hills are isolated outcrops of pre-Cambrian granite rocks which form a set of great masses and broken series of coal-fields, where patches of Carboniferous strata cover the surface on the edge of the New Red Sandstone plain. Such are the coal-fields of Flint in the north, the Forest of Wye and Wye Valley in the south. Along the margin of the Brecon Beacons, the Coal-field on the south is a perfect example of a synclinal basin, the Millstone Grit and Carboniferous Limestone which form the Coal Measures appearing all round the margin. This coal-field occupies the country of Brecknockshite, and its surface slopes from the Black Mountain and Brecon Beacons to the sea as a gently inclined plateau, scored by deep valleys draining south. The Each valley has a railway connecting a string of mining villages and coal towns, of great beauty. The Brecon Beacons and the Brecon Beacon is a town created on a sandy island by the excavation of a great deep to form an outlet for the mines. In the middle, where the limestone crop out and supplies the necessary flux for the iron smelting, the landscape is broken by the remains of the Rhosybar, and in the west Swansea is the chief centre in the world for copper and tin smelting. The unity and ruggedness of the highlands of Wales have proved sufficient to isolate the people from those of the rest of Britain; and to preserve a purely Celtic race, still very largely of Celtic speech.

Cornwall and Devon.—The peninsula of Cornwall and Devon may be looked upon as formed from a synclinal trough of Devonian rocks, the northern end of which is covered by the Tertiary and the south and north, while the centre is occupied by Lower Carboniferous and Tertiary strata. The northern coast, bordering the Bristol Channel, is steep, with picturesque cliffs and deep bays or short valleys running into the high land, each occupied by a little seaside town or village. The plateau culminates in the barren heathy upland of Exmoor, which slopes gently southward from a general elevation of 1000 ft., and is almost without inhabitants. The Carboniferous rocks of the centre, which produce rich pasture under the heavy rainfall and remarkably mild climate of the district, are the great cattle-raising districts. The Devonian strata on the south do not form such lofty elevations as those on the north, and are in consequence, less fertile and peculiarly adapted for farming. The plains of Exeter, Barnstaple, and the tin-mining districts in the north, are to some extent assisted by the establishment in its midst of a great convict prison, and in its northern portion of a range for artillery practice. The Tamar flows from north to south on the Devonian plain, which lies between Dartmoor and Bodmin Moor (where Brown Willy rises to 1345 ft.) on the west. There are several smaller granite bosses, of which the mass of Land’s End is the most important. Most of the Lizard peninsula, the only projecting point of the whole southern coast, is granite. The great variety of the rocks which meet the sea along the south of Cornwall and Devon has led to the formation of a singularly picturesque coast—the headlands being carved from the hardest igneous rock, and the curves of the shore from the Tertiary rocks, atli's of Falmouth, Plymouth and Dartmouth are splendid natural harbours, which would have developed great commercial ports but for their remoteness from the centres of commerce and manufactures. The fishing industry, once abounding at the contacts between the granite and the rocks it pierced, were the former staples of wealth, and the mining largely accounts for the exceptional density of population in Cornwall. Fishing has always been important, the numerous good harbours giving security to fishing-boats; and the fact that this coast is the mildest and almost the sunniest, though by no means the driest, part of Great Britain has led to the establishment of many health
resorts, of which Torquay is the chief. The old Cornish language of the Celtic stock became extinct only in the 18th century, and the Cornish character remains as a heritage of the time when the land had to mould to life and the habits of the man. Projecting farther than any other English county towards the Atlantic coast, it has a West country has supplied a large proportion of the great naval commanders in British history, and of the crews of the navy.

Between the separate uplands there extends a plain of Permian and Triassic rocks. The upland plain is an intermediate zone between the two main divisions.

The midland plain. To the eye it forms an almost continuous plain with the belt of Lias clays, which is the outer border of the Eastern Divisions. It extends on the main course of the Severn, and seems to influence the direction of the main rivers, there is only one plain so far as regards free movement over its surface and the construction of canals, roads and railways. The plain extends from the Middlesbrough Pennine escarpment, to the edge of the Triassic plain from the south coast at the mouth of the Thames to the east coast at the mouth of the Tees. This is the present day, having been formed by the erosion of the whole of the rest of England except where the Tertiary Basins of London and Hampshire cover it, where the depression of the Kent Valley carries it out of sight, and where the lower rocks of the Weald of Kent are exposed. The depression between the escarpments of the uplands of more ancient rock, though to the east of the Cornwall-Devon peninsula it is not very clear, and its continuity in other places is broken by inlets of the more ancient rocks, which everywhere underlie it. One such outcrop of Carboniferous Lime-stone in the south forms the Mendip Hills; another of the Coal Measures increases the importance of Bristol, where it stands at the head of navigation on the southern Avon. In the north-west a tongue of the Red rocks forms the Eden valley, separating the Lake District from the Pennine Chain, with Carlisle as its central town. Farther south, these rocks form the low coastal belt of Lancashire, edged with the longest stretches of blown sand in England, and dotted here and there by large sandy post-glacial ploughing. There is a narrow plain, near close to the Jurassic escarpment. The plain forms the valley of the Derwent from Stockport to the sea, and farther south in Cheshire the salt-bearing beds of the Keeper marls give rise to the high salinae, which are common in the county, and which give the name of Chester to Cheshire and Worcester, forming the lower valley of the Severn. The greater part of Manchester, all Liverpool and Birkenhead, and innumerable busy towns of medium size, which in other parts of England are usually rural in character. The Liverpool plain is thus explained. South of the Pennines, the Red rocks extend eastward in a great sweep through the south of Derbyshire, Warwick, the west of Leicestershire, and the east of Nottingham, their margin being marked by a very lowland belt of coalfields, and by the Soar and Trent, flowing north-east. South and east of these streams the very similar country is on the Lias clay. Several small coal-fields rise through the Red rocks—the largest, between Stafford and Birmingham, forms the famous "Black Country." With Wolverhampton and Dudley as centres, where the manufacture of iron has preserved a historic continuity, for the great Forest of Arden supplied charcoal until the new fuel from the pits took its place. This coal-field, extending from the Wrekin, as the old English word for "mountain" is, constitutes the centre of the Midlands. Smaller patches of the Coal Measures appear near Tamworth and Burton, while deep shafts have been sunk in many places through the overlying Triassic strata to the coal, which is nowhere in the English coalfields beyond the actual outcrop of the Coal Measures. A few small outcrops occur where still more ancient strata have been raised to the surface, as, for instance, in Charnwood Forest, where the Archaean rocks are exposed, and where the erosion of granite, create a patch of highland scenery in the very heart of the English plain; and in the Lickley Hills, near Birmingham, where the prominent features are due to volcanic rocks of very ancient date. The Waterstones, or Lower Keuper Sandstones, are in some places elevated above the softer beds, and are usually charged with an abundant supply of water, which can be reached by wells,—form the site of many towns, such as Birmingham, Warwick and Lichfield, and of very numerous villages. The plain as a whole is a very productive and busy one, and the Oxfordshire pasture: the very heart of rural England. Cattle-grazing is the chief farm industry in the west, sheep and horse-rearing in the east; the prevalence of the prefix "Market" in the names of the rural districts, and the existence of great sheepdog shows, is a result of the raising of live stock; Leicester, Coventry and Nottingham are manufacturing towns of the region. The historic castles, the sites of ancient battles, and of old charters, and the stream of men and goods which has been an important feature of Eastern England, show that the heart of the region has been a great land to the progress of the English people. The land is broken by a number of isolated mountain rises, and by the presence of a number of permanent lakes. The drainage is good, and the rivers are navigable, with the exception of the Humber, and similarly direct the course of the Avon southward to the Severn. The great feature of the region is the long line of the Oolitic escarpment, formed in different places by the edges of different old beds, and by the presence of the Triassic coast. The southern slopes of the escarpment are formed by the chalk of the English Channel, curves north-east as the Cotswold Hills, rising abruptly from the Severn plains of heights of over 1000 ft.; it sinks to insignificance in the Midlands country, is again clearly visible in the north, and finally disappears below the sea. The Escarpment is the rim of a great basin, of which the course is over 1500 ft. Deep towards the west, where it overlooks the low Lias plain as the Oolitic escarpment, the land falls very gently in slopes of Oxford Clay towards the Severn. Throughout its whole extent it yields valuable building-stone, and in the Yorkshire moors on the east. Where the plain reaches the sea, the soft rock are cut back into the estuary of the Tees, and there Middle-borough stands at the base of the Moors. The quiet beauty of the rural country in the south, where the barren Bunter pebble-beds have never invited agriculture, and where considerable vestiges of the old woodland still remain in and near Sherwood Forest, has attracted so many seats of the landed aristocracy as to earn for that part the familiar name of "the Dukeries." The central position of York in times, and an important railway junction in our own.
moors the great abundance of iron ore has created the prosperity of Middleham, on the plain below. The Lias plain is rich grazing country, the Oxford Clay forms valuable agricultural land, yielding heavy crops of wheat. The towns of the belt are comparatively small, and not one attains a population of 75,000, and the favourite site is on the Lias plain below the great escarpments. They are for the most part typical rural market-towns, the manufactures, where such exist, being usually of agricultural machinery, or woollen and leather goods. The chief towns in the district are Bury St. Edmunds, Rugby, Lincoln and Scarborough amongst the chief. North of the gap in the low escarpment in which the town of Lincoln centres, a close fringe of villages borders the escarpment on the west, and throughout the belt the alternations of clay and hard rock are reflected in the grouping of population.

The Chalk Country.—The dominating surface-feature formed by the Cretaceous rocks is the Chalk escarpment, the northern edge of which forms one of the plateaux of the British Isles. The escarpment is a whole south-east. It appears as a series of rounded hills of great elevation, running in a curve from the mouth of the Axe to Flamborough Head, roughly parallel with the Oolitic escarpment. Succession of the escarpment, the White Horse Hills, the Chiltern Hills, the East Anglian Ridge, the Lincolnshire Wolds and the Yorkshire Wolds. The rivers from the gentle southern slopes of the Oolitic heights pass by deep vales, and the chalk escarpments and flood-lands of Tertiary plains within. The typical scenery of the Chalk country is unknown by small streams of running water; the hills rise into rounded downs, often capped with fine clumps of beech, and usually wooded. The chalk country is a great storehouse of chalk, when exposed on the surface, is an excellent foundation for roads, and the lines of many of the Roman 'streets' were probably determined by this fact. The Chalk country extends over parts of the southern Belts of Wiltshire, Oxfordshire, and Hampshire and Oxfordshire, most of Hertfordshire and Cambridgeshire, the west of Norfolk and Suffolk, the east of Lincolnshire, and the East Riding of Yorkshire. The upland of Salisbury Plain, which comprises the raised basin of the Jurassic rocks of the double fold into which the strata of the south of England have been thrown, the great Chalk escarpment runs north-eastward; fingers of Chalk run eastward each side of the Weald, forming the North and South Downs, while the southern edge of the Chalk slanting slope falls to the Wealden Basin through the level of the south coast, and especially in the Isle of Wight. Flamborough Head, the South Foreland, Beachy Head and the Needles are examples of the fine scenery into which chalk weathers where it fronts the sea, while the downland is made up of the chalk richest in hops and wheat. The primitive forests have been largely cleared, the primitive manse has all been drained, and the Weald Clay district is fairly well peopled and sprinkled with villages, while the downs such as of the Chiltern, the downs of the Hastings Beds emerge steeply, and reaches in the centre a elevation of 796 ft. at Crowborough Beacon. It is on the whole a region with few streams, and a considerable portion of the chalk woodland still remains in Ashdown Forest. The greater part of the Forest Ridges is almost without inhabitants. Towns are found only round the edge bordering the Weald Clay, such as Tunbridge, Tunbridge Wells and Horsham; and along the Sussex coast are a series of small towns, such as Hastings and Newhaven. The broad low tongue of Romney Marsh running out to Dungeness is a product of shore-building by the Channel tides, attached to the Wealden area, but not essentially part of it.

The Thames.—A belt six miles wide occupies a triangular depression in the Chalk which is filled up with clays and gravels of Tertiary and later age. It extends from the eastern extremity of Wiltshire in a widening triangle to the sea, which it meets along villages, while the East Anglian portion of the belt consists of the more recent Peiocene clays and gravels, which mix with the boulder clay to form the best wheat-growing soil in the country.

The Hampshire Basin.—The Hampshire Basin forms a triangle
with Dorchester, Salisbury and Worthing near the angles, and the
rim of Chalk to the south appears in broken fragments in the
Isle of Purbeck, the Isle of Wight, and to the east of Bognor. On the
infertile Bagshot Beds the large area of the New Forest remains
unproductive, its ancient oaks. The London Clay of the east is
more fertile, but the greatness of this district lies in its coast-line,
which is deeply indented, like that of the London Basin. South-
ampton and Portsmouth have gained importance through their fine
data and its ports, especially the great mail route. The
Bournemouth and Bognor, from their favourite position in the
sunniest belt of the country, are health resorts.

Communications.—The configuration of England, while sufficiently
pronounced, is not strongly enough marked to exercise any very
great influence upon lines of communication. The navigable rivers
are all connected by barge-canals, even across the Pennine Chain.
Although the waterways are much neglected, compared with those
of France, were they to be enlarged and improved and if free competition with railways
could be secured. The main roads laid out as arteries of
communication by the Romans, suffered to fall into neglect, and
revisited only during the days of the beginning of the 19th century,
fell into a second period of comparative neglect when the railway
system was established; they have however a very large share of
their old importance in the consequence of the development of motor-
traffic. The high roads of the Eastern Division very frequently run along the coasts of rivers or
escarpments; but in the Western Division they are, as a rule, forced
by the more commanding relief of the country to keep to the river
valleys, and by the rougher districts through the dales or pass
when the railways themselves, radiating from the great centres of
population, and especially from London, are only in a few instances much
affected by the configuration. The Pennine Chain has always separated the
travelling from the south to north into an east coast route through the
Vale of York, and a west coast route by the Lancashire plain.

The Middle railway, running through the high and rugged country
between the two, was the last to be constructed. The most notable
bridges and navigable water affording continuous routes are those
across Menai Strait, the Tyne at Newcastle, the Severn at Severn
Bridge, and the Manchester Ship Canal. It is more usual to tunnel
under such channels, and the numerous Thames tunnels, the Mersey
tunnel, and Liverpool and Birkenhead, and the Severn tunnel,
the longest in the British Islands (44 m.), on the routes from London
to South Wales, and from Bristol to the north of England, are
all important. The Humber estuary is neither bridged nor tunnelled
below Goole.

Density of Population.—The present distribution of population
over England and Wales shows a dense concentration at all large
seaports, in the neighbourhood of London, and on the coal-fields
where manufactures are carried on. Agricultural areas are very
thining, and purely pastoral districts can hardly be said to have
any settled population at all. There are very few dwellings situated
at a higher level than 1000 ft., and on the lower ground the Chalk
and the Oolitic limestones, where they crop out on the surface,
are thinly peopled, and so as a rule are areas of alluvial deposits and the Tertiary sands. But, on the other hand, the
clay plains of all formations, the Cretaceous sandstones, and
the Triassic plain, are peopled more densely than any other district
without mineral wealth or sea trade.

Political Divisions.—In the partition of England and Wales into
counties, physical features play but a small part. The forty ancient
counties, remnants of various historical groupings and parts,
are divided by the Rivers. Thus the Thames divides
the counties along nearly its whole length, forming the southern
boundary of four and the northern boundary of three. Essex and
Suffolk, Suffolk and Norfolk, Cornwall and Devon, Durham and York
and York and Northumberland are all separated by rivers, while
rivers form some part of the boundaries of almost every county.
Still, it is noteworthy that the Severn and Trent nowhere form
continuous county boundaries. Watersheds are rarely used as
boundaries for any district, but, although slightly overlapping
the watershed on all sides, Yorkshire is very nearly considered
with the basin of the Ouse. The boundaries of the parishes, the
fundamental units of English political geography, are very often
the river or watershed, and they frequently show a close relation
to the strike of the geological strata. The hundreds, or groups of
parishes, necessarily share their boundaries, and groups of hundreds are
often aggregated to form larger subdivisions of counties. A wider grouping according to natural characteristics may now be
recognized in the cases of Wales, East Anglia, Worcestershire and
less definite groups as the Home Counties around London or the
Midlands around Birmingham. Configuration is only one out of
many conditions modifying distributions, and its effects on England
as a whole appear to be suggestive rather than determinative.

(H. R. M.)

III. GEOLOGY

For an area so small, England is peculiarly rich in geological
interest. This is due in some degree to the energy of the early
British geologists, whose work profoundly influenced all sub-
sequent thought in the science, as may be seen by the general
acceptance of so many of the English stratigraphical terms; but
the natural conditions were such as to call forth and to stimulate
this energy in an unusual way. Almost every one of the principal
geological formations may be studied in England with com-
parative ease.

If we lay aside for the moment all the minor irregularities, we
find, upon examination of a geological map of England, two structural
features of outstanding importance. (1) The first is the great
antilithons of the Pennine Hills which dominates the northern half
of England from the Scottish border to Derby. Its central core of

Lower Carboniferous rock is broadly displayed towards the north,
while southward it contracts; on either side lie the younger rocks,
the coal-fields, the Pennian strata and the Triassic formations;
the last-named, while sweeping round the southern extremity of
the Carboniferous axis of the uplift from its eastern and western
flanks, spread out in a large sheet over the midland counties. (2)

The second striking feature is the regular succession of Jurassic
and Cretaceous rocks which crop out in almost unbroken lines from
the coast of Dorsetshire, whither they appear to converge, to the
Cleveland Hills and the Yorkshire coast. Lying upon the Cretaceous
rocks in the S.E. of England are the Tertiary basins of London
and Hampshire, separated by the dissected anticline of the Weald.

The older rocks in England occupy relatively small areas. Pre-
Cambrian rocks are represented by the gneisses of Primrose Hill
and schists of Rushdon in Shropshire; by the gneisses forming the
core of the Malvern Hills, and by the ancient volcanic and other rocks
of the Wrekin, Charnwood Forest and Nuneaton. The slates of the
Long Mynd, on the Shropshire border, belong to this system.
Cambrian strata appear in Shropshire in the form of sandstones and
quartzites; in the Malvern Hills they are black shales, while in the
Lake District they are represented by the Skiddaw slates. Next in point of age comes the Ordovician system, which is well developed upon the Shropshire border and in the Lake District. In the same two areas we find the Silurian rocks, shales and limestones with grits and shales; the corresponding Old Red Sandstone type of the system (marls and sandstones) being exposed over a large part of Herefordshire, stretching also into Shropshire and Monmouth. Next in age are the Devonian rocks, comprising limestones, shales and limestones in the lower members, grits, sandstones and shales—the Millstone Grit series—in the middle of the system, followed by the Coal Measures—a great series of shales with coal, sandstones and shales. Devonian rocks are also very abundant in England occupies a large area in England. The limestones and shales are well exposed in Derbyshire, Yorkshire, Northumberland, the Mendip Hills and at Clifton. The Millstone Grit series is prominent in Lincolnshire, and is seen also in Herefordshire, the Forest of Dean. The Coal Measures rest upon the Millstone Grits in most places, generally in synclinal basins. On the eastern side of the Pennine range are the conterminous coal-fields of Yorkshire, Derbyshire, Lancashire, Cumberland, Northumberland and Durham; on the western side are the Whitehaven, Burnley, S. Lancashire and N. Staffordshire coal-fields. Further south are the S. Staffordshire, Warwickshire, Coalbrook Dale, Forest of Wyre, Forest of Dean and Bristol and Somerset coal-fields, and in the south-east of England, as has been proved at Dover. A large part of N. Devon is occupied by the Curns shales, limestones and grits of Carboniferous age. The principal development of Permian rocks is the narrow Pennine district. The most characteristic feature of this district is the Vernoian limestone is the characteristic feature. On the other side of the Pennine hills we find the Permian sandstone of the Vale of Eden and the Brocken beds of the Lake District. Red sandstones and sandstones are also characteristic of the Devonian rocks in the same area, which form the picturesque scenery about Dawlish and Teignmouth.

The Triassic rocks, red sandstones, marls and conglomerates cover a broad area in the Midlands in Worcestershire, Warwickshire and Leicestershire, whence they may be followed southwards through Somerset to the coast at Sidmouth, and northward, round either flank of the Pennine Hills, through Nottinghamshire and Yorkshire to Middlesbrough on the one hand, and upon the other through Herefordshire and Staffordshire to the Lichfield district.

The outcrop of the Lias, mainly clay with thin limestones and ironstones, runs in an almost continuous band across the country from Lyme Regis, through Bath, Cheltenham, near Leicester, and Lincolnshire, and the North, where they are the alternating clays and limestones of the Oolitic series. Next in order come the Greensands and Gault, which lie at the base of the Chalk escarpment, between that formation and the Oolites. The Chalk is an alternating series of chalk and marl, and the different members form the soils of the chalk districts. The Chalk is covered by younger deposits of Tertiary age; the Pliocene Crags of Norfolk and Suffolk, the Lower London Tertiaries (London Clay, Woolwich and Reading Beds, &c.) of the London Basin, the Chalk and Eocene of the Hoo Peninsula, the Berks, and northern Kent. Again, in the Hampshire Basin and Isle of Wight, Eocene and Oligocene formations rest upon the Chalk.

When we attempt to decipher the physical history of the country from the existing features or from the old physical formation, we are at the outset the detailed information from being able to picture the geographical condition in the older Palaeozoic periods. All we can say is, that in those remote times the whole of England had no existence; its site was occupied by the sea, and the land was tenanted by marine invertebrates, long since extinct. As for the boundaries of these ancient seas, we can say nothing with certainty, but it is of interest to note the evidence we possess of still older land formations in the interior of England. In the Devonian period it is clear that an elevated movement had set in towards the north, which gave rise to the formation of inland lakes and narrow estuaries in which the Old Red Sandstone rocks were formed, while in the south of England lay the broad and deep estuaries of the Tertiary foreland. The rise of the Carboniferous period, which began with fairly open sea over the south and north of England, but in the centre there rose an elevated land mass from which much of the Millstone Grit was derived; other parts of the Carboniferous district were the south-west, and southern Britain, which formed a land-bridge between north-west Europe and the land which is now the Pennine ridge and Triassic periods. It was about this time that the Pennine Hills, the Lake District mountain mass, and the Mendip Hills were being most vigorously uplifted, while the granite masses of Cornwall and Devon were perhaps being injected into the Carboniferous and Devonian rocks. From this period, more or less of the Pennine ridge has always remained above the sea, along with much of Cornwall and parts of Devonshire.

In early Jurassic times the sea probably again occupied most of England with the exception of the above-mentioned areas, the Lake District and eastern part of the London Basin; Wales, too, and much of Scotland were land. Elevation gradually caused more land to be formed, and the first great valley system of the country—the Gorge system, now entirely obliterated, drained into the Purbeck estuary and Wealden lake; but a subsequent depression led to the wide extension of the Chalk sea. By the beginning of the Eocene period, much of the old land was still above sea, but the Chalk sea was now extended along the parts of the continent nearest to England. The Mersey estuary, being partly sheltered by Ireland and North Wales, does not serve as an inlet for smoothing influences to the same extent as the Bristol Channel; and as the wind entering by it blows squarely against the slope of the Pennine Chain, it does not much affect the climate of the midland plain.

**IV. Climate.**

**Temperature.**—The mean annual temperature of the whole of England and Wales (reduced to sea-level) is about 50° F, varying from something over 52° in the Scilly Isles to something under 48° at the mouth of the Tweed. The mean annual temperature diminishes very regularly from south-west to north-east, the west coast being warmer than the east, so that the mean temperature at the mouth of the Mersey is as high as that at the mouth of the Thames. During the coldest month of the year the mean temperature is about 34° to 36°, and the mean temperature of the month is above 50°; the influence of the western ocean is very strongly marked, the temperature falling steadily from west to east. Thus while the temperature in the west of Cornwall is 44°, the temperature on the east coast of Yorkshire is 24°. The winter is the coldest in the north-east of England, as is also the spring, while the summers are the warmest in the south and west, the winters being experienced in the Fenland. In the February month (July) the mean temperature of England and Wales is about 61° S., and the westerly wind then exercises a cooling effect, the greatest heat being at the Thames basin immediately around London, where the mean temperature of the month exceeds 64°, the mean temperature along the south coast is 62°, and that at the mouth of the Tweed lies above 59°. In the centre of the country along a line from London to Carlisle the mean temperature in July is found to diminish gradually northwards.

The coasts are cooler than the centre of the country, but the west coast is much cooler than the east, modified continental conditions prevailing over the North Sea. The natural effect of the heating of the shallow water of the North Sea is felt in the east along the coast; in the west the land is largely masked in England on account of the strength of the prevailing westerly wind carrying oceanic influence into the heart of the country. This effect is well seen in the way the climate along the Thames is modified by winds from the north-east, the climate along the Thames is modified by winds from the north-east.

**Winds.**—The average barometric pressure over England is about
ENGLAND

2997 in, and normally diminishes from south-west to north-east at all seasons, the mean pressure on the coast being 29-97 and that on the northern border 29-88. The pressure at any given latitude is normally highest in the centre of the country and on the east coast, and lowest on the west coast and islands. The district, which is an important cause of the sunny weather in all parts of England and Wales must be from the south-west on the west coast, curving gradually until in the centre of the country, and on the east coast it is westerly, without a southerly component. Several of the main pressure systems experience a change, maximum gradient in December and January, and a minimum gradient in April; but for every month in the year the mean gradient is for winds from southerly and westerly quarters.

In April the Easterly dist. is so strong that it is the only fair current to the south of England or any temporary rise of pressure to the north, which we may find in other months merely to reduce the velocity of the south-western wind, is sufficient in that month to reverse the gradient, and permit it to be easterly. The extreme velocity to east winds in spring is one of the most marked features of the English climate, the effect being naturally most felt on the east coast. The southerly component in the wind is as a rule most marked in the westerly component occurring in summer. The west end of a town receives the wind as it blows from the country at all seasons, and consequently the west end of an English town is with few exceptions the residential quarter, while smoke-producing industries are usually relegated to the east.

Storms.—On account of the great frequency of cyclonic disturbances passing in from the Atlantic, the average conditions of wind over the British Islands give no idea of the frequency of change. The west of England is westerly, and the north-westerly over the south-east across England; one track runs across the south-east and south-east counties, and that followed by a large proportion of the summer and autumn storms, therefore, perhaps being of the locality of the storm. The highest pressure is east of England, and the damage from hail accompanying thunderstorms. A second track crosses central England, entering the Severn estuary and leaving by the Humber of the Wash; while a third approaches Thames from the Irish Sea, turning near the mouth to the Tyne. While these are tracks frequently followed by the centres of barometric depressions, individual cyclones may and do cross the country in all directions, though very rarely indeed from east to west or from north to south.

Rainfall.—The rainfall of England, being largely due to passing cyclones, can hardly be expected to show a very close relation to the physical features of the country, yet looked at in a general way the rainfall is as the same as the climate is, not obscure. The western or mountainous division is the wettest at all seasons, each orographic group forming a centre of heavy precipitation. There are few places in the Western Division where the rainfall is less than 35 in., while in Wales, the Cornwall-Devon peninsula, the Lake District and the southern part of the Pennine Region the precipitation exceeds 40 in., and in Wales and the Lake District considerable areas have a rainfall of over 60 in. In the Eastern Counties, rainfall is much less, being as a rule exceeding 30 in. is rare, and in the low ground to the west of the Thames estuary and around the Wash the mean annual rainfall is less than 25 in. In the Western Division and along the south coast the driest months are February or March, May, and August. The wettest month for most parts of England is October, the most noticeable exception being in East Anglia, where, on account of the frequency of summer thunderstorms, July is the month in which most rain falls, although October is far behind. In the Western Division there is a tendency for the annual maximum of rainfall to occur later than October. It may be stated generally that the Western Division is mild and wet in winter, and cool and wet in summer; while the Eastern is cold and dry in winter and spring, and hot and dry in summer and autumn. The south coast occupies an intermediate position between the two as regards climate. Attention has been called to the summer rainfall of the eastern counties, which is the highest in the Western Division. The summer rainfall of the eastern counties is due to the heavy rainfall running off the surface rapidly, while the flat and open clayey lands of the Eastern Division retain the scanty rainfall for a longer time, so that for agricultural purposes the effect of the rainfall is not very dissimilar throughout the country.

Sunshine.—The distribution of sunshine is not yet fully investigated, but it appears that the sunniest part is the extreme south coast, particularly the sands and cliffs of Bognor, which reaches an average of more than 1600 hours. The north-east, including the Pennine Region and the whole of Yorkshire, has less than 1300 hours of sunshine, and a portion of North Wales is equally cloudy. There is a great deal of mystery as to the lack of sunshine on the west coast. If we put down as approximately the average duration of bright sunshine for England as a whole, which may be compared with 2600 hours for Italy, and probably about 1200 hours for Norway.

For the purpose of forecasting the weather, the meteorological office divides England into six districts, which are known as England N.E., Midland Counties, England East, London and Channel, England N.W. and North Wales, and England S.W. and South Wales.

V. ENGLISH PLACE-NAMEs

English place-names are of diverse origin and often extremely corrupt in their modern form, so that the real etymology of the names can often be discovered only by a careful comparison of the modern form with such ancient forms as are to be found in charters, ancient histories, and other early documents. By the aid of these a certain amount of work has been done in the subject, but it is still largely an unworn field. The most satisfactory method of characterizing English place-nomenclature is to deal with it historically and chronologically, showing the influence of the successive nations who have borne sway in this island. The Celtic influence is to be found scattered evenly up and down the country, and the anglo-saxon is confined to the old eastern provinces of England. The name of towns is chiefly confined to the west. Roman influence is slight but evenly distributed. English influence is all-pervading, though in the northern and north-midland counties this influence has been encroached upon by Scandinavian influence. Norman influence is not confined to any particular district.

Celtic.—Though scattered notices of towns, cities and rivers in Britain are to be found in various early Roman writers, it is not till the time of Ptolemy (2nd century), who constructed a map of the island, and the Antonine Itinerary (1663), that we have any information as to the cities and towns of Britain. We there learn that the following place-names are ultimately of Celtic origin:—Brougham, Catterick, York, Lincoln (Lindum), Manchester (Mancunia), Molton, Keswick, Holme (Holm); Lichfield (Letocetum), Gloucester (Glevum), Cirencester (Corinium), Colchester (Camulodunum), London, Reculver, Richborough (Rotaspe), Dover, Lynne, Isle of Wight, Dorchester (Durnovaria). The names which the Saxons have given to the country, are of little use in determining the location of the Roman military stations, but the whereabouts of these are of the utmost importance. We also have the names of the following rivers:—Eden, Dee, Trent, Yare, Colne, Thames, Churne, Exe, Severn, Tamar. Gildas, writing in the 6th century, speaks of the twenty-eight districts of the Britons: Nennius' Historia Brittonum gives us a list of these cities. Of these, excluding Welsh ones, we may perhaps with some certainty identify Canterbury (Canti), Caerleon-on-Usk, Leicester (Lerrion), Penzelwood, Carlisle, Colchester, Grantham, York (Eboracum), Julian (Juliomagus), Wroxeter (Wroxeton), Droitwich (Durobrivae), Wroxeter (G俑ricum), Chester (Legio—this is Roman), Lichfield (Liccestith) and Gloucester (Glocest). Others less certain are Preston-on-Humber and Manchester (Manchiguala).

In Roman place-names the suffix don often goes back to the Celtic dun, e.g. Bredon, Everdon, but the suffix was still a living one in Saxons times. Of river-names the vast majority are Celtic (possible exceptions will be named later), and the same is true of mountains. The foundations of the English counties, districts, the districts of the Wrenk and the Peak are probably Celtic.

Roman.—We do not owe entire place-names to Roman influence, with the exception of a few such as Chester, Chester-le-Street (L. strata), a road-name, and the names of the rivers (O. E. burh, -bourne, -bourne, -burne (O.E. burne, -a, a stream), e.g. Ashbourne, Sherborne, Stockburn; -bridge, e.g. Weybridge, Bridge; -church, e.g. Pucklechurch; -den, -dun, -ton, -ton, -vill, e.g. Bingley, Godlesdon, Rotton Dale, Tadcaster, -thorpe, -thorpe, -thorpe, -bridge, e.g. Tadcaster, Richborough, Wroxeter, Colchester, Melrose, -hurn, -hurn, -hurn, -ile, e.g. Huntingdon, Seckington, Edington, -ey, -eu, -ey (O. E. ian, an island), e.g. Thorney, Mersea, Ely; -flet, e.g. O. E. flet, an estuary), e.g. Benfleck, -folds, e.g. Lichfield, -ford, e.g. Bradford, -ham, e.g. Huntingdon, -hall, -hal, -hath, -hoth (O. E. health, a corner), e.g. Riccall, Tettenhall, -head, e.g. Gatehead, -hill, e.g. Tickhill; -hurst (O. E. hyste, copse, wood), e.g. Wymeswold, -leas, e.g. Perburh; -ling, -ling, -ling, -ly, e.g. Bingley, -low, -low, -low, -low, e.g. Legh, Stoneleigh, Whalley; -ley (O. E. lies, path, course), e.g. Cricklade, -land, e.g. Crowland; -lock (O.E. loca, enclosure), e.g. Porlock, -minster (O. E. mynster, L. monasterium), e.g. Axminster, -mouth, e.g. Exmouth; -port (O. E. port, market-town, a word of Latin
### ENGLAND [POPULATION]

| Origin | e.g., Bridport; -sted, -stead (O.E. stede, a place), e.g., Stansted, Wanstead; -stone, -ston, e.g., Beverstone, Sherston; -staple (O.E. stapl, foundation), e.g., Barmston; stone (O.E. stow, place), e.g., Stow, Chesham, Bristol (earlier Bristow); -tree, -try, e.g., Coventry, Ely, Seesalzter; -ton (O.E. tan, enclosure), e.g., Milton; -worth (O.E. georence, fortification), e.g., Southwark; -will, e.g., Bakewell; -wich, -wick (O.E. wic, a dwelling), e.g., Norwich, Swanage (O.E. Swannawic), Warwick; -worth, -worthy (O.E. weorth, worth, an enclosure), e.g., Polesworth, Holsworthy. Of river names the Blackwater, Witham, Ashburne, Swift, Washburn, Luxley, Wythburn, Eamont are perhaps English and so also may be the Waveney in Suffolk.

**Scandinavian:—** The following suffixes are Scandinavian in origin, some of the names being used independently: -beck (O.N. bekkr, stream), e.g., Starbeck, Troutbeck; -by (O.N. byr, town), e.g., Whitby, -dale (O.N. daalr), e.g., Swaledale; -gang (O.N. gangr), e.g., Redcar, The Carrs, Muker; -fell (O.N. fjäll, mountain), e.g., Yorkshire Dales; -force (O.N. forse, waterfall), High Force, Wilberforce, -grove (O.N. grove, grove), e.g., Wilmslow, Bingley; -head (O.N. head), e.g., Threlkeld, Keld; -hand (O.N. lundr, hand), e.g., Snedall, timberland, -lawn (O.N. laun, lawn), e.g., Greenhow; -scale (O.N. skala, hat, shield), e.g., Seasccale; -skew (O.N. skjör, forest), e.g., Litterskew; -thorpe (O.N. þorp, village), e.g., Thorpe Parva, -thwaite (O.N. thóta, land), e.g., Rosthwaite; -ton (O.N. ton, a green knoll), e.g., Toft, Langtoft; -with (O.N. with, a wood), e.g., Blawith, Stowthwaite.

Tarn (a mountain pool), grain and sike (mountain streams) are also Scandinavian in type.

**Norman:—** Norman influence has not been very great in English place-nomenclature. The number of places with pure French names is extremely limited, a few such are Beaufort, Belvoir, Beauchief, Beaudesert, Beaumont, also Theydon Bois, Warboys. Norman place-names in England show more strongly in certain compound place-names, where one of the elements often represents the name of the original Norman tenant or holder, e.g., Torpe Mandeville, Helion Bumstead, Higham Ferrers, Swaffham Bulbeck, Stoke Gifford, Sheffield Mallet; similarly names like Lyme Regis, Kingston, Monk's Kirby, Zal Monmouth, Milton Abbas, Bishop's Waltham, Prior's Dean, Huish Episcopi date from feudal times. Gallicized forms are also to be found in a few forms like Kirkby-le-Soken, Chapel-en-le-Frith; similar names are used in many other lands, e.g., Rosthwaite; -toft (O.N. toft, a homestead), -ford (O.N. fard), -hanger (O.N. hangare), -how (O.N. how, a creek), -lyd (O.N. lid, a lowlying area), -pool (O.N. pael, a pool), -by (O.N. byr), -by (O.N. byr), -dale (O.N. daalr), -fors (O.N. fór), -head (O.N. head), -how (O.N. how), -thorpe (O.N. þorp, a]   

### VI. POPULATION

Until the beginning of the 19th century there existed no other knowledge of the actual area and population of the country but what was given in the vaguest estimates. But there can be little doubt that the population of England and Wales increased very slowly for centuries, owing largely to want of intercommunication, which led to famines, more or less severe—being a common occurrence that, while one county, with a good harvest, was enjoying abundance, the people of the adjoining ones were starving. The interpretation of certain figures given in the Domesday Survey (which do not cover certain parts of modern England nor take account of the ecclesiastical population) is a matter of widely divergent opinion; but a total population of one million and a half has been accepted by many for the close of the 11th century. In 1377 the levying of a poll-tax provides partial figures from which a total of two to two-and-a-half millions has been deduced, but again divergent views have been expressed as to how far the number was still affected by the Black Death of 1349-1349. It is calculated, partly by means of registers of births and deaths, that the population of England and Wales numbered 5,475,000 in 1700, and 6,470,000 in 1750. From the later part of the 18th century a stronger tendency to increase set in, and at the taking of the first census, in 1801, it was ascertained that the population numbered 8,892,536, being—if the former estimates were approximately correct—an increase of nearly 2½ millions in little over fifty years. This rate of increase was not only continued, but came to be greatly exceeded.

Since the first census of 1801, regular enumerations of the people of England and Wales have been taken every ten years. The results of these enumerations are published in separate volumes for each county, in a volume of summary tables, and in a general report. In the summaries England and Wales are treated as one, and this treatment is followed here. The following table gives the total numbers of the population of England and Wales at each census, with the absolute increase, and growth per cent, during each decennial period:

<table>

</tbody>
</table>

Allowing for a rate of increase equivalent to that which obtained between 1801 and 1901, the estimated population was 34,152,977 in 1905, and 36,169,150 in 1910.

**Distribution:—** A detailed map of the distribution of population in England and Wales shows certain well-defined areas of very dense population. It will be observed that the statistical extent of each is not very large; the map, however, indicates the considerable distance between their residences and their offices. Just as London, in spite of its manifold industrial interests, is hardly to be termed a manufacturing centre, so the populous districts surrounding it is not to be termed a manufacturing district in the sense that term is applied to the remaining regions of dense population which fall for consideration here. London gained its paramount importance from its favourable geographical position in the heart of the country, and the influence of the metropolis, and the populous district of the "home counties" owes its existence to that importance; whereas other populous districts have generally grown up at the point where some source of natural wealth, as coal or iron, lay to hand. The great populous areas which surround south Lancashire and the Adriatic Ridings of Yorkshire, and extends beyond them into Cheshire, Derbyshire, Staffordshire and Nottinghamshire, is not in reality a unit. The whole of the lowland in the south of Lancashire has almost the appearance of one vast town of towns anywhere between the Hills of the Pennine Chain the population crowds the valleys on either flank and leaves in the high-lying centre some of the largest tracts of practically uninhabited country in England. Moreover, the industries in different parts of this area are mostly manufacturing and industrial, and are applied to manufactures, which will be observed in the following, though coal-mining is common to all. The other most extensive centres of dense population are the coal-mining or manufacturing districts of Northumberland and Durham, of the Midlands (partly Warwickshire, Worcestershire and Leicestershire), and of South Wales and Monmouthshire; and it is in these districts, and others smaller, of similar character, that the greatest increase of population has been recorded, since the extensive development of coal-mining.

*As in Bartholomew's Survey Atlas of England and Wales (1903).*
their resources during the 19th century. Thus the preceding counties showed an increase, under normal conditions, exceeding 10% during the ten years 1891-1901, the percentage of increase in 1871-1891 being given for comparison.

It will be observed that three of the home counties occur in the first four in the above list. It is interesting to note, in this connexion, that the increase of population diminished steadily, in the three decades under notice, within the area covered by the administrative county of London, which is only the central part of urban London (compare the population table of the great urban districts, below).

This was 17-44% in 1871-1881, 10-39% in 1881-1891, and 7-3% in 1891-1901. This illustrates the constant tendency for the residential districts of a city to radiate away from its centre, which appears, though in a modified degree, in the case of all the great English cities.

During the period 1891-1901 five English and five Welsh counties showed a decrease per cent in the population. The English counties were:

\[
\begin{array}{|c|c|c|c|}
\hline
\text{County} & \text{1871-1881} & \text{1881-1891} & \text{1891-1901} \\
\hline
\text{Huntingdonshire} & 8-29 & 5-51 & 7-46 \\
\text{Rutland} & 15-33 & 7-33 & 5-59 \\
\text{Westmorland} & 1-21 & +2-99 & +2-99 \\
\text{Oxfordshire} & +1-27 & +3-64 & +1-70 \\
\text{Herefordshire} & 3-26 & 4-02 & 1-62 \\
\hline
\end{array}
\]

The Welsh counties were Montgomeryshire, Cardiganshire, Flintshire, Merionethshire and Brecknockshire, the first-named showing the highest decrease, 5-08% in 1891-1901. These counties are principally agricultural, and it is in agricultural districts where the increase in population through the death rate is greatest. But in 1871-1881 a decrease was found in the case of fifteen counties in all, and in 1881-1891 in the case of thirteen, whereas in 1891-1901, although Radnorshire, which already shows a decrease progressively, now returned an abnormal increase owing to the temporary employment of workmen on the construction of the Birmingham waterworks, the number fell to 10, and the average percentage also fell. This suggested some tendency to return to a state of equilibrium as between urban and rural districts. This is in a measure borne out by the movement of population in the districts classed as purely rural in 1901. In these there was an increase per cent of 14-2 in 1811-1821, which fell off to 2-5 in 1841-1851. A decrease then set in and grew from 0-2 in 1851-1861 to 0-67 in 1861-1871, but in 1871-1881 an increase, 1-95, was once more recorded. But the drain on the rural population continued heavy, for in the purely rural area, which had a population in 1901 of 1,339,309, the excess of births over deaths was 1,437, but the normal increase of population was only 2,562, leaving a heavy loss (9-6%) to be accounted for by migration, the term used in this connexion in the general report of the Census to include movement of population to any new locality, home or foreign.

The table for the urban and rural districts of England and Wales covered by urban districts (a term which comprises pretty nearly with that of towns, which bears no technical meaning in England) was 3,848,957 acres, and contained a population of 25,058,855 in 1901, the increase in the decade 1891-1891 being 15-2%. The number of inhabited houses in the whole country in 1901, namely 9,386,306, may be compared with the numbers in 1811 (3,175,023) and 1851 (3,278,093); it gives an average of 5-2 persons to each house. This average has decreased with some regularity from a maximum of 7-75 in 1821, but there is no certain evidence on which to affirm or deny that the average cubic capacity of dwelling-houses has been maintained. The urban population averaged 5-4 persons to a house, but varied greatly in different counties, an average below 4 being quoted for the whole of Yorkshire, Huddersfield, Hunsford, Yarmouth, Bradford and Stockport, while the average for London was 7-93, and for Gateshead, Newcastle-upon-Tyne and South Shields, in the northern industrial district of the Tyne, and for Devonport, the average exceeded 8. The average of persons to a house in rural districts was 4-6.

**Vital Statistics.** The increase or decrease of population is governed by two factors: (1) the balance between births and deaths, and (2) the change between immigration and emigration. For England, two following table is therefore given to show (1) the percentage of

3 Administrative county.
4 These districts, administratively distinct, belong topographically to Greater London.
in the former and 604.5 in the latter year. The marriage-rate per thousand has ranged since 1841 from 14-2 to 1886 to 17-6 in 1873, and is evidently closely associated with the general prosperity of the country, for in the latter year the value of the total imports and exports per head of the population of the United Kingdom was at its highest, and in the former year at its lowest. The five years 1895-1899 exhibited a remarkable sequence of this:

The marriage-rate declined, subsequently to the year last quoted in this table, to 15.6 in 1903.

Religion.—In attempting to give a concise account of the religious conditions of England we are confronted from the outset with the absence of any trustworthy statistics. A religious census, such as is customary in other countries, has not been taken since 1851; nor is it probable that such a census would be any true indication of the actual religious beliefs of the population. Still less satisfactory, from this standpoint, is the attempt to compile statistics of religious belief from the registrar-general's report on the number of marriages celebrated in the places of worship of the various denominations; for among those who are practically attached to no religious body, and even some Nonconformists, a prejudice survives in favour of having their marriages celebrated and their funerals conducted by the clergy of the Established Church. Nor is the test of "sittings" provided by the various denominations, nor even the number of their communicants, a trustworthy test of the relative number of their adherents. In Wales, for instance, the rivalry of the sects has multiplied chapel accommodation out of all proportion to the population; while everywhere it happens that churches, at one time crowded every Sunday, have been emptied by the shifting of population or other causes. As for the test of communicancy, it is untrustworthy because the insistence on communion as the pledge of membership varies with the different denominations and even with different sections of opinion within those denominations. Any statistics of this nature, then, however useful they may be as a general indication, must not be treated as conclusive.

Whatever disputes there may be as to the relative strength of the various churches and sects, there can be no questioning the fact that the dominant religion in England is Protestant Christianity. Protestantism, indeed, since the Act of Settlement in 1689, has been of the essence of the Constitution, the sovereign forfeiting his or her crown ipso facto by acknowledging the authority of the pope, by accepting "the Romish religion," or by marrying a Roman Catholic; and though of late years efforts have been made to modify or to abrogate this provision, the fact that such efforts have met with widespread opposition shows that it still represents the general attitude of the British nation. Protestantism, however, is a generic term which in England covers a great variety of opinions, and a large number of rival religious organizations. The state church, the Church of England as by law established, represents the tradition of a time when church and state were regarded as two aspects of one divinely ordered organism. In law every subject of the state is also a member of the Established Church, and can lay claim to its ministrations so long as he or she obeys the ecclesiastical law, which is also the law of the state. No Englishman, whatever his opinions, can be excommunicated without due process of law. The Church of England is thus theoretically coextensive with the English nation, each unit of which is legally assumed to belong to it unless proof be brought to the contrary. To state the theory is, however, to risk giving an entirely false impression of the facts. In practice the Church of England is no longer regarded as coextensive with the state; nor is nonconformity any longer, as it once was, an offence against the law. Since the abolition of the Test Acts and the emancipation of the Catholics no Englishman has suffered any civil disability owing to his religious belief. The progress of democracy has given to the great so-called "Free Churches" a political power that rivals that of the Established Church. In the matter of the estimation of their relative strength the main grievance of the Nonconformists is that the law classes as members of the Church of England that enormous floating population which is really conscious of no ecclesiastical allegiance at all.

The Church of England, both in constitution and doctrine, represents in general the mores between Roman Catholicism on the one hand and the more advanced forms of Protestantism on the other (see EPISCOPACY). Though its doctrine was reformed in the 16th century and the spiritual supremacy of the pope was repudiated, the continuity of its organic life was not interrupted, and historically as well as legally it is the same church as that established before the Reformation. The ecclesiastical system is episcopal, the whole of England (including for this purpose Wales) being divided into two provinces, Canterbury and York, and 37 bishoprics (including the primatial sees of Canterbury and York). These again are subdivided into 14,080 parishes (1901), the smallest ecclesiastical units, which are grouped for certain administrative purposes into 810 rural deaneries. The sovereign is by law the supreme governor of the church, both in things spiritual and temporal, and he has the right to nominate to vacant sees. In the case of sees of old foundation this is done by means of the consiglio d'élite (q.v.), in that of others by letters patent.² The bishops hold their temporalities as baronies, for which they do homage in the ancient form, and are spiritual peers of parliament. Only 26, however, have the right to seats in the House of Lords, of whom five—viz. the two archbishops and the bishops of London, Durham and Winchester—always sit, the others taking their seats in order of seniority of consecration. Under the bishops the affairs of the dioceses are managed by archdeacons (q.v.) and rural deans (see ARCHDEACON and DEAN). The cathedral churches are governed by chapters consisting of a dean, canons and prebendaries (see CATHEDRAL). The deaneries are in the gift of the crown, canonicities and prebends sometimes in that of the crown, sometimes in that of the bishops. The parish clergy, with a few rare exceptions (when they are elected by the ratepayers), are appointed by patronage. The right of presentation to some 8500 benefices or "livings" is in the hands of private persons; the right is regarded in law as property and is, under certain restrictions for the avoidance of gross simony, saleable (see ANNUITY). The patronage of the remaining benefices belongs in the main to the crown, the bishops and cathedral chapters, the lord chancellor, and the universities of Oxford and Cambridge. Despite the fact that the Church of England is collectively one of the wealthiest in Christendom, a large proportion of the "livings" are extremely poor. To understand this and other anomalies it is necessary to bear in mind that the church is not, like the established Protestant churches of Germany, an elaborately organized state department, nor is it a single corporation with power to regulate its internal polity. It is a conglomeration of corporations. Even the incumbent of a parish is in law a "corporation sole," his benefice a freehold; and until the establishment in 1836, by act of parliament, of the Ecclesiastical Commissioners (q.v.) nothing could be done to adjust the inequalities in the emoluments of the clergy resulting from the natural rise and fall of the value of property in various parts of the country. Even more extraordinary is the effect of the singular constitution of the church on its discipline. An incumbent, once inducted, can only be disturbed by complicated and extremely costly processes of law; in effect, except in cases of gross

1 Certain great offices of state are closed to Roman Catholics.
2 The actual selection of the bishops is in practice in the hands of the prime minister for the time being. This formerly led to purely political appointments; but it is usual now to select clergymen approved by public opinion.
misconduct, he is only checked — so far as ecclesiastical order is concerned — by his oath of canonical obedience to the “godly” monitions of his bishop; and, since these monitions are difficult and costly to enforce, while their “godliness” may be a matter of opinion, an incumbent is practically himself the interpreter of the law as applied to the doctrine and ritual of his particular church. The result has been the development within the Established Church of a most startling variety of doctrine and ritual practice, varying from what closely resembles that of the Church of Rome to the broadest Liberalism and the extreme evangelical Protestantism. This broad comprehensiveness, which to outsiders looks like ecclesiastical anarchy, is the characteristic note of the Church of England; it may be, and has been, defended as consonant with Christian charity and suited to the genius of a people not remarkable for logical consistency; but it makes it all the more difficult to say what the religion of Englishmen actually is, even within the English Church.

The following is a list of the archiepiscopal and episcopal sees of England and Wales — the latter arranged in alphabetical order — with date of their establishment and amount of emoluments:

</table>

The number of “denominations” by whom buildings were certified for worship up to 1895 was 203 (see list in Whittaker’s Almanack, 1896, p. 252), but in many instances such “denominations” consisted of two or three congregations only, in some cases of a single congregation. The more important nonconformist churches are fully dealt with under their several headings. The above table, however, based on that in the STATESMAN’S YEAR-BOOK for 1908, and giving the comparative statistics of the chief nonconformist churches, may be useful for purposes of comparison. It may be prefaced by stating that, according to returns made in 1905, the Church of England provided sitting accommodation in parish and other churches for 7,177,144 people, and that an estimated number of 2,053,455 communicants, 2,053,455 Sunday-school teachers, and 2,053,455 Sunday scholars. There were 14,029 incumbents (rectors, vicars, and perpetual curates), 7,000 curates, i.e., assistant clergy, and some 4,000 clergy on the non-active list.

Besides the bodies enumerated in the table there are other churches concerning which similar statistics are lacking, but which, in several cases, have large numbers of adherents. The Unitarians are an important body with (1908) 350 ministers and 345 places of worship. Most numerous, probably, are the adherents of the Salvation Army, which with a semi-military organization has in Great Britain alone over 60,000 officers, and “barracks,” i.e., preaching stations, in almost every town. The Brethren, generally known, from their place of origin, as the Plymouth Brethren, have “rooms” and adherents throughout England; the Catholic Apostolic Church (“Irvingites”) have some 80 churches; the New Jerusalem Church (Swedenborgians) had (1868) 75 “societies”; the Christian Scientists, the Christadelphians, the British Israelites and similar societies, such as the New and Latter House of Israel, the Seventh Day Baptists, deserve mention. The Latter Day Saints (Mormons) had (1908) 82 churches in Great Britain.

Roman Catholicism in England has shown a tendency to advance, especially among the upper and upper-middle classes. The published list of “converts” are, however, no safe index to actual progress; for no equivalent statistics are available for “leakage” in the opposite direction. The membership of the Roman Catholic Church in England is estimated at about 2,000,000. But though the

The following are suffragan or assistant bishoprics (the names of the dioceses to which each belongs being given in brackets): Dover, Croydon (Canterbury), Beverley, Hull, Sheffield (York), Stepney, Islington, Kensington (London), Jarrow (Durham), Guildford, Southampton, Dorking (Winchester), Barrow-in-Furness (Carlisle), Crediton (Exeter), Grantham (Lincoln),

1 Modern reorganization.
growth of the church relatively to the population has not been particularly startling, there can be no doubt that, since the restoration of the Roman Catholic hierarchy in 1851, its general political and religious influence has enormously increased. A notable feature in this has been the great development of monastic institutions, due in large measure to the settlement in England of the congregations expelled from France. The Roman Catholic Church in England is organized in 15 dioceses, which are united in a single province under the primacy of the archbishop of Westminster. In December 1907 there were 1736 Roman Catholic churches and stations, and the number of the clergy was returned at 3524 (see Roman Catholic Church).

The Jews in Great Britain, chiefly found in London and other great towns, number (1907) about 106,000 and have some 200 synagogues; at the head of their organization is a chief Rabbi resident in London.

Finally it may be mentioned that a small number of Englishmen, chiefly resident in Liverpool and London, have embraced Islam; they have a mosque at Liverpool. Various foreign churches which have numbers of adherents settled in England have also branch churches and organizations in the country, notably the Orthodox Eastern Church,—with a considerable number of adherents in London, Liverpool and Manchester, the Lutheran, and the Armenian churches.

VII. Communications

Roads.—In England and Wales the high-roads, or roads on which wheeled vehicles can travel, are of two classes: (1) the main roads, or great arteries along which the main vehicular traffic of the country passes; and (2) ordinary highways, which are by-roads serving only local areas. The length of the main roads is about 22,000 m., and of ordinary highways about 96,000. The highways of England, the old coaching roads, are among the best in the world, being generally of a beautiful smoothness and well maintained; they vary, naturally, in different districts, but in many even the local roads are superior to some main roads in other countries. The supersession of the stage coach by the railway took a vast amount of traffic away from the main roads, but their proper maintenance did not materially suffer; and a larger accession of traffic took place subsequently on the development of the cycle and the motor-vehicle.

The system of road-building by private enterprise, the undertakers being rewarded by tolls levied from vehicles, persons or animals using the roads, was established in England in 1663, when an act of Charles II. authorized the taking of such tolls at "turnpikes" in Hertfordshire and Cambridgeshire. A century later, in 1767, the authorization was extended over the whole kingdom by an act of George III. In its fulness the system lasted just sixty years, for the first breach in it was made by an act of George IV., in 1827, by which the chief turnpikes in London were abolished. Further acts followed in the same direction, leading to the gradual extinction, by due compensation of the persons interested, of the old system, the maintenance of the roads being vested in "turnpike trusts and highway boards," empowered to levy local rates. The last turnpike trust ceased to exist on the 5th of November 1895, and the final accounts in connexion with its debt were closed in 1898–1899. Toll-gates are now met with only at certain bridges, where the right to levy tolls is statutory or by prescription. By the Local Government Act of 1888 the duty of maintaining main roads was imposed on the county councils, but these bodies were enabled to make arrangements with the respective highway authorities for their repair. Under the Local Government Act of 1894 the duties of all the highways began to be transferred to the local district councils on or before the 21st of March 1899.

It was not until the close of the 18th century, that the period of road-building activity already indicated set in, that English roads were redeemed from an extraordinarily bad condition. The roads were until then, as a rule, merely tracks, deeply worn by ages of traffic into the semblance of ditches, and, under adverse weather conditions, impassable. Travellers also had the risk of assault by robbers and highwaymen. As early as 1859 a law provided for the cutting down of trees and bushes on either side of highways, so as to deprive lawless men of cover. By 1800 the roads were marked up, and as the upkeep of roads are recorded from time to time after this date, but (to take a single illustration) even in the middle of the 18th century the journey from the village, as it was then, of Paddington to London by stage occupied from 2½ to 3 hours. But from 1784 to 1792 upwards of 300 acts were passed dealing with the construction of new roads and bridges.

Railways.—The history and development of railways in England, their birthplace, and in Ireland and Scotland, with illustrative statistics, are considered under the heading United Kingdom. The following list indicates the year of foundation, termini, chief offices and geographical sphere of the chief railways of England and Wales.

1. Railways with Termini in London.

(a) Northern.

Great Northern (1846).—Terminus and offices, King's Cross. Main line—Peterborough, Grantham, Newark, Doncaster, forming, with the North-Eastern and North British lines, the "East Coast" route to Scotland. Serving also the West Riding of Yorkshire, Lincolnshire, Nottingham and other towns of the Midlands, and Manchester (by running powers over the Great Central metals). This company has so extensive a system of running powers over other railways, and of lines held jointly with other companies, that few of its more important express trains from London complete their journeys entirely on the company's own lines.

Midland (1844, an amalgamation of the former North Midland, Midland Counties, Birmingham & Derby, and other lines).—Terminus, St Pancras. (Other offices, Derby, Main line—Bedford, Leicester, Sheffield, and Carlisle, affording the "Midland" route to Scotland. Serving also Nottingham, Derby, and the principal towns of the Midlands and West Riding, and Manchester. West and North line (1846) to London & Liverpool Railway, and the Great Northern Railway; also an Irish section, the Belfast and Northern Counties system being acquired in 1903. Docks at Heysham, Lancashire; and steamship services to Belfast, &c.

London & North-Western (1846, an amalgamation of the London & Birmingham, Grand Junction and Manchester & Birmingham lines).—Terminus and offices, Euston. Main line—Rugby, Crewe, Warrington, Preston, Carlisle; forming, with the Caledonian system, the "West Coast" route to Scotland. Serves also Manchester, Liverpool and all parts of the north-west, North Wales, Birmingham and the neighbouring midland towns, and by jointlines, the South Welsh coal-fields. Maintains docks at Garston on the Mersey, a steamship traffic with Dublin and Greenore from Howth, and joint lines with West & Yorkshire Company, a service to Belfast, &c., from Fleetwood.

Great Central (1846; until 1897, when an extension to London was undertaken, called the Manchester, Sheffield & Lincolnshire).—Terminuses, Manchester, Glasgow, Rugby, Nottingham, Leicester, Sheffield, Manchester. The former line runs from Manchester and Sheffield west to Rotherford, thence serving Grimsby and Hull, with branches to Lincoln, &c. The main line reached from London by joining the line of the Metropolitan railway near Aylesbury and following it to Harrow and beyond, at Oxford, Birmingham, Shrewsbury, Chester with connections northward, and to North Wales; Oxford to Worcester, and Swindon.

(b) Eastern.

Great Eastern (1862).—Terminus and offices, Liverpool Street. Serving Essex, Suffolk, Cambridgeshire, Norfolk, &c.; joining the Great Northern at Hornsey, and the Great North of Scotland at Redesdale. Passenger steamship services from Harwich to the Hook of Holland, Antwerp, Rotterdam, &c.

London, Tilbury & Southend (1852).—Terminus and offices, Pierhead Street. Serving places on the Essex shore of the Thames estuary, terminating at Shoeburyness.

(c) Western.

Great Western (1835, London to Bristol).—Terminus and offices, Paddington. Main line—Reading, Didcot, Swindon, Bath, Bristol, Taunton, Exeter, Plymouth, Penzance. Numerous additional main lines—Reading to Newbury, Weymouth and the west, a new line opened in 1906 between Castle Cary and Langport effecting a great reduction in mileage between London and Exeter and places beyond. East South-Western Railway, forming the Union of the London and South Western and Great Western railways at Paddington, joins the Great Western line at Swindon.
to Gloucester and the west of England; South Welsh system (through route from London via Wootton Bassett or via Bristol, and the Severn tunnel), Newport, Cardiff, Swansea, Milford. Steamship services to the Channel Islands from Weymouth to Waterford, Ireland from Milford and Bournemouth, Ireland, from Fishguard, the route last named being opened in 1866. The line constructed jointly with the Great Central Company (as detailed in the description above) was extended in 1910 from Ashendon to Aynho, to form a short route to the great centres north of Oxford.

---

COMMUNICATIONS

ENGLAND

SECTION 1.

1. Integrated Systems and Services

(a) Viaduct, Chesterdale, North Western (Aberystwyth). Maintains Portsmouth, a junction line connecting Cheltenham on the north-western line of the Midland with Andover Junction on the South-Western line; and (b) by the Somerset & Dorset line, connecting the same lines between Bath, Templecombe and Bournemouth.

---

2. Inland Navigation

The English system of inland navigation is confined principally to the following districts: South Lancashire, the Victoria & Mersey, the Great West of York, the Great Eastern, and the Grand Western canals and rivers.

---

3. Joint Services

Some canals and river navigations have consequently become derelict, or have entirely multiplied of the navigation systems. This is the purpose of drainage or water-supply, and must have been used for navigation at an early period. But the history of canal-building in England is usually dated from about 1790, and from the construction, at the instance of Francis, Duke of Bridgewater, of the Bridgewater canal in South Lancashire, now belonging to the Manchester Ship Canal Company. The activity in canal-building which prevailed during the later years of the 18th century, with the first counterpart of the first railway development, which, provided with a number of canals, was called the Great Western, or the South-Western Company, after a corresponding line on the way, through Tottenham and North-western line. Inland navigation systems generally have provision made, as it has in the case of railways, for such facilities as the working of traffic which can be and services which have been acquired control of about 30% of the total mileage of canals in England and the alternative, of which many has had a prejudicial effect on the prosperity of canals.

---

4. Provincial Railways

The two most important railway companies not possessing lines to London are the North-Eastern and the Lancashire & Yorkshire. The Great North Western Company (a) through the line from South Lancashire, and the Great Northern from South Yorkshire, and South Lancashire and the West Riding of Yorkshire are traversed and connected by several canals following transverse valleys of the Pennine Chain. The main line of the Aire and Calder navigation is followed by the railway companies. For certain classes of goods, carriage is cheaper than the greater numbers of goods, but the railways are used. The lines are as a rule, a number of canals, including the Canal, from which, at Berwick on Tweed, the Northumberland and the River Tweed, and through the Potteries, to the Bridgewater Canal and so to the Mersey. This can be the principal residence of the English rivers as the Thames, Tyne, Humber, Mersey and Bristol Avon, are among the most important waterways in the world, including access for seaborne traffic to great ports. From the Mersey the Manchester Ship Canal Company and from the Thames, the Great Eastern navigation system at are marine courses of some of the English rivers. The canal's connection with the River Tweed is an extensive navigation, which, from which, at Berwick, the Trent and Mersey Canal runs near Burton and Stafford, and the 'Canals' Fens' are depicted on the map.
Oversea Communications.—The chief ports for continental passenger traffic are as follows:—

Harwich to Amsterdam, Antwerp, Hamburg, Hook of Holland, Rotterdam (Great Eastern railway); to Copenhagen and Esbjerg (Roskilde, Danish line, and Danish mail steamers).

Queensborough to Flushing (Zeeiland Steamship company).

Dover to Calais (South-Eastern & Chatham railway); to Ostend (Belgian Royal mail steamers).

Folkestone to Boulogne (South Eastern & Chatham railway).

Newhaven to Dieppe (London, Brighton & South Coast railway).

Southampton to Cherbourg, Havre, St Malo (South-Western railway).

The chief ports for trans-Atlantic traffic are Liverpool and Southampton, and special trains are worked in connexion with the steamers to and from London. The great development of harbour accommodation at Dover early in the 20th century brought trans-Atlantic traffic to that port, and Liverpool are the two greatest English ports for all oceanic passenger traffic; but London has also a large traffic, both to European and to foreign ports. The passenger traffic to the Norwegian ports, always very heavy in summer, is carried chiefly from Hull and Newcastle.

VIII. INDUSTRIES

Agriculture.—In the agricultural returns for Great Britain, issued annually by the government, the area of England (apart from Wales) has been divided into two sections, “arable” and “grass,” corresponding with a former division into “corn counties” and “grazing counties,” except that Leicestershire is included not in the “grass” but in the “arable” section. Most of the eastern part of England is “arable,” while the western and northern part is “grass,” the boundary between the sections being the western limit of Hampshire, Berkshire, Oxfordshire, Warwickshire, Leicestershire, Nottinghamshire, and of the East Riding of Yorkshire.

The division is thus as follows:

<table>
<thead>

</table>

The average area under cultivation of all the counties is about 75% of the whole area. The counties having the greatest area under cultivation (ranging up to about one-tenth of the whole) may be taken as the chief agricultural counties of England, viz. Lincolnshire, Huntingdonshire, Rutland, Northamptonshire, Bedfordshire and Cambridgeshire. Those with the smallest proportion of cultivated area are Westmorland, Middlesex, Northumberland, Surrey, Cumberland, North Riding of Yorkshire, Lancashire, Durham, and Cornwall. Geographical considerations govern these conditions to a very great extent; thus the counties first indicated lie almost entirely within the area of the low-lying and fertile Eastern Plain, while the smallest areas of cultivation are found in the counties covering the Pennine hill-system, with its high-lying uncultivated moors. In the case of Cornwall and Cumberland the physical conditions are similar to these; but in that of Middlesex and Surrey the existence of the large urban areas belonging adjacent to London must be taken into account. These also affect the proportion of cultivated areas in the other home counties. The presence of a widespread urban population must also be remembered in the case of Lancashire and Yorkshire. The West Riding of Yorkshire and the South Riding of Yorkshire produce a notable quantity of barley and oats; and the oat-crops in the following counties deserve mention—Devonshire, Hampshire, Lancashire, Cumberland, Cornwall, Cheshire and Sussex. There is no county, however, in which the single crop of wheat or barley stands pre-eminent above others, and in the case of the upland counties of Cumberland and Westmorland and Berwickshire the proportions are quite insignificant. In proportion to their area, the counties specifically productive of wheat are Cambridgeshire, Huntingdonshire, Hertfordshire, Yorkshire, Lincolnshire, and of barley, Norfolk, Suffolk and the East Riding of Yorkshire. The chief place, but a good quantity is grown in Cambridgeshire, Norfolk and Essex, in Worcestershire and other western counties, where, considering the fruit-growing in the country, and the suitability of the soils, the East Riding of Yorkshire, with the exception of the East Riding of Yorkshire, with the exception of the

Woodlands.

...
FISHERIES

Fisheries.—All the sea coast of Britain are rich in fish, and there are important fishing stations at intervals on all the English coasts, but those on the east coast are by far the most numerous.

On an estimate of weight and value of the fish landed, Grimsby at the mouth of the Humber in Lincolnshire, stands pre-eminent, and is considered the chief port. For example, there was landed at Grimsby of nearly four times the value of those landed at Hull, which was the second in order of all the English stations.

Next in importance stand Lowestoft, Yarmouth and North Shields, Boston and Scarborough, and among the large number of fishing ports and Ramsgate. Great quantities of fish are also landed at the riverside market of Billingsgate in London, but the conditions here are exceptional, the landings being effected by carrier steamers, plying from certain ports, and not taken through the coasting trade for fishing.

On the south coast Newlyn ranks in the same category with Boston; at Plymouth considerable catches are landed; and Brixham ranks alongside the last ports named on the east coast. The chief fishing centres of the English coast are thus seen to belong to the coast of Devonshire and Cornwall. On the west coast the Welsh port of Milford takes the first place, while Swansea and Cardiff have a considerable fishing industry, surpassed, however, by that of Fleetwood in Lancashire. Liverpool also ranks among the more important centres, and a comparison of the production of the east, south and west coast fisheries, an average may be taken of the annual catches recorded over a term of years. In the ten years 1894-1903, this average was 6,985,580 cwt. for the east coast stations, 2,795,890 cwt. for South coast, and 884,930 for those of the west (including the Welsh stations).

Distinctions may be drawn, as will be seen, between the nature and methods of the fisheries on the various coast lines, so that the per capita and personal productivity of the industry from year to year cannot be considered as a whole. Thus in the period considered the recorded maximum weight of fish landed at the east coast ports was 9,539,114 cwt. in 1903 (the value being as £5,721,105); whereas the south coast ports, in 1902-3, returned 1,171,164 cwt. in 1898. Considered as a whole, the individual fish, by far the most important in the English fisheries, is the herring, for which Yarmouth and Lowestoft are the chief ports. The next in order are the plaice and sole and place, and the whole coast of these return the greatest bulk of these also. But whereas the south coast has the advantage over the west in the herring and plaice fisheries, the reverse is the case in the haddock and cod fisheries, haddock, in particular, being landed in large quantities at the south coast ports. Mackerel, however, are landed principally at the southern ports, and the pilchard is taken almost solely off the south-west coast. A fish of special importance to the west coast fisheries is the hake. Among shell-fish, crabs and eel are gathered in the coast waters; rough eel beds are also much frequented by the oyster beds in the shallow water off the north Kent and Essex coasts, as at Whitstable and Colchester, being famous. Lobsters are landed in greatest number on the south coast.

The number of vessels of every sort employed in fishing was returned in 1903 as 9,721, and the number of persons employed as 41,539, of whom 34,071 were regular fishermen. The development of the steam trawling-vessel is illustrated by the increase in numbers of these vessels, which in 1893 was as 135:1; in 1903 there were chiefly to North Shields, Hull, Grimsby, Yarmouth and Lowestoft.

There are considerable number on the west coast, but very few on the south. These vessels have a wide range of operations, pursuing their work as far as the Faeroe Islands and Iceland support the one, and the Bay of Biscay and the Portuguese coast on the other.

The English freshwater fisheries are not of great commercial importance, nor, from the point of view of sport, are they comparable with those of Scotland, Ireland or Wales. The English salmon and trout fisheries may be geographically classified thus:

- (1) North-western division, Rivers Eden, Lune, and Upper Lune.
- (2) Western, Dee, Ure, Wye, Severn.
- (3) South-western, Taw, Torridge, Camel, Tamar, Dart, Exe, Teign, &c.
- (4) Southern, Avon and Stour (Christchurch) and the Itchen and other famous trout streams of Hampshire.
- (5) Eastern, Fowey, Lea and East Anglian.

The ports are low-water ports, though the Trent carries a few, and in modern times attempts have been made to rehabilitate the Thames as a salmon river. The trout-fishing in the upper Thames and many of its tributaries is still a fair remuneration sport. But in the midland, eastern and south-eastern rivers, the Norfolk Broads, &c., are noted for their coarse fish.

Mining.—Although the conditions of mining have, naturally, undergone a revolutionary development in recent times, the resources of England's mineral wealth are found at various periods of early history. The exploitation of tin in the south-west is commonly referred back to the time of the Phoenician sea-traders, and in the first half of the 13th century England supplied Europe with this metal. At a later period tin and lead were regarded as the English minerals of highest commercial value; whereas to-day, both, but especially lead, have fallen far from this position. The Roman working of lead and iron has been clearly traced in many districts, as has that of salt in Cheshire. The subsequent development of the iron industry is full of interest, as, while extending vastly, it has entirely lapsed in certain districts. However long before it may have been known to a few, the use of coal for smelting iron did not become general until the 18th century, and down to that time, iron-working was confined to districts where timber was available for the supply of the smelting medium, charcoal. Thus the industry centred chiefly upon the Weald (Sussex and Kent), the Newcastle-upon-Tyne, and the Birmingham district; but from the first district named it afterwards wholly departed, following the development of the coal-fields. These have, in some cases, a record from a fairly early date; thus, an indication of the Northumberland coal-supply occurs in a charter of 1285, and the famous coal-fields of the North-east are mentioned early in the following century. But how little this source of wealth was developed appears from an estimate of the total production of coal, which gives in 1700 only 2,612,000 tons, and, in 1800, 10,080,000 tons, against the returned total for the United Kingdom of 225,181,320 in 1900.

The chief minerals raised in England, as stated in the annual home office report on mines and quarries, appear in order of importance, thus: coal, iron ore, clay and shale, sandstone, limestone, igneous, etc. In the south-east all these minerals are found; and in many places, coal is so close to the surface that it can be mined on the top of the hills. In other places the coal is deep below the surface, and the coal-mine is merely a tunnel driven down to the coal seam. The first type of coal is called surface coal, and the second is called deep coal. The latter is the more common type in England.

The coal-fields of the eastern flank of the Pennine system, therefore, the Northern and the Yorkshire, are seen to be far the most important in England. The carrying trade in coal is naturally very extensive, and may be considered here. The principal port for the shipping of coal for export, set down in order of the amount shipped, also fall very nearly into topographical groups, thus:

- Newcastle, South Shields and Blyth in the Northern District.
- Newmarket in Monmouthshire, Staffordshire and the North-Western District.
- Grimsby and Goole on the Humber, which forms the eastern outlet of the Yorkshire coal-fields; Hartlepool, in the Northern District, and Liverpool. The tonnage annually shipped ranges from about 45 million tons of coal, sent by the railway companies to Liverpool; but the export trade of Cardiff in South Wales far surpasses that of any English port, being more than three times that of Newcastle in 1903.

The north-west coast of the country is also important for coal, especially the Fells, and the Lanarkshire coal-field is the most important in the country. The coal-fields of Scotland are divided into two main divisions: the Eastern and the Western. The Eastern division includes the Fife and the Lothian coal-fields, which are both important. The Western division includes the Lanarkshire coal-field, which is the largest in Scotland. The coal-field of Lanarkshire is the most important, as it is the largest and the most productive. The coal-field of Lanarkshire is the most important, as it is the largest and the most productive. The coal-field of Lanarkshire is the most important, as it is the largest and the most productive. The coal-field of Lanarkshire is the most important, as it is the largest and the most productive.
and South Welsh districts; the Great Western and the Taff Vale (South Welsh), with the Great Central, Lancashire & Yorkshire and Great Northern systems.

In the face of railway competition, several of the canals maintain a fair traffic in coal, for which they are eminently suitable tonnage. The canals of the Birmingham navigation, the Aire and Calder navigation of Yorkshire, and the Leeds and Liverpool navigation have the largest shares in this trade.

The richest iron-mining district in England and in the United Kingdom is the Cheshire district of the North Riding of Yorkshire. It produces over two-fifths of the total amount of ore raised in the Kingdom, and not much less than one-half of that raised in England. The richness of the ore (about 30% of metal) is more than in the great iron mines of the Cumberland and north Lancashire (Furness district, &c.). Here the percentage is over 50, but the ore, though the richest found in the kingdom, is less plentiful, about 1.4 million tons being raised in 1903 as against more than 3.5 million tons. The iron is the fiercest, and is sideritized by a deposit of iron ore at various points in Lincolnshire, Northamptonshire and Leicestershire; with further workings of less importance in Staffordshire and several other districts. The total amount of ore raised in England is about 1.2 million tons, but it is not so high. Cleveland and Furness, as formerly. Some of the lesser deposits have been worked out, and even in the rich Furness fields it has been found difficult to pursue the ore. The import of ore (the bulk coming from Spain) has consequently increased, and the port of Liverpool has become the leading one for the import of iron. Coinciding with the production of copper is a lapping industry, confined to Cornwall. For the production of lead the principal counties are Derbyshire, Durham and Stanhope, but the industry is not extensive, and is confined to a few districts. It is found in each of the former counties. Clay and sommenite is general in most parts. For limestone the principal localities are in Durham, Derbyshire and Yorkshire, while for chalk-quarrying Kent is pre-eminent among a group of south-eastern counties, including Hampshire and Essex. Some of the iron ores of Derbyshire are raised from coal-mines, while, among special clays, there is a considerable production of china and potter’s clays in Cornwall, Devonshire and Dorsetshire. As regards igneous rocks, the Charnwood Forest quarries of Leicestershire, and those of the Cleveland and Furness districts, are particularly noticed for their granite. Slate is worked in Cornwall and Devon, and also in Lancashire and Cumberland, where, in the Lake District, there are several large quarries. Salt, obtained principally from brine but also as rock-salt, is an important object. Fireclay is largely raised from that country and Staffordshire exceeding a million tons annually. In Worcestershire, Durham and Yorkshire salt is also produced from brine.

The total number of persons in any way occupied in connexion with mining is a particularly important trade in coal, with 258,474 in 1881, the number being found to increase rapidly, as from 328,474 in 1881. Coal-mines alone occupied 643,654, and to develop in this direction the total increase is chiefly due. The number of ironstone and other mines decreased in the period noticed from 55,907 to 31,608.

Manufacturing Industries.—There are of course a great number of important industries which have a general distribution throughout the country, being more or less fully developed here or there in accordance with the requirements of each locality. But in specifying the principal industries of any county, it is natural to consider those which have an influence more than local on its prosperity. In England, then, two broad classes of industry may be taken up for primary consideration—the textile and the metal. Long after textile and other industries had been flourishing in the leading states of the continent, in the Netherlands, Flanders and France, England remained, as a whole, an agricultural and pastoral country, content to export its wealth in wool, and to import them again, greatly enhanced in value, as clothing. It is not to be understood that there were no manufacturing industries whatever. Rough cloth, for example, was manufactured for home consumption. But from Norman times the introduction of foreign artisans, capable of establishing industries which should produce goods for distant sale, occupied the attention of successive rulers. The plantation of Flemish weavers in East Anglia, especially at the towns of Yarmouth (to which is attributed the derivation of the word Yarmouth) and Norwich, dates from the 12th century. The industry, changing locality, like many others, in sympathy with the changes in modern conditions, has long been practically extinct in this district. Then, when religious persecution drove many of the industrial population of the west of Europe away from the homes of their birth, they liberally repaid English hospitality by establishing their own arts in the country, and attaching them to the inhabitants. Thus religious liberty formed part of the foundation of England's industrial greatness. Then came the material agent, machinery propelled by steam. The invention of the steam engine, following quickly upon that of the carding machine, the spinning jenny, and other ingenious machinery employed in textile manufactures, gave an extraordinary impulse to their development, and, with them, that of kindred branches of industry. At the basis of all of them was England's wealth in coal. The vast development of industries in England during the 19th century may be further correlated with certain events in the general history of the time. Insular England was not affected by the disturbing influences of the Napoleonic period in any such degree as was continental Europe. Such conditions carried on the work of British inventors in helping to develop industries so strongly that manufacturers were able to take full advantage of the opportunities offered by the American Civil War (in spite of the temporary disability it entailed upon the cotton industry) and by the Franco-German War. These wars tended to paralyse industries in other countries affected, which were thus thrown open to English markets to buy manufactured commodities. That England, not possessing the raw material, had become the seat of the cotton manufacture, was equally owing to the ingenuity of her inventors. It was not till the latter part of the 18th century, when a series of inventions, unparalleled in the annals of industry, followed each other in quick succession, that the cotton manufacture took real root in the country, gradually eclipsing that of other European nations, although a linen manufacture in Lancashire had acquired some prominence as early as the 16th century. But though the superior excellence of their machinery enabled Englishmen to start in the race of competition, it was the discovery of the new motive power, drawn from coal, which made them win the race. In 1815 the total quantity of raw cotton imported into the United Kingdom was not more than 90 million pounds, which amount had increased to 172 millions of pounds in 1820, and rose further to 289 millions in 1825, so that there was considerably more than a doubling of the imports in ten years.

The geographical analysis of the cotton industry in England is simple. It belongs to the great industrial towns in its neighbourhood.

Textiles. —The industry has extended into the adjacent parts of Cheshire, the West Riding of Yorkshire and Derbyshire. The immediate neighbourhood of Manchester as the great manufacturing centre, the cotton industry, like others; and the manufacture to a moist climate, such as is found on the western slope of the Pennines (in contradiction to the east), must also be considered. The excess of the demand of the factories over the raw materials has become a remarkable feature of the industry in modern times.

The distribution of the woollen industries peculiarly illustrates the changes which have taken place since the early establishment of manufacturing industries. As Kent is the chief industry, an example has been seen how completely the industry has forsaken East Anglia. Similarly, this industry was of early importance along the line of the Cottswold Hills, from Chipping Camden to Stroud and beyond, as also in some towns of Devonshire. It was the fashion of Devonshire weavers in the neighbourhood of Stroud, the importance of this district is far surpassed by that of the West Riding of Yorkshire, where the woolen industry stands pre-eminent among the many which, as already indicated, constituted the cotton industry. This district has in its north-western extent from Lancashire into the West Riding, so that the woollen from the West Riding into a few Lancastrian towns, such as Rochdale. Among other textile industries attaching to definite localities may be mentioned those of the eastern Staffordshire and Cheshire districts, and in the counties of Congleton and Macclesfield; and the hosiery and lace manufactures of Nottinghamshire, Derbyshire and Leicestershire.

The metal-working industries also follow a geographical distribution mainly governed by the incidence of the coal-fields, as well as by that of the chief districts for the production of iron-ore already indicated, such as the Cleveland and Durham and the Furness districts. But the district is not intimately connected with every branch of this industry, from engineering and the manufacture of tools, &c., to working in the precious metals, is the "Black Country" and Birmingham district of Staffordshire, Warwickshire and Worcestershire. Apart from the district, large quantities of iron and steel are produced in the manufacturing areas of Lancashire and the West Riding of Yorkshire,
and here, as in the Black Country, are found certain centres especially noted for the production of an individual class of goods, such as Sheffield for its cutlery. There is, further, a large engineering industry in the London district; and important manufactures of agricultural implements are found at many towns of East Anglia and in other agricultural localities. Birmingham and Coventry may be specially mentioned as centres of the motor and cycle building industry. The establishment of their engineering and other workshops at certain centres by the great railway companies has important bearing on the concentration of urban population. For example, by this means the London & North Western and the Great Western companies have created large towns in Crewe and Swindon respectively.

Certain other important industries may be localized. Thus, the manufacture of china and pottery, although widespread, is primarily identified with Staffordshire, where an area comprising Stoke and a number of contiguous villages actually bears the name of the Potteries (q.v.). Derby has a similar fame, while the manufacture of glass, important in Leeds and elsewhere in the West Riding of Yorkshire, and in the London district, centres peculiarly upon a single town in South Lancashire—St Helens. Finally, the bootmakers of Northamptonshire (at Wellingborough, Rushden, &c.), and the straw-platers of Bedfordshire (at Luton and Dunstable), desire mention among localized industrial communities.

**Occupations of the People.**—The occupations of the people may be so considered as to afford a conception of the relative extent of the industries already noticed, and their importance in relation to other occupations. The figures to be given are those of the census of 1901, and embrace males and females of 10 years of age and upwards. The textile manufactures occupied a total of 904,668 persons, of which the cotton industry occupied 570,131. A high proportion of female labour is characteristic of each branch of this industry, the number of females employed being about half as many again as that of males (the proportion was 1.47 to 1 in 1901). The metal industries of every sort occupied 1,116,202, out of which those employed in engineering (including the building of all sorts of vehicles) numbered 741,346. Of the other broad classes of industry already indicated, the manufacture of boots and shoes occupied 229,257, and the pottery and glass manufactures 90,193. For the rest, the numbers of persons occupied in agriculture has been quoted as 1,192,167; and of those occupied in mining as 805,185. Among occupations not already detailed, those of the male population include transport of every sort (1,094,501), building and other works of construction (1,642,864), manufacture of articles of human consumption, lodging, &c. (774,291), commerce, banking, &c. (530,685), domestic service, &c. (304,193), professional occupations (317,618). The service of government in every branch occupied 171,687. Female workers were occupied to the number of 1,664,381 in domestic service generally. Tailoring and the textile clothing industries and trade generally occupied 603,851; teaching 172,873; nursing and other work in institutions 104,056; and the civil service, clergymen and similar occupations 82,635.

**IX. TERRITORIAL DIVISIONS, &C.**

For various administrative and other purposes England and Wales have been divided, at different times from the Saxon period onwards, into a series of divisions, whose boundaries have been adjusted as each purpose demanded, without much attempt to establish uniformity. Therefore, although the methods of local government are detailed below (Section X.), and other administrative arrangements are described under various headings dealing with each subject, it is desirable to give here, for ease of reference and distinction, a schedule of the various areas into which England and Wales are divided. The areas here given, excepting the Poor Law Union, are those utilized in the Census Returns (see the General Report, 1901).

The ancient counties were superseded for most practical purposes by the administrative counties created by the Local Government Act of 1888. The ancient division, however, besides being maintained in general speech and usage, forms the basis on which the system of distribution of parliamentary representation now in force was constructed. The Redistribution of Seats Act 1885 made a new division of the country into county and borough constituencies. All the English counties, with the exception of Rutland, are divided into two or more constituencies, each returning one member, the number of English county parliamentary areas being 254. In Wales eight smaller or less populous counties form one parliamentary constituency, while the four larger are divided, the number of Welsh county parliamentary areas being 19. The number of county areas for parliamentary purposes in England and Wales is thus 253, and the total number of their representatives is the same. Outside the county constituencies are the parliamentary boroughs. Of these there are 155 in England, one of them, Monmouth district, being made up of three contributory boroughs, while many are divided into several constituencies, the number of borough parliamentary areas in England being 205, of which 61 are in the metropolis. Of the 205 borough constituencies, 184 return each one member, and 21 return each two members, so that the total number of English borough members is 226. Besides the county and borough members there are in England five university members, namely, two for Oxford, two for Cambridge and one for London. In Wales there are 10 borough parliamentary areas, all of which, except Merthyr Tydfil and Swansea town division, consist of groups of several contributory boroughs. Each Welsh borough constituency returns one member, except Merthyr Tydfil, which returns two, so that there are eleven Welsh borough members.

The administrative counties, created in 1888, number 62, each having a county council. They sometimes coincide in area with the ancient counties of the same name, but generally differ in a greater or less degree, for the following reasons—(1) in some cases an ancient county comprises (approximately) two or more administrative counties, in the formation of which names of some ancient divisions were preserved, thus:

<table>
<thead>
<tr>
<th>Administrative County</th>

<tr>
<td>Yorkshire</td>
<td>North Riding</td>
</tr>
</tbody>
</table>

The Scilly Islands, which form part of the ancient county of Cornwall, without being ranked as an administrative county, are provided with a county council and have separate administration. (2) The administrative counties are taken entirely from the counties of Middlesex, Kent and Surrey. (3) All boroughs which on June 1, 1888, had a population of not less than 50,000, boroughs which were already counties having a population of not less than 20,000, and a few others, were formed into separate administrative areas, with the name of county
ENGLAND

The system of local government now existing in England (see also the article Local Government) may be said to have been founded in 1888, when the Local Government Act of that year was passed. Since then the entire system of districts and parishes has been reorganized with due regard to the preceding legislation. The largest area of local government is the county; next to that the sanitary district, urban or rural, including under this head municipal boroughs, all of which are urban districts. The parish is, speaking generally, the smallest area, though, as will hereafter be seen, part of a parish may be a separate area for certain purposes; and there may be united districts or parishes for certain purposes. It will be convenient to follow this order in the present article. But before doing so, it should be pointed out that all local bodies in England are to some extent subject to the control of central authorities, such as the privy council, the home office, the Board of Agriculture, the Board of Trade, the Board of Education or the Local Government Board.

The Administrative County.—The administrative county includes all places within its area, with two important exceptions. The county boroughs and the county borough county.

The county is the second quarter sessions borough, which forms part of the county for certain specified purposes only. But the county includes all other places, such as liberties and franchises, which before 1888 were exempt from contribution to county rate. For each administrative county a county council is elected. For purposes of election the entire county is divided into divisions corresponding to the wards of a municipal borough, and one councillor is elected for each electoral division.

The electors are the county electors, i.e. in a borough the persons enrolled as burgesses, and in the rest of the county the persons who are registered as county electors, i.e. those persons who possess in a county the same qualification as burgesses must have in a borough, and are registered.

The qualification of a burgess or county elector is substantially the occupation of rated property within the borough or county, residence during a qualifying period of 12 months, the payment of rates for the qualifying property. A person so qualified is entitled to be enrolled as a burgess, or registered as a county elector (as the case may be), unless he is alien, has during the qualifying period resided outside of the United Kingdom, or is an undischarged bankrupt, or the holder of an office of profit under the crown, or is a member of parliament such as the Corrupt Practices Act, the Felony Act, &c. The lists of burgesses and county electors are prepared annually by the overseers of each parish in the borough or county, and are revised by the county court by bodies consisting of aldermen and county court judges in September or October of each year. When revised they are sent to the town clerk of the borough, or to the clerk of the peace of the county, as the case may be, by whom they are printed. The lists elected for a county are the same as those disqualifications as burgesses by law may be struck off, notwithstanding the inclusion of his name in a list of voters.

The qualification of a county councillor is similar to that required of a councillor in a municipal borough, with some modifications. A person may be qualified in any one of the following ways: viz. by being (1) enrolled as a county elector, and possessed of a property for the purpose of occupying him at not exceeding £30 a year; or (2) possessing any other property; or (3) possessed in the non-resident list, and possessed of the same property qualification (the non-resident list contains the names of persons who are qualified for enrolment in all respects save residence in the county or within 7 m. thereof, and are actually resident beyond the 7 m.) for the purpose of occupying him at not exceeding £30 a year. The office of county councillor for this qualification no property qualification is required, but the office of a councillor elected on this qualification only becomes vacant if for six months he ceases to reside within the county; (4) a person is qualified as a county elector, in the capacity of a registered voter in respect of the ownership of property in the county. Clerks in holy orders and ministers of religion are not disqualified as they are for being borough councillors, but in other respects the persons disqualifications to be elected for a borough. Such disqualifications include the holding of any office or place of profit under the council other than the office of chairman, and the being concerned or interested in any contract or
employment with, by or on behalf of the council. Women, other than married women, are eligible.

County councillors are elected for a term of three years, and at the end of that time they retire together. The ordinary day of election may fall on any day between the 1st and 15th March fixed by the council. Candidates are nominated in writing by a nomination paper signed by a proposer and seconder, and subscribed by eight or more assenting county electors of the division: and the engaging of expenses in and about the election of a poll has to be taken in the manner prescribed by the Ballot Act 1872. Corrupt and illegal practices at the election are forbidden by a statute passed in the year 1894, which imposes heavy penalties and disqualifications for the offences which it creates. These offences are to be described as those relating under influence, bribery, and personation, but certain others, of which the following are the chief.

Payment on account of the conveyance of electors to or from the poll; payment for any committee room in excess of a prescribed number; the engaging of expenses in and about the election beyond a certain maximum; employing, for the conveyance of electors to or from the poll, hackney cabs or carriages kept for hire; payments for bands, flags, cockades, &c.; employing for payment purposes any coachman, hackney carriage, or any other vehicle; publishing bills, placards or posters which do not disclose the name and address of the printer or publisher; using as committee rooms or for meetings any licensed premises, or any premises where food or drink is ordinarily sold for consumption on the premises or any club premises where intoxicating liquor is supplied to members. In the event of an illegal practice, payment, employment or hiring, committed or done inadvertently, relief may be given by the High Court, or the court of summary jurisdiction, on the application of the aggrieved elector or any other person involved.

Indeed, this is the only method when it is sought to set aside the election on any of the usual grounds, such as corrupt or illegal practices, or the disqualification of the candidate at the date of election. Election petitions against the election of councillors form a large part of the local cases (borough councillors, urban and rural district councillors, members of school boards and boards of guardians) are classed together as municipal election petitions, and are heard in the same way, by a commissioner who must be a barrister of not less than five years' standing. The election of a councillor from some place within the county, the expenses of the court being provided in the first instance by the Treasury, and repaid out of the county rates, except in so far as the court may order them to be paid by the county council, the candidate in whose name the nomination is created which has to be filled by a new election. A county councillor is required to accept office by making and subscribing a declaration in the prescribed form that he will duly and faithfully perform his duty as a councillor, and that he is not disqualified by any other law from being elected or for being a member for more than six months, his office becomes vacant by declaration of the council. In the case of disqualification by absence, the same fines are payable as upon non-acceptance of office, and the same liability arises on resignation. Acting without making the declaration, or without filing it in the council office, causes the discharge of the duties of the seat, after ceasing to be qualified, or after becoming disqualified, involves liability to a fine not exceeding £50, recoverable by action.

The councillors who have been elected come into office on the 1st March, and the election of the newly-elected council is held on the 16th or on such other day within ten days after the 8th as the county council may fix. The first business at that meeting is the election of a chairman, who is usually the senior member in order of precedence as mayor in a borough. He is elected for the ensuing year, and holds office until his successor has accepted office. The chairman must be a fit person, elected by the council from their own body or from persons not members of the council. The chairman is subject to the same qualifications as the members, and where the number is one-sixth. An alderman must be a councillor or a person qualified to be a councillor. If a councillor has vacated his office of councillor, and thus creates a casual vacancy in the council, in every third or one-half of the total number of aldermen go out of office, and their places are filled by election, which is conducted by means of voting papers. It will be observed, therefore, that while a county councillor holds office for three years, a county alderman holds office for six. The council may also appoint a vice-chairman who holds office during the term of office of the chairman; in London the council have power to appoint a paid deputy-chairman.

It may be convenient at this point to refer to the officers of the county council. Of these, the chief are the clerk, the treasurer, and the surveyor. Before 1888 the clerk of the peace was appointed by the consistory court. Officers. He held office for life during good conduct, and was thereupon to act by a sufficient deputy. Under the act of 1888 existing clerks of the peace became clerks of the councils of their counties, holding office by the same tenure as formerly, except in the county of London, which is governed by special acts. The clerk of the peace for the offices of clerk of the peace and clerk of the county council was to be made by the standing joint-committee, at whose pleasure he is to hold office. The same committee appoint the deputy-clerk, and fix the salaries of both officers. The clerk of the peace was formerly paid by fees which were fixed by quarter sessions, but he is now generally, if not in every case, paid by salary, the fees received by him being paid into the county fund. The county council may employ such other officers and servants as they may think necessary.

Subject to a few special provisions in the Local Government Act of 1888, the business of the county council is regulated by the provisions laid down in the Municipal Corporations Act 1882, with regard to borough councils. There are four quarterly meetings in every year, the dates of which may be fixed by the council, with the exception of that which must be held on the 15th of March, at which the accounts of the previous quarter after the 8th of March are as already noticed when treating of elections. Minutes are taken down in the council and submitted to the chairman, who signs them, and are then referred to the council for approval. All questions are determined by the votes of the majority of those present and voting, and in case of equality of votes the chairman has a casting vote. Minutes of the proceedings are taken, and if the chairman is not the chairman of the next meeting, the council are evidence of the proceedings. In all other respects the business of the council is regulated by standing orders which the council are authorized to make. Very full power is given to appoint joint-committees with other councils, and any matter may be delegated, with or without restrictions or conditions, any of their powers or duties except that of raising money by rate or loan. Power is also given to appoint joint-committees with other committees, or with local associations, for the benefit of the county. Those interested, but a joint-committee so appointed must not be confounded with the standing joint-committee of the county council and the quarter sessions, which is a distinct statutory body and is called the finance committee. The finance committee is also a body with distinct duties.

In order to appreciate some of the points relating to the finance of a county council, it is necessary to indicate the relations between an administrative county and the boroughs which are locally situated within it. The act of 1888 created a new division of boroughs into three classes: the first of these the first is the county borough. A certain number of boroughs which either had a population of not less than 50,000, or were counties of themselves, were made counties independent of the county council and free from the payment of county rate. In such boroughs the county council have, in addition to their powers under the Municipal Corporations Act 1881, all the powers of a county council under the Local Government Act. They are independent of the county council, and their only relation is that in some instances they pay a contribution to the county, e.g. for the cost of assizes where there is no separate assize for the borough. The boroughs thus constituted county boroughs enumerated in the schedule to the Local Government Act 1888 numbered sixty-one, but additional ones are created from time to time.

The larger quarter sessions boroughs, in those which had, according to the census of 1891, a population exceeding 10,000, form part of the county, and are subject to the control of the county council, but only for certain special purposes. The reason for this is that while in counties the powers and duties under various acts were entrusted to the county authority, in boroughs they were exercised by the borough councils. In the class of boroughs now under consideration these powers and duties are retained by the borough council; the county council exercise no jurisdiction within the borough in respect of them, and the borough is not rated in respect of them to the county
rate. The acts referred to include those relating to the diseases of animals, destructive insects, explosives, fish conservancy, gas meters, margarine, police, reformatory and industrial schools, riot (damages), sale of food and drugs, weights and measures. But for certain purposes these boroughs are part of the county and rateable to county rate, e.g. main roads, cost of assizes and sessions, and in certain cases pauper lunatics. The county councillors elected for one of these boroughs may not vote on any matter involving expenditure on account of which the borough is not assessed to county rate.

The third class of boroughs comprises those which have a separate court of quarter sessions, but had according to the census of 1881 a population of less than 10,000. All such boroughs form part of the county for the purposes of pauper lunatics, analysts, reformatory and industrial schools, fish conservancy, explosives, and, of course, the purposes for which the larger quarter sessions boroughs also form part of the county, such as main roads, and are assessed to county rate accordingly.

And in a borough, whether a quarter sessions borough or not, which had in 1881 a population of less than 10,000, all the powers which the borough council formerly possessed as to police, analysts, diseases of animals, gas meters, and weights and measures now and are transferred to the county council, the boroughs becoming in fact part of the area of the county for these purposes.

It will be seen, therefore, that for some purposes, called in the act general county purposes, the entire county, including all boroughs other than county boroughs, is assessed to the county rate; while for others, called special county purposes, certain boroughs are now assessed. This explanation is necessary in order to appreciate what has now to be said about county finance.

But before leaving the consideration of the area of the county it may be added that all liberties and franchises are now merged in the county and subject to the jurisdiction of the county council.

The county council is a body corporate with power to hold lands. Its revenues are derived from various sources which will presently be mentioned, but all receipts have to be carried to the county fund, either to the general county account if applicable to general county purposes, or to the special county account if applicable to special county purposes.

The county council may, with the consent of the Local Government Board, borrow money on the security of the county fund, all such receipts, for consolidating the debts of the county; purchasing land or buildings; any permanent work or other thing, the cost of which ought to be spread over a term of years; making advances in aid of the emigration or colonization of inhabitants of the county; and any purpose for which quarter sessions or the county council are authorized by any act to borrow. If, however, the total debt of the council will, with the amount proposed to be borrowed, exceed one-tenth of the annual rateable value of the property in the county, the money cannot be borrowed unless under a provisional order made by the Local Government Board and confirmed by parliament.

The period for which a loan is made is fixed by the county council with the consent of the Local Government Board, but may not exceed thirty years, and the mode of repayment may be by equal yearly or half-yearly instalments of principal or of principal and interest combined, or by means of a sinking fund invested and applied in accordance with the Local Government Acts. The loans authorized may be raised by debentures or annuity certificates under these acts, or by the issue of county stock, and in some cases by mortgage.

The county council has a finance committee for regulating and controlling the finance of the county, and the council cannot make any order for the payment of money out of the county fund save on the recommendation of that committee. Moreover, the order for payment of any sum must be made in pursuance of an order of the council signed by three members of the finance committee present at the meeting of the council, and countersigned by the clerk. The order is directed to the county treasurer, by whom authorized payments are then made.

The accounts of the receipts and expenditure of the county council are made up for the twelve months ending the 31st March in each year, and are audited by a district auditor. The form in which the accounts must be made up is prescribed by the Local Government Board. The auditor is a district auditor appointed by the Local Government Board under the District Auditors Act 1879, and in respect of the audit the council has to publish a statement of all receipts and expenditures, and to pay the auditor such remuneration as the council may determine. The auditor may, in investigating the accounts, require the production of any books, papers, or accounts or books as aforesaid, or of any other documents, and any other book or record, and may take such evidence as he may think fit. In all such cases, the auditor may summon any person to be examined, or to produce any evidence, and the evidence so taken and examined shall be admissible in any court of law or other On his own motion the auditor may allow any payment and surcharge the amount on the persons who made or authorized it. Against any assessment or order of the council, the auditor may apply to the High Court of Justice, and the question involved is one of law, or to the Local Government Board, who have jurisdiction to remit a surcharge if, in the circumstances, it appears to them to be fair and equitable to do so. It will be seen that this is really an effective audit.

The sources of revenue of the county are the exchequer contribution, income from property and fees, and rates. Before 1888 large grants of money had been made annually to local authorities in aid of the rates in counties. The rates may, under the Revenues of county council Act 1883, be reduced in order to raise a certain amount of money for purposes defined in the Act and other payments may be made to the county council out of county rates. All sums paid in aid of county rates or made available for county purposes are to be credited to the county fund, and the sums received and paid in respect of county purposes are to be charged to the county fund.

The council has the power to levy and enforce rates for all purposes which are subject to county rate. The scheme of rates and the purposes for which they are levied is fixed by the council, and is reviewed by the council each year. The council is also empowered to levy and enforce rates for such purposes as are subject to local rate.
Of the powers and duties of county councils, it may be convenient to treat of these first, in so far as they are transferred to or conferred on them by the Local Government Act 1888, under which they were created, and afterwards in so far as they have been conferred by subsequent legislation. Before the passing of the Local Government Act 1888, the only form of county government in England was that of the justices in quarter sessions (q.t.). Quarter sessions were originally a judicial body, but being the only body having jurisdiction over the county as a whole, certain powers were conferred and certain duties imposed upon them with reference to various matters of county government from time to time. The principal object of the act of 1888 was to transfer these powers and duties from the quarter sessions to the new representative body—the county council; and it may be said that substantially the whole of the administrative business of quarter sessions was thus transferred.

The subjects of such transfer include (i), the making, assessing and levying of county, police, hundred and all rates, and the application of payment of sums payable out of any such rate, or out of the county stock or county fund, and the preparation and revision of the basis or standard for the county rate. With regard to the county rate, a number of justices are bound to meet and appoint a committee, called the county rate committee, who, from time to time, prepare a basis or standard for county rate, that is, they fix the amount at which each parish in the county shall contribute to the county rate. As a general rule the poor-law valuations are followed, but this is not the case in counties where some county councils adopting the assessment to income tax, schedule A, and others forming an independent valuation of their own. Many rates passed approved by the basis may appeal against it to quarter sessions, and it is to be noted that this appeal is not interfered with, the transfer of the duties relating only to administrative and not to judicial business.

When a county rate is required from county rate, the county council assess the amount necessary, make their basis previously made, and send their precept to the guardians of the unions comprising the several parishes in the county, the guardians in their turn requiring the overseers of each parish to prepare a return, on the basis of which the rate is levied, and the sum thus raised goes into the county fund. The police rate is made for the purpose of defraying the expenses of the county police. It is made on the same basis as the county rate, and is levied in the same way. The hundred rate is seldom made, though in some counties it may be made for purposes of main roads and bridges chargeable to the hundred as distinguished from the county at large; (ii), the borrowing of money; (iii) the passing of the accounts of any money so borrowed and expended; (iv) the making and executing of contracts and the opening of posts and stations; (v) the licensing of the sale of intoxicating liquors under the Racecourses Licensing Act 1879; (vi) the provision, enlargement, maintenance and management and visitation of, and other dealing with, asylums for pauper lunatics; (vii) the establishment and maintenance of, and the control, repair, and sale of, local authority of the acts relating to contagious diseases of animals, to destructive insects, to fish conservancy, to wild birds, to weights and measures, and to gas meters, and of the Local Stamp Act 1869; (xiv) any matters arising under the Riot (Damages) Act 1886. Upon any person to which the act of 1888 relates, and of the powers and duties of the county council for the time being. It is necessary to have an additional list of the powers and duties of the county council; and it may be said that substantially the whole of the administrative business of quarter sessions was thus transferred.

Apart from the business thus transferred to county councils, the act itself has conferred further powers or imposed further duties, reference to a variety of other matters, some of which have been already referred to; but although such an order was made at the time prepared, it has never been confirmed, and nothing has been done in that direction, which is a very ancient one, see that title. The county council may appoint any fit person, not being a county alderman or county councillor, to fill the office, and any county alderman or county councillor may, if he is a member of a county council, shall appoint in counties on matters of a private nature or the public interest, the county surveyor of the county, the county surveyor, the public analysts, any officers under the county surveyor, and any officers whose remuneration is paid out of the county rate, other than the clerk of the peace and the clerks of the justices; (xli) the division of the county into coronors’ districts and the assignments of days for the holding of sessions in such districts for the purposes of parliamentary elections, and of his duty, the division of the county of coronors’ districts and the assignments of days for the holding of sessions in such districts for the purposes of parliamentary elections, and of his duty, the division of the county into coronors’ districts and the assignments of days for the holding of sessions in such districts for the purposes of parliamentary elections, and of the powers and duties of the county council under the Local Government Act 1888, and that body alone has now power to declare a road to be a main road. But the act of 1888 made some important
changes in the law relating to the maintenance of main roads. It declared that thereafter not only the half but the whole cost of maintenance should be borne by the county. Provision is made for the control of main roads in urban districts being retained by the county, and specific provisions being made to that effect. Special powers have also been made for the highways in the Isle of Wight and in South Wales, where the roads were formerly regulated by special acts, and not by the ordinary Highway Acts. In the same county a sanitary authority to enforce the provisions of the Rivers Pollution Prevention Acts in relation to so much of any stream as passes through or by any part of their county. Under these acts a sanitary authority is required to take proceedings to restrain interference with the due flow of a stream or the pollution of its waters by throwing into it the solid refuse of any manufactories or quarries, or any rubbish, or cinders, or any other waste or industrial solid matter. They may also take proceedings in respect of the pollution of a stream by any solid or liquid sewage matter.

They have the same powers with respect to manufacturing and mining pollution, subject to certain restrictions, one of which is that the council must either be taken under the correspondent act or be taken under the Local Government Board. The county council may not only themselves institute proceedings under the acts, but they may contribute to the costs of any prosecution under the acts instituted by any other county council. The Local Government Board is empowered by provisional order to constitute a joint-committee representing all the administrative counties through or by which a river passes, and confer on such committee all or any of the powers of a sanitary authority under the acts.

A county council has the same powers of opposing bills in parliament and of prosecuting or defending any legal proceedings necessary for the promotion or protection of the interests of the inhabitants of a county as are conferred on the councils of the counties of the United Kingdom under the township rate of 1872, with this difference, that in order to enable them to oppose a bill in parliament at the cost of the county rate, it is not necessary to obtain the consent of the owners and ratepayers within the county. The council are not authorized to promote any bill, and although they frequently do so, they incur the risk that if the bill should not pass the members of the council will be charged personally with the costs incurred in the attempt to have their wishes carried. Of course if the bill passes, it usually contains a clause enabling the council to recover the costs of promotion to be paid out of the county rate. It must be supposed, however, that the county council have no power to introduce such a clause into the proceedings, nor have they expressly conferred upon them by the Local Government Act. In this respect they are in the same position as all other local authorities, with respect to whom it has been laid down that they may not and are not entitled to act for the purpose of protecting themselves against any attack made upon their existence as a corporate body or upon any of their powers or privileges.

The county council have also the same powers as a borough council of making by-laws for the good government of the county and for the suppression of nuisances not already punishable under the general law. This power has been largely exerted throughout England, and the courts have on several occasions decided that such by-laws should be interpreted, and that in matters which directly arise and concern the people of the county, who have the right to choose those whom they think best fitted to represent them, such representatives may be regarded as agents of the local government. It will therefore be upheld, unless it is clear that they are uncertain, repugnant to the general law of the land, or manifestly unreasonable. It may be mentioned that, while by-laws relating to the good government of the county are not to be considered as those which relate to the suppression of nuisances have to be confirmed by the Local Government Board. Such confirmation, however, though necessary to enable the council to enforce them, does not affect their validity.

The county council have power to appoint and pay one or more medical officers of health, who are not to hold any other appointment or engage in private practice without the express written consent of the council. The duties of the medical officer is to be deemed to have been satisfied. Every medical officer, whether of a county or district, must now be legally qualified for the practice of medicine, surgery and midwifery. Besides this, in the case of a county, or of any district or combination of districts of which the population exceeds 50,000, the medical officer must also have a diploma in public health, unless he has during the three consecutive years before 1892 been medical officer of a district or combination having a population of more than 20,000, or has before the expiration of such period been medical officer of the Local Government Board.

The only other powers and duties of a county council arising under the Local Government Act itself which it is necessary to notice are the police powers, and the county council is charged with the powers of the Local Government Board.

It may be convenient here to state that certain alterations of areas can only be effected through the medium of the Local Government Board after local inquiry. These powers include the alteration of the boundary of an urban county or borough, the union of a county borough with a county, the union of any counties or boroughs or the division of any county, the making of a borough into a county borough. In these cases the ordinance is made by the local government; its terms must be confirmed by parliament. The powers of a county council to make orders for the alteration of local areas are as follows: When a county council is satisfied that a prima facie case is made out as respects any county district or borough, or as respects any parish, for a proposal for all or any of the things hereafter mentioned, they may hold a local inquiry after giving such notice in the locality and to such public departments as may be prescribed from time to time by the Local Government Board, or any other local authorities. In order to determine whether the order should be confirmed or not, if the council of any district affected by it, or one-sixth of the total number of electors in the district or parish to which it relates, petition against it, the Local Government Board has to make an inquiry, or if the proposed order is for the alteration of the boundary of the district or parish; the division or union thereof with any other district or districts, parish or parishes: the conversion of a rural district or part thereof into an urban district: the alteration of the boundaries of any urban local inquiry referred to has been held, the county council, being satisfied that the proposal is desirable, may make an order for the same accordingly. The order has to be submitted to the Local Government Board, who must make a confirmatory order in order to determine whether the order should be confirmed or not, if the council of any district affected by it, or one-sixth of the total number of electors in the district or parish to which it relates, petition against it. The Local Government Board may then make an order in terms of the order whether it is petitioned against or not, but if there is no petition, they are bound to confirm, subject only to such modifications. Very large powers are conferred upon county councils for the purpose of giving full effect to orders made by them under the Local Government Act. For instance, a new local authority was made by the Local Government Act 1894, which practically required every council to take into consideration the areas of sanitary districts and parishes within the entire administrative county, and to provide for the division of any such districts or parishes into one or more sanitary districts, or for the alteration of the same, or for the combination of any such districts, or for the alteration of the boundary of any such districts, and to provide for the division of a district which did extend into more than one district into separate parishes, so that for the future the parish should not be in more than one county district; and to provide for the division of the rural sanitary districts within one county. An enormous number of orders under the act of 1894 was made by county councils, and, speaking generally, it will now be found that no parish extends into more than one county or county borough, practically the whole of the area of one or more of the county councils under the act of 1894 will be noticed hereafter.

Of the statutes affecting county councils passed subsequent to 1888 mention need only be made of the chief. Previous to the Education Act 1902, county councils had certain optional powers under the Technical Instruction Acts to supply or aid the supply of technical or manual instruction. Their duties in respect of educational and medical matters are mainly enlarged by the act of 1902. That act abolished the old school boards and school attendance committees, and substituted a single authority for all kinds of schools and for all kinds of education. The county council is the council of a county borough, or the council of a county, which is for the purposes of the local education authority, except that non-county boroughs with a population of over 10,000, and urban districts with a population of over 20,000, may be the local education authorities for elementary education in the urban districts of the county. For higher education the county councils and county boroughs are the sole education authorities, except that non-county boroughs and urban councils are given a concurrent power of levying a special education rate. In each county education committee, an education committee must be established by all authorities. The majority of the members of the committee are appointed by the council, usually out of their own body, and the remainder are appointed by the council, in such cases, on the nomination of others. Some of the members of the committee must be women. All matters relating to the exercise of the powers of the education authority (except those of rating and borrowing) must be referred to the council of the county borough, or the council of the county. In case of emergency, the council must receive and consider the report of the education committee with respect to the matter in question. As to higher education the local education authority must consider the educational needs of their area and take such action as seem to them desirable, after consultation with the Board of Education, to supply or aid the supply of education other than elementary, and to promote the general co-ordination of all forms of education. For this purpose they are authorized to levy a rate not exceeding 2d.
in the £, except with the consent of the Local Government Board. They must also devote to the same purpose the sums received by them in respect of the residue of the English share of the local taxation (customs and excise) duties already referred to. See further England, below. 

Under the Midwives Act 1892, every council of a county or county borough is the local supervising authority over midwives within its area. The duty of the local supervising authority is to appoint a local council of midwives to be the council which, under the provisions of the act, may provide and to keep a register of the names of midwives licensed to practice within their area in accordance with rules laid down in the act; to investigate charges of malpractices, negligence or misconduct on the part of a midwife, and if a prima facie case be established, to report to the central board the name of any midwife convicted of an offence; once a year (in January) to supply the central board with a statement of the names of licensed midwives exercising their practice in any part of their area and to keep a roll of the names, accessible at all reasonable times for public inspection; to report at once the death of any midwife or change in name and address. The local supervising authority may delegate their powers to a committee appointed by them, women being eligible to serve on it. A county council may delegate its powers under the act to a district council.

Part of the business transferred from quarter sessions to the council was that which related to pauper lunatics, but the whole subject was transferred by an act of 1890, which again has been amended by a later act. The councils of all administrative counties and county boroughs and the councils of a few specified quarter sessions boroughs, which before 1890 were responsible in dependent areas for the purposes of the Lunacy Acts, are local authorities for the purposes of the Lunacy Acts, and each of them is under an obligation to provide asylum accommodation for pauper lunatics. This accommodation may be provided by one council or by a combination of councils. It must be maintained and provided for at its own expense. In the case of a combination the expenses are defrayed by the several councils in such proportion as they may agree upon, and the proportion may be fixed with reference to either the accommodation required by each parish or the number of pauper lunatics in each parish. If a council submit such a scheme to the central board, the council may, instead of providing an asylum of its own, contract with the visiting committee of any asylum to receive the pauper lunatics from the borough. Private patients may be accommodated in hospitals or asylums under the control of county or borough councils.

Under the Allotments Acts 1887 to 1901, it is the duty of a county council to make suitable arrangements for the supply of allotments in the urban districts and parishes in the county, or would be a demand if suitable land were available, and the extent to which it is reasonably practicable, having regard to the cost of any schemes, to arrange that the council, or co-operate with others, associations or persons, qualified to assist, and to take such steps as may be necessary. The powers of the Local Government Board under the Allotments Acts were transferred by the act of 1901 to the Board of Agriculture. These and the Fishery Acts are administered by the Local Government Board, and the general district councils were transferred to parish councils. The county council under these acts has compulsory powers of purchase or hire if they are unable to acquire land by agreement and on reasonable terms. If an order in pursuance of the powers of purchase or hire is made, the order will not be confirmed by the Board of Agriculture until after a local inquiry has been held. If the Board of Agriculture is satisfied, after holding a local inquiry, that a county council has failed to arrange for the supply of allotments in the county, they may transfer all any of the powers of the county council to the Small Holdings Commissioners. By the Small Holdings and Allotments Act 1907, Small Holdings Commissioners are to be appointed by the Board of Agriculture to ascertain the extent of the demand for small holdings, and confer with county councils as to how best to provide them. Local authorities are required to furnish information and give assistance to the Commissioners. The Commissioners are to be appointed by the Board of Agriculture, and the order will not be confirmed by the Board of Agriculture until after a local inquiry has been held. If the Board of Agriculture is satisfied, after holding a local inquiry, that a county council has failed to arrange for the supply of small holdings, it may transfer all any of the powers of the county council to the Small Holdings Commissioners. Small holdings.

Miscellaneous.

The municipal borough and the borough council.

In the year 1835 the Municipal Corporations Act was passed, which made provision for the constitution and government of certain boroughs which were enumerated in a schedule. That act was from time to time amended, until in 1882 by an act of that year the whole of the earlier acts were repealed and consolidated. A few ancient corporations which were not enumerated in the schedule to the act of 1835 continued to exist after that year, but by an act of 1883 all of these, save such as should obtain charters before 1886, were abolished, the result being that all boroughs are now subject to the act of 1882. A place is still created by a royal charter on the petition of the inhabitants, and when that is done the provisions of the act of 1882 are applied to it by the charter itself. The charter also fixes the number of councillors, the
boundaries of the wards (if any), and assigns the numbers of councilors to each ward, and provides generally for the time and manner in which the body of 1882 shall be elected to come into operation. This charter is supplemented by a scheme which makes provision for the transfer to the new borough council of the powers and duties of existing authorities, and generally for the bringing into operation of the act of 1882. If the scheme is opposed by the prescribed proportion (one-twentieth) of the owners and ratepayers of the proposed new borough, it has to be confirmed by parliament. The governing body in a borough is the council elected by the burgesses.

The qualification of a burgess has been incidentally mentioned in connection with that of a county elector, and need not be further noticed. A borough council must be qualified as the electors may determine, but as a general rule it is to be elected in the same way, with this addition, that a peer or ownership voter is not qualified as such, and that a person is disqualified for being a borough councilor if he is in holy orders or is the regular minister of a congregation and officers other than mayor and aldermen; except that borough councilors are elected for a term of three years, one-third of the whole number going out of office in each year, and if the borough is divided into wards, these are so arranged that the number of councilors in each shall not exceed three. Election must be by ballot, and in the ordinary day of election is the 1st of November. At an election for the whole borough the returning officer is the mayor; at a ward election he is an alderman assigned for that purpose by the council.

The law as to corrupt and illegal practices at the election is also similar, and the election may be quashed and a new one ordered, if the returning officer directs, or the councilor dissatisfied, if the councilor may be disqualified in the same way as a county councilor, by bankruptcy or composition with creditors, or continuous absence from the borough (except in case of illness). In short it may be said that the borough council is subject to the same regulations as the county council, and that the local government act of 1888 has been extended to the borough by-laws. The election of councilors is by the county electors, and the 1st of November the first quarterly meeting of the council is held on the 9th, and at that meeting the mayor and aldermen are elected. The election of the mayor and aldermen is again the same as has already been described in connexion with the election of the chair-

man and aldermen of a county council. The officers of a

bou borough council are the town clerk and the treasurer, but the council have power to appoint other officers as they think necessary. In the officers of the council, from time to time fit, and hold office during pleasure. The provisions with respect to the transactions of the business of the council are also the same in the case of a borough as in that of a county council.

Finance audit.

Finance of the borough council is paid out of the fund, and that fund is charged with certain payments, which are specifically set out in the 5th schedule to the act of 1882. These include the remuneration of the mayor, recorder, clerk, keepers of gaol, and aldermen, and the offices of assessor, surveyor, and collector of land tax. The expenses of the administration of justice in the borough, the payment of the county coroner, police expenses, and the like. An order of the council for the payment of money out of the borough fund must be signed by three members of the council, and countersigned by the clerk, and any such order may be removed into the king's bench division of the High Court of Justice by writ of certiorari, and may be wholly or partly disallowed or confirmed on the hearing. This is resignable. If the court so orders, the council can be questioned, for, as will be seen hereafter, the audit in the borough is not an effective one. The borough fund is derived, in the first instance, from the property of the corporation. If the income from this source is insufficient to meet the demands upon it, the fund being more than sufficient to meet the demands upon it without recourse to a borough rate, any surplus may be applied in payment of any expenses of the council as a sanitary authority or in improving the roads and bridges, or otherwise. The borough treasurer is required to make up his accounts half-yearly, and to submit them, with the necessary vouchers and papers, to the borough auditors. These auditors are three in number—two of them elected annually by the burgesses. An elective auditor must be qualified to be a councillor, but may not be a member of the council. The third auditor is appointed by the mayor and is called the mayor's auditor. The auditors so appointed are charged with the duty of auditing the accounts of the treasurer, but they have no power of disallowance or surcharge, and their audit is therefore quite ineffective.

Where a borough has not a separate court of quarter sessions, but has a quarter sessions of the peace, the judicial functions of the county in which the borough is situated have a concurrent jurisdic-

tion with the borough justices in all matters arising within the borough. Where, however, the borough has a separate quarter sessions, the jurisdiction of the council is extended to quarter sessions for the borough, and a justice of the peace for the borough is appointed ex officio. A borough justice is required to take the oaths of allegiance and the judicial oaths before acting; he must while acting reside in or within 7 m. of the borough, or occupy a house, warehouse or other property in the borough; but he need not be a borough or to have any claim to the rent of a house. The borough has a separate commission for quarter sessions, or a separate commission or not, the mayor, by virtue of his office, is a justice for the borough, and the mayor is ex officio the chair of the council. The borough has a separate commission for quarter sessions or a separate commission or not, the mayor, by virtue of his office, is a justice for the borough, and the mayor is ex officio the chair of the council. A borough justice is required to take the oaths of allegiance and the judicial oaths before acting; he must while acting reside in or within 7 m. of the borough, or occupy a house, warehouse or other property in the borough; but he need not be a borough nor to have any claim to the rent of a house.

The act of 1882 is the maintenance of bridges within the borough which are not repairable by the county in which the borough is situated. The county council, when the whole, or any part of the borough is a town, or is a county of itself, has the power to repair all public bridges within its limits. In a borough which is not a county of itself the inhabitants are only liable to repair bridges within their own limits. Of the other powers possessed by the council of a borough under the act of 1882, one of the most important is the power to make by-laws for the good rule and government of the borough. Under this power the council of a borough may already be punished in summary manner by virtue of an act in force throughout the borough. It will be observed that these by-laws are of two classes. The former do not come into force until the expiration of the period of more than four years from the passing of the act of state, during which forty days the sovereign in council may disallow any by-law or part thereof. The latter require to be confirmed by the Local Government Board.

Under the act of 1882 every municipal borough might have its own separate police force. As has already been stated when dealing with county councils, boroughs having a population of less than 10,000 according to the census of 1861 can no longer have a

jurisdiction of justices: quarter sessions.

sheriff coroner.

to acquire land.

Borough bridges.

by-laws.
separate police force. But for some time before that year it had become the rule not to grant to any new borough with a population of less than 20,000 a separate police force. The subject of police is separately treated in the Encyclopaedia Britannica, and the following is extracted from the part of that article dealing with the police of rural districts.

Under an act of 1893 the borough police may, in addition to their ordinary duties, be employed to discharge the duties of a firebrigade.

The powers and duties of a borough council in the Municipal Corporations Act do not arise or exist to any great extent under that act. In a few cases, those namely of county boroughs, the councils have the powers of county councils. In the quarter sessions boroughs other than county boroughs they have some only of these powers. But in every case the council of the borough have the powers and duties of an urban district council, and, except where they derive their authority from local acts, it may be said that their powers and duties of an urban district council will arise or exist to some extent, whether under the provisions of which have been referred to when dealing with county councils, or perform as an urban council. These will now be considered.

Before the year 1848 there was not outside the municipal boroughs any system of district government in England. It is true that in some populous places which were not incorporated boroughs local acts of parliament had been passed appointing improvement commissioners for the government of these places. In many boroughs similar acts had been obtained conferring various powers relating to sanitary matters, streets and highways and the like. But there was no general system, nor was there, save by special legislation, any means by which sanitary districts could be constituted. In the year 1848 the first Public Health Act was passed. It provided for the formation of local boards in boroughs and populous places, such places outside boroughs being termed local government districts. In the boroughs the town council were generally appointed the local board for purposes of the act. It was not, however, until 1872 that a general system of sanitary districts was adopted. By the Public Health Act of that year the whole country was mapped out into urban and rural sanitary districts, and that system has been maintained until the present time, with some important changes introduced by the Public Health Acts 1875 to 1907, and the Local Government Act 1894.

The sanitary districts of England and Wales are either urban or rural. Urban districts include boroughs and places which were formerly under the jurisdiction of local boards or improvement commissioners. The power to constitute new urban districts may now be conferred on county councils, as already stated. There is a concurrent power in the Local Government Board under the Public Health Act 1875, but that power is now rarely exercised, and new urban districts are in practice created only by orders of county councils made under the Local Government Act 1888, section 57. Rural sanitary districts were first created in 1872. Before that time there was practically no sanitary authority outside the urban districts, for although the vestry of a parish had in some cases power to make severe rates and some other sanitary powers, there was no authority for such a district as now corresponds to a rural district.

There were, indeed, highway boards and burial boards which had powers for special purposes, but district authority in the sense in which it is now understood in England and Wales is divided into districts in the manner already stated. The sanitary district consisted of the area of the poor-law union, exclusive of any urban district which might be within it, and the guardians of the poor were the rural sanitary authority. Since 1894 this has been changed. By the Local Government Act 1894 it was enacted that the rural district consisted of the area of the rural sanitary district, which was a function of the rural sanitary authority. The union was preserved as the rural sanitary district, with this qualification, that if it extended into more than one county it was divided so that no rural district should extend into more than one county. The whole county is divided into rural sanitary districts, and the rural sanitary districts are, in their turn, divided into rural districts. After the union having ceased to be the same body as the guardians and are now wholly distinct. A district councillor, whether urban or rural, holds office for a term of three years. One-third of the whole council retire in each year, the annual elections are therefore spread out over three years. The term of office of the whole council is in every third year if the county council at the instance of the district council so order. The qualification and disqualification of district councillors, whether urban or rural, now depend upon the Local Government Act 1894. Property qualification is abolished. Any person may be elected who is either a parochial elector of some parish within the district or has during the whole of the twelve months preceding his election resided in the district, and no person is disqualified by sex or marriage. The elections both in urban and rural districts are the body called the parochial electors. These are practically the persons whose names appear in the parliamentary register or in the local government register as being entitled to vote at the annual election for the members of the district council as the case may be. The election takes place subject to rules made by the Local Government Board, these rules being largely founded upon adaptations of the Municipal Corporations Act 1882. The election is by ballot on the same lines as those prescribed for the election of members of the local government boards. The provisions of which have been referred to when dealing with county councils, applies to the elections of district councils. The provisions with reference to election petitions, the grounds upon which they may succeed, and the decision of the petition, are the same in every respect as have already been mentioned when dealing with county councils. It may be convenient here to state that the Local Government Board has power to unite any number of rural sanitary districts for the purpose of forming a rural district for certain special purposes such as water-supply, sewerage or the like. This is done by means of a provisional order made by the board and confirmed by parliament. In such a united rural sanitary district as the case may be a joint council is constituted in manner provided by the order, and it has under the order such of the powers of a district council as are necessary for the purposes for which the united district is created. Thus a joint sewerage board would generally be invested by the order with all the powers of a district council as regards the laying and the disposal of sewage. It may also be convenient here to mention another special kind of district authority, that is, a port sanitary authority. It is also constituted by order of the Local Government Board, and may be formed in harbours which are to be supplied with water, or more sanitary districts or parts of districts abutting upon a port. In this case also the authority consists of such members and is elected in such manner as the order determines, and it has all the powers of a district council as are necessary for the purpose for which it may confer upon it. These relate for the most part to nuisances and infectious disease, having special reference to ships. It has been thought convenient to deal here with district councils, whether urban or rural, together, but the powers of the former are described at length in a separate chapter, as the consideration of the subject proceeds it will be necessary to indicate what powers and duties are conferred or imposed upon urban district councils only.

In the separate urban and rural sanitary districts, or the joint districts otherwise rural there are some centres of population, hardly large enough to be constituted urban districts, which nevertheless require the same control as an urban district.

The council of an urban or rural sanitary district now have to make regulations with respect to summoning, notice, place, management and adjournment of their meetings, and generally with respect to the transaction and management of their business. Three members must be present to constitute a quorum. At the monthly meeting of the council, which is held on the 15th day of each month, a chairman for the succeeding year has to be appointed. He presides at all meetings, and in his absence another member appointed by the meeting takes his place. Questions are determined by the majority present at a meeting, the chairman having the casting vote. Minutes are taken and, if signed at the meeting or the next ensuing meeting, are made evidence. The officers of the council consist of a clerk, a medical officer, a surveyor, and such county officers as may be required. All urban and rural district councils are under Act 1875, as amended by Act 1897, and the medical officer of health and inspectors of nuisances hold office at pleasure and receive such remuneration as the council may determine. If the urban district is a borough, the town clerk and the registrar of births and deaths are also officers of the Public Health Acts. The salaries of the medical officer of health and inspectors of nuisances are, as to one moiety thereof, paid out of "the exchequer contribution account," by the county council, if they are appointed in accordance with the requirements of the Local Government Act 1888. There is no tenure of office. The orders of the Local Government Board as to these matters are set out in the Statutory Rules and Orders. District councils may also employ such other officers and servants as may be required. District councils are not subject to the severe penalty of being rendered incapable of holding office under any district council, and of a pecuniary penalty of £50. There are some exceptions to this provision somewhat similar to those already mentioned. It may be mentioned here that by an act, called the Public Bodies' Corrupt Practices Act 1889, severe penalties are imposed alike upon members and officers of public bodies for corruption in office.

LOCAL GOVERNMENT

ENGLAND

435
A district council may appoint committees consisting wholly or partly of members of their own body for the exercise of any powers which in their opinion can properly be exercised by such committees. Such committees do not, however, act without the concurrence of the council, and their acts must be submitted to the council for their approval. If they are appointed for any purposes of the Public Health or Highways Acts, the council may authorize them to institute any proceedings or do any act which the council might have instituted or done. Where any power or duty vested in or imposed on a rural district council is to be exercised or performed by the council, the council, may, if the council think fit, delegate the whole or any part of such power or duty to any of its committees, and the council may appoint any of its members as their agent for the purpose of exercising such power or performing such duty. The council may be subject to any regulations and restrictions imposed upon it by the district council.

In dealing with the powers and duties of district councils it will be convenient to refer to the enactments of the Public Health Acts, and afterwards as they arise under other statutes. In so far as such powers and duties are common to urban and rural district councils alike they will be considered as appertaining to district councils. Where reference is made to any power or duty of an urban council it is to be understood that the rural council have no such power or duty unless conferred or imposed upon them by order of the Local Government Board. And it must be borne in mind, whenever the Local Government Board is spoken of in the Urban Sanitary Act 1883, that in that a borough the Local Government Board is understood to be that for the district.

The district council are required to cause to be made such sewers as may be necessary for effectually draining their district. This duty may be enforced by the Local Government Board on complaint, in writing, of their councils, or on complaint of the council or by any person interested in the drainage of the district. The Local Government Board may by the same order require the council to construct any works, or to carry out any work in the district for the purpose of carrying out the plans or arrangements for the drainage of the district in any part of the district. The Local Government Board may also by order direct the council to remove any buildings, or to cause them to be removed, or to obstruct any opening, or to bring any water or to make such works necessary for the purpose of carrying out the plans or arrangements for the drainage of the district. The Local Government Board may also by order make such works necessary for the purpose of carrying out the plans or arrangements for the drainage of the district.

Sewage and drainage. 

The district council are required to cause to be made such sewers as may be necessary for effectually draining their district. This duty may be enforced by the Local Government Board on complaint, in writing, of their councils, or on complaint of the council or by any person interested in the drainage of the district. The Local Government Board may by the same order require the council to construct any works, or to carry out any work in the district for the purpose of carrying out the plans or arrangements for the drainage of the district in any part of the district. The Local Government Board may also by order direct the council to remove any buildings, or to cause them to be removed, or to obstruct any opening, or to bring any water or to make such works necessary for the purpose of carrying out the plans or arrangements for the drainage of the district. The Local Government Board may also by order make such works necessary for the purpose of carrying out the plans or arrangements for the drainage of the district.

Sanitary accommodation for houses.

The Local Government Board may, by order, require the council to provide and maintain such sanitary arrangements for the occupation of the district. The council may also by order direct the council to provide and maintain such sanitary arrangements for the occupation of the district. The council may also by order direct the council to provide and maintain such sanitary arrangements for the occupation of the district.

Removal of refuse.

The district council are charged with the duty of enforcing the provision of proper sanitary accommodation (water-closets, privies, ashpits, &c.) for all dwelling-houses, new or old, and for factories, and the maintenance of such conveniences as are provided. The council may also by order require the council to provide and maintain such sanitary arrangements for the occupation of the district. The council may also by order direct the council to provide and maintain such sanitary arrangements for the occupation of the district. The council may also by order direct the council to provide and maintain such sanitary arrangements for the occupation of the district.

Water-supply.

The Local Government Board may, by order, require the council to provide and maintain such sanitary arrangements for the occupation of the district. The council may also by order direct the council to provide and maintain such sanitary arrangements for the occupation of the district. The council may also by order direct the council to provide and maintain such sanitary arrangements for the occupation of the district.

The Local Government Board may, by order, require the council to provide and maintain such sanitary arrangements for the occupation of the district. The council may also by order direct the council to provide and maintain such sanitary arrangements for the occupation of the district. The council may also by order direct the council to provide and maintain such sanitary arrangements for the occupation of the district.

Power is given to prohibit the use as dwellings of any cellars, vaults or underground rooms built or occupied after 1875, and with regard to such cellars as were occupied as dwellings before 1875.
the continued occupation of these is also forbidden unless they comply with certain stringent requirements as to the height of the rooms, the height of the ceilings above the surface of the street, open areas in front, effective drainage, sanitary conveniences appurtenant to the cells, and the provision of fireplaces.

District councils are required to keep a register of the common lodging-houses in their district. No person is allowed to keep a common lodging-house unless he is registered in the council’s register. A house may not be registered until it has been inspected and approved for the purpose by an officer of the council. Further, the council may refuse to register a keeper of a common lodging-house if they are of the opinion that the house is not suitable for the purpose. The council is empowered to make by-laws for the regulation of the number of lodgers and separating the sexes therein, promoting cleanliness and ventilation, giving notices and taking precautions in case of any infectious disease, and generally for the well-ordering of common lodging-houses. Any person shall be required by the council to clean and put into a state of good repair the walls and ceilings of the house in April and October in every year, and if paupers or vagrants are received to lodge, they may be required to report to the council as to the persons who have resided in the house within a month of its last inspection. The keeper of a common lodging-house is required to provide the medical officer of health and the poor-law relieving officer with free access to the house, and they must give free access for inspection. There is no definition of the expression “common lodging-house” in the Public Health Acts, but by authority of a decision of the House of Lords, a house occupied and kept for the purpose of common lodging by persons of different descriptions and races, is not a common lodging-house. The idea is now explodcd, and the acts apply to charitable institutions which receive persons of the class ordinarily received into common lodging-houses.

By-laws may also be made relating to houses let in lodging-houses. These by-laws are in practice limited to those inhabited by the lower classes, although the act imposes no such restriction.

The Public Health Acts 1875 to 1907 contain elaborate provisions for dealing with nuisances. Those which are dealt with summarily are declared to be nuisances if committed by the owner, occupier, or any person on whose land it stands, while work is carried on as to be a nuisance or injurious to health; (2) any pool, ditch, gutter, watercourse, privy, urinal, cesspool, drain or ash pit foul or in such a state as to be injurious to health; (3) any animal so kept as to be a nuisance; (4) a putrefying or stinking substance which is deposited or kept, or is deposited or kept by which a nuisance is caused; (5) any house or part of a house so overcrowded as to be dangerous or injurious to the health of the occupants, whether or not members of the same family; (6) any factory, workshop, or warehouse in which infectious or putrid matter is generated, and if a nuisance; (7) any chimney which contains the smoke of a factory, dye-house, brewery, bakehouse or gas works, or in any manufacturing or trade process whatsoever; and (8) any chimney not being the chimney of a private dwelling-house so situated and constructed that the smoke from it is not injurious to health. The nuisance above enumerated are said to be nuisances liable to be dealt with summarily. It is the duty of the district council to inspect their district with a view to the discovery of any such nuisances within the council’s limits, and to cause the nuisance to be removed by the owner or occupier of the premises. The notice, however, must be served on the owner or occupier of the premises, the local authority may themselves abate the nuisance without further order. If the person on whom the notice is served does not give effect to it, he may be summoned before justices, and the justices may make an order for the abatement of the nuisance, or direct the owner or occupier to remove it. The order of the nuisance if this is likely, and directing the execution of the necessary works. If the nuisance is such as to render a dwelling-house unfit for human habitation, the justices may close it until it is repaired. The cost of abating or removing the nuisance involves a penalty and a daily penalty for each day during which default continues. Private persons may complain to justices in respect of nuisances by which they are personally aggrieved, and if the district council make default of their duty, the local authority or the Government Board may authorize any officer of police to institute any necessary proceedings at the cost of the defaulting council. The district council may, if in their opinion proceedings before justices afford an inadequate remedy, take proceedings in the high court, but in that case, if the nuisance is of a public nature, they must proceed by action in the name of the attorney-general. The provision relating to nuisances is contained in the Public Health Acts 1875 to 1907.

It is forbidden to establish within a urban district without the consent of the council any offensive trade, business or manufacture. With regard to any offensive trade which has been established or may be engaged in within the district, the council may require the medical officer or any two legally qualified medical practitioners, or by any ten inhabitants of the district, to be a nuisance or injurious to health, the urban district council are required to take proceedings against the nuisance and to have notices served with a view to the abatement of the nuisance complained of.

Any medical officer or inspector of nuisances may inspect any meat, &c., exposed for sale or deposited in any place for the purpose of sale and examined, and for sale and intended for the food of mankind, where the Public Health Act 1890 has been adopted, extended to all articles intended for the food of man. If upon such inspection the meat, &c., appears to be diseased, unsound or injurious to health, or in any other way objectionable, or being condemned, and the person to whom the meat, &c., belongs or in whose possession it was found is liable to a penalty or, in the discretion of the justices, to imprisonment for three months without the option of a fine. The Public Health Acts contain important provisions relating to infectious diseases. Any person who knows he is suffering from an infectious disease must not carry on any trade or business which is unwholesome or likely to be injurious to health. Local authorities may require premises to be cleaned and disinfected; they may order the destruction of bedding, clothing or other articles which have been exposed to infection; they may prohibit the employment of persons placed in charge of the collection of sewage or other refuse; they may provide ambulances, &c. In the case of a person found suffering from infectious disease who has not proper lodging or accommodation, or is lodging in a room occupied by more than one family, the council may require the person or persons aggrieved by the order of the council to be removed to a hospital; a local authority may pay the expenses of a person in a hospital or, if necessary, provide nursing attendance; any person exposing himself or any other person to the risk of catching an infectious disease from an infected bed, clothing or the like, is made liable to a penalty. Owners and drivers of public conveyances must not knowingly convey any person suffering from infectious disease, and if any person is found to be conveyed in any public vehicle the owner or driver as soon as it comes to the notice of the council shall give notice to the medical officer. It is also forbidden to let houses or rooms in which infected persons have been lodging, or to make false statements to persons negotiating for the hire of such rooms. An act of 1895, and a further act of 1897, gives power to the local authority to provide for the segregation of infectious diseases. The Local Government Act 1891 created the office of the infectious diseases officer. The act of 1892 made it an offence to keep a ship, vessel, boat, tent, van, shed or similar structure used for human habitation in like manner as nearly as may be as if it were in the jurisdiction of any foreign government.
means of preventing the spread of infectious disease in modern times.

The district council are empowered to provide hospitals or temporary places for the reception of the sick. They may build them, buy them, or otherwise purchase them, or use the funds of the public for the provision of hospital accommodation, the county council may put in operation the Isolation Hospitals Act. The powers given to provide hospitals must be exercised so as not to create a nuisance, and much litigation has taken place in respect of the providing of hospitals for sanitary reasons.

Up to the present time, however, the courts have refused to accept as a principle that a smallpox hospital is necessarily a source of danger to the neighbourhood, and for the most part applications for the establishment of hospitals have failed. Where any part of the country appears to be threatened with or is affected by any formidable epidemic, endemic or infectious disease, the Local Government Board may make regulations for the speedy inspection of the sick. Such regulations are made and must also be approved of by house visitation, the provision of medical aid and accommodation, the promotion of cleansing, ventilation and disinfection, and the guarding against the spread of disease. Such regulations are made and must also be approved of by house visitation, the provision of medical aid and accommodation, the promotion of cleansing, ventilation and disinfection, and the guarding against the spread of disease. Such regulations are made and must also be approved of.

Mortuaries. Where the body of a person who has died, infected disease is retained in a room where persons live or sleep, or is allowed to remain in the body of another person who has died of disease on the certificate of a medical practitioner, the removal of a body to a mortuary and direct the body to be buried within a time limited by the local authority, and in default of such regulation of the district council, the district council may also maintain a proper place (otherwise than at a workhouse or a mortuary) for the reception of dead bodies during the time required to conduct any post mortem examination ordered by a coroner.

Under an act of 1879, the council has power to provide and maintain a cemetery either within or without their district, and they may purchase or accept a donation of land for that purpose. The provisions of the Cemeteries Acts 1874-1875 apply also to a cemetery within a district, and it cannot all be done here, but it may be noted that no part of the cemetery need be consecrated, but that if any part is, such part is to be defined by suitable marks, and a chapel in connection with the Established Church must be erected in the cemetery, and also provided with a suitable house for a chapel, and the land must be kept in repair, and the burial of dead bodies in the consecrated portion of the cemetery must be under the act of 1879 and in accordance with the provisions of the act. The power to provide a cemetery under the act of 1879 is exercised by the Local Government Board, and it must also be approved of by the Local Government Board.

The district council may resolve that the powers, duties and liabilities of the burial board shall be transferred to the council, and the council shall, accordingly, enter into the same act that the Burial Acts shall not hereafter be adopted in any urban rural parish without the approval of the urban council. The district council may resolve that the powers, duties and liabilities of the burial board shall be transferred to the council, and the council shall, accordingly, enter into the same act that the Burial Acts shall not hereafter be adopted in any urban rural parish without the approval of the urban council. The district council may resolve that the powers, duties and liabilities of the burial board shall be transferred to the council, and the council shall, accordingly, enter into the same act that the Burial Acts shall not hereafter be adopted in any urban rural parish without the approval of the urban council. The district council may resolve that the powers, duties and liabilities of the burial board shall be transferred to the council, and the council shall, accordingly, enter into the same act that the Burial Acts shall not hereafter be adopted in any urban rural parish without the approval of the urban council.

Highways. The power or duty in respect of highways except in a few cases where, by virtue of a provision in the Highway Act 1875, the rural sanitary authority of a district coincident in area with a parish has the powers and duties of a highway board. Exception to these ways, in which the powers and duties of a highway board are excluded, is a highway board. Except in these cases the highway authority in a parish was the surveyor of highways, elected annually by the inhabitants in vestry, or in a highway district consisting of a number of parishes, the highway authority was composed of waywardens representing the several parishes. By the Local Government Act 1894, there were transferred to the district council of every rural district all the powers, duties and liabilities of every other authority, surveyor or highway board within their district, and the former highway authorities ceased to exist. The highway authority in every district, rural as well as urban, is therefore the district council. Of the chief duties of the district council with regard to highways, the first and most obvious is the duty to repair. This duty was formerly enforceable by indictment of the inhabitants of the parish, but it is not quite clear whether this procedure is applicable, now that the liability to repair is transferred to a council representing a wider area. Under the Highway Acts it is enforceable by proceedings in a court where the duty to repair is transferred to a council, but in either case, if the liability to repair is not enforced, that question has to be decided on the facts of the case by the county council. In a rural district any parish council has the power to impose an order requiring the district council to pay its share of the cost of keeping any highway in repair, and the county council may then refer the question to the district council, and it is important to observe that, however, if such an action does not lie against a district council in respect of failure in the maintenance of a highway which has been made defective by negligence on the part of the council, or the duty of the council, they may appoint some person to do so at the cost of the district council. It is important to observe that, however, if such an action does not lie against a district council in respect of failure in the maintenance of a highway which has been made defective by negligence on the part of the council, or the duty of the council, they may appoint some person to do so at the cost of the district council.

While rural as well as urban district councils have the powers and duties of rural poor law boards, the provisions of the Public Health Acts relating to streets apply only to urban districts, and in so far as the Local Government Board may by order have conferred urban powers upon a rural district council, such boards, it is never necessary for the council to hold a meeting in a place remote from the parish, and the council may act for the purposes of the act in any place where the council may assemble. It is never necessary for the council to hold a meeting in a place remote from the parish, and the council may act for the purposes of the act in any place where the council may assemble. It is never necessary for the council to hold a meeting in a place remote from the parish, and the council may act for the purposes of the act in any place where the council may assemble. It is never necessary for the council to hold a meeting in a place remote from the parish, and the council may act for the purposes of the act in any place where the council may assemble. It is never necessary for the council to hold a meeting in a place remote from the parish, and the council may act for the purposes of the act in any place where the council may assemble. It is never necessary for the council to hold a meeting in a place remote from the parish, and the council may act for the purposes of the act in any place where the council may assemble. It is never necessary for the council to hold a meeting in a place remote from the parish, and the council may act for the purposes of the act in any place where the council may assemble. It is never necessary for the council to hold a meeting in a place remote from the parish, and the council may act for the purposes of the act in any place where the council may assemble.
Every district council may enter into such contracts as are necessary for carrying into execution the various purposes of the Public Health Acts. A district council being a corporation, the general law applies in the case of a rural council. With respect to contracts for public works, the exceptions to this rule including the doing of acts very frequently recurring or too insignificant to be worth the trouble of affixing the common seal. In the case of an urban council certain provisions of the Public Health Acts which are only applicable to the Metropolitan area and the Urban areas are excluded. For example, parks, public houses, slaughter-houses, etc., may be licensed without the consent of the urban authority to erect or bring forward any house or building in any street or any part of such house or building beyond the front main wall of the house or building on either side thereof.

The control exercised by an urban district council over streets and buildings is to a very large extent exercised through by-laws which are empowered to make for various purposes relating to the regulations of the construction of new buildings, the provision of sufficient air-spaces about buildings to secure a free circulation of air, and the provision of suitable and sufficient sanitary conveniences. The manner in which such by-laws are made and confirmed will be hereafter noticed. In general, the by-laws require plans of new streets to be submitted to the council, and they are required to approve or disapprove of these plans within a month. They cannot disapprove of a plan unless it contravenes the provisions of some statute or by-law: but if a person builds otherwise than according to an approved plan he does so at the risk of having his work pulled down or destroyed. Among the miscellaneous powers of an urban council with respect to streets may be mentioned the power to enforce, with respect to streets giving issue to the roads of the borough, the provisions of the Towns Improvement Clauses Act 1847, with respect to naming streets, numbering houses, improving the line of streets, removing obstructions, providing protection in respect of holes, and sidewalks. The Local Government Board have also a power to give direction for the laying out of streets, and during the construction and repair of sewers, streets and houses. An urban council may also provide for the lighting of any street in the district, and may contract with any person or company for that purpose. The corporation of the town and the council are empowered to enter into agreements for the supply of gas, and they may purchase the undertaking of any gas company in their district.

Public parks.

An urban council and the council of a borough may require and maintain lands for the purpose of being used as public walks or pleasure-grounds, and may support or contribute to the support of such walks or grounds if provided by any other person. They may also contribute towards the expenses of the laying out, or acquisition, or permanent maintenance of lands provided for this purpose by any person, in any of their own district, or outside that district, if it appears that the walks or grounds could eventually be used by the inhabitants of that district. An urban council may also provide public clocks or may be taken for the reasonable cost of repairing and maintaining any public clocks in the district, though not vested in them.

Markets and slaughter-houses.

Where an urban council, or the council of a borough, in other cases the owners of the owners of the ratepayers of the district, they may provide market accommodation for their district. They may not, however, establish any market so as to interfere with any market already established, and they may not provide for purposes of markets certain provisions of the Markets and Fairs Clauses Act 1847 are incorporated with the Public Health Act. The only one of these that need be noticed is that which provides that where a market is opened for public use, and is run by a licensed hawk or hawk, who shall sell or expose for sale in any place within the district, except in his own dwelling-place or shop, any articles in respect of which tolls are authorised to be taken shall not be sold without licence. The tolls may be taken by the urban council must be approved by the Local Government Board; and any by-laws which they make for the regulation of the market must be submitted to the board. An urban council may provide slaughter-houses, and they may make rules with respect to the cleanliness and charges for the use of them. Where they do not provide slaughter-houses, all previously existing slaughter-houses have to be registered and new ones licensed; and no person who has killed or slaughtered cattle or by-flasses may sell them as such, unless licensed. Licences may be suspended by justices in the event of their being used contrary to the provisions of the act or of the by-laws, and on a second conviction the licence may be revoked. Certain regulations are made as to having in his possession or on his premises unsound meat, the court may also revoke the licence.

Certain police regulations contained in the Town Police Clauses Act 1847 are by virtue of the Public Health Act 1875 in force in all urban districts. These relate to obstructions and nuisances in streets, fires, places of public resort, hackney carriage, and so on. These may be made by the proprietors, drivers and conductors of horses, ponies, mules or assels standing for hiring in the district in the same way as in the case of hackney carriages, and they may also license pleasure boats and vessels, and the boatmen or persons in charge thereof, and they may make by-laws for all these purposes.

Contracts, purchase of lands.

Finance.

The general rate is levied upon all urban and rural districts, and it is usually called the general rate or the general rate for the purposes of the local government. The general rate is levied upon all property, whether real or personal, and it is assessed on the rateable value of the property. The rateable value is the annual value of the property, as ascertained by the valuation officers of the local government, and it is assessed on the owner or occupier of the property.

There are three main sources of revenue for the local government: rates, grants from central government, and borrowings. Rates are the main source of revenue for local government, and they are levied on the rateable value of properties. Grants from central government are also a significant source of revenue, and they are used to fund a variety of services, including education, social services, and environmental protection. Finally, local authorities may borrow money to fund large capital projects, such as the construction of schools or hospitals. This borrowing is funded through loans from central government or by issuing bonds to investors.
Board to be special expenses. The expression "contributory place," means a place other than a parish chargeable with special expenses. For the most part it has reference only to what is called a special drainage district, that is to say, a district formed out of one or more parishes having special drainage purposes, or for the purpose of providing a common water-supply, or scheme of sewerage, or the like, and in the event of such a district including part only of a parish, the remaining portion would, so far as the special expenses for which the district was formed, be a separate contributory place; and all special expenses are chargeable to each parish or contributory place, and they are defrayed by means of special sanitary rates, such rates being raised on all property assessed to the relief of the poor, but with the consent of the occupier; or special funds may be raised under the general power mentioned under the head of general district rate in urban districts. The district councils are empowered to borrow with the sanction of the Local Government Board, subject to certain restrictions and regulations. The money must be borrowed for permanent works, and in the case of urban districts, by the Local Government Board to be spread over a term of years which must not exceed sixty. The sums borrowed must not exceed, with the outstanding loans, the amount of the assessable value for two years, and if the rates are not paid within one year, the assessment is reduced by the sum of the account with, and the rates owed, and the excess of the assessable value for one year, the sanction of the Local Government Board may not be granted except after local inquiry. The money may not be borrowed except for the improvement of land, principal or of principal interest, or by means of a sinking fund.

Where the urban council are the council of a borough, their accounts as urban council are made up and audited in the same way as are the accounts of a parish council. If the accounts are not audited, the case of the accounts of the council under the Municipal Corporations Act, but each of the borough auditors receives renumeration for auditing the accounts of the council as urban council and for the account of the Local Government Board for the accounts made up annually, and audited by the district auditor in the same effective manner as has already been mentioned in the case of the accounts of a county council. The accounts of a rural district council are made up half-yearly and are audited in the same way. The Public Authorities Protection Act 1893 was passed to repeal the numerous provisions contained in many acts of parliament, whereby, before legal proceedings could be taken against public bodies, it had to be proved that the proceedings commenced within a certain limited time. The act applies to all public authorities, including, of course, district councils, and it provides that action may be taken only on a complaint made to the council within the space of six months after the act, neglect or refusal to perform any duties under the act, or to dispense with the payment of any sum due to the council by any act done or omitted by the council, or in the case of a council for an act done in pursuance or execution, or intended execution, of an act of parliament, or of any public duty or authority, the action must be commenced within six months next after the act, neglect or refusal to perform any duties under the act, or to dispense with the payment of any sum due to the council by any act done or omitted by the council. It also provides that, in the event of the judgment of the court being given in favour of the council, the council shall be entitled to recover from the person in whose behalf the action was brought as between solicitor and client. Notice of action is abolished in every case. Among other acts which are either incorporated with the Public Health Acts or have been passed subsequently to them, one of the most important is the Housing of the Working Classes Act 1890. It contains three distinct parts. Under the first the urban district council may, by means of a scheme, acquire, rearrange and reconstruct an area which has been proved to be unhealthy and overcrowded, and relieve the housing accommodation. The Local Government Board, and carried out by means of a provisional order. The second part of the act deals with unhealthy dwellings, and requires the urban district council to take steps for the closure and destruction of unsuitable buildings, and for the protection of poor housing accommodation. The third part of the act deals with what is called in the act working-class lodging-houses. But the expression is a misleading one, for it includes separate houses or cottages for working-class purposes, and the effect of the act is that any house, whether a "cottage" or a house, may be a house for the purpose of the act if the estimated annual value of such house does not exceed £5. This part of the act may be adopted by a rural district council, but an urban district council can carry it into execution where they have been found to be overcrowded and destitute of proper sanitary arrangements.

The Bath and Wash-houses Act 1876 gives powers to the Board of Trade to form regulations for the construction and management of public baths and wash-houses in the maritime counties, and twothirds of the cost incurred in the construction of the building shall be defrayed by the Board of Trade, but the Board have power in certain cases to dispense with the consent of the local authority. Where the order is obtained by a person or body other than the district council, the council may purchase the undertaking at the end of twenty-one years after the tramways have been constructed or at the expiration of every subsequent period of seven years, and the terms of purchase are to be determined by the Board of Trade. The Act provides for the recovery of all sums paid in respect of the tramways, including the whole or part of the present value, exclusive of any allowance for past or future profits of the undertaking, or any compensation for compulsory sale or other consideration whatever of the tramways, and all lands, buildings, apparatus, and other matters whatsoever forming part of the tramways. It should be observed, however, that although the local authority may themselves construct, and may acquire from the original promoters a system of tramways, they may not do so without the special authority of the legislature, and such power must in general let the working of the undertaking to some person or company.

Under the Borough Funds Act 1872 the urban district council may, in their judgment it is expedient, promote or oppose any bill in Parliament for the acquisition of land, the purchase or sale, the construction or improvement of public works, or the prosecution or defend any legal proceedings necessary for the promotion or protection of the interests of the district, and may charge the costs incurred in so doing to the revenue of the district. In determining the amount of the purchase or sale, or the costs of any legal proceedings, however, is subject to several important restrictions. The resolution to promote or oppose the bill must in the first instance have been carried by an absolute majority of the council, and by the local government of the district, and must be confirmed by the ordinary resolution of the council. Moreover, the expenses must, before they can be charged to the rates, be examined and allowed by some person authorized by the secretary of state or the Local Government Board, as the case may be.

Under the Pawnbrokers Act 1872 the licences to pawnbrokers, which were formerly granted by justices, are now granted by district councils.

The Sale of Food and Drugs Acts certain important duties devolve upon medical officers and inspectors of nuisances who are officers of district councils. But for the most part the acts do not impose upon district councils themselves any special powers or duties, although, as a matter of course, they are responsible in the execution of the Acts. The councils, and the expenses of the execution of the acts are paid out of their funds. In quarter sessions boroughs, however, where the council have the duty of appointing a public analyst, they are responsible for the whole number of the council at a meeting continued by special notice, and after finding the same in any case the council or the council under the Rivers Pollution Prevention Act 1876 have been incidentally noticed when dealing with county councils, whose powers under the acts is precisely the same.
Acts 1894, there was nothing in the form of local government for a parish. It is true that the inhabitants in vestry had certain powers. They could adopt various acts, which will be more particularly referred to hereafter, and they could appoint the persons who were to carry these acts into execution. They elected the churchwardens and overseers, the highway surveyors, and the parish schools for their particular purposes, and the wardens if it was included in a highway district. But there was nothing in the nature of a representative body exercising any powers of government in the parish regarded as a separate area. Under the act of 1894 this was changed. In every rural parish, that is to say, in every parish which is not included within an urban district, there is a parish meeting, which consists of the parish council. As already stated, these are the persons whose names are on the parliamentary and local government registers. If the parish has a population exceeding 300, a parish council must be elected. If it has a population of 100 or upwards, the county council is bound to make an order for the election of a parish council if the parish meeting so resolves. Where there is no parish council, as will be seen hereafter, the various powers conferred upon a council are exercised by the parish meeting itself. Two or more parishes may be grouped together under a common parish council by order of the county council if the parish meetings of each parish consents. An annual meeting of every rural parish must be held in every year on the 4th day of March or within seven days before or after that date; and if there is no parish council, there must be at least one other parish meeting in the year. At the annual parish meeting the parish council, if there is one, is elected, and the members of the council, who originally held office for one year only, now, under a subsequent act, hold office for three years. Any person who is a parochial elector, or who has for twelve months preceding the election resided in the parish, or within 3 m. thereof, may be elected parish councillor, and the number of councillors is to be fixed from time to time by the county council, not being less than five nor more than fifteen. Women, whether married or single, are eligible.

The council is elected in manner provided by the rules of the Local Government Board. The rules now in force will be found in the Local Government Board Circular 177, "Parish Councils and Boards of Guardians," which are in force with reference to the elections of district councils, which have already been noticed. If a poll is demanded, it must be taken under the Ballot Act, as applied by the rules, and for all practical purposes it is meant. The parish council elects a chairman annually. He may be one of its own number, or some other person qualified to be a parish councillor. The council is a body corporate with a seal. It has power to appoint committees for its own parish or jointly with any other parish council.

Among the powers conferred upon a parish council are those of appointing overseers and of appointing and removing churchwardens. Churchwardens are no longer overseers, and the parish council may appoint as overseers a number of persons equal to the number formerly appointed as overseers and churchwardens. It may be useful to mention here that for purposes of the administration of the poor law, overseers no longer act, their duties in that respect having been superseded by the guardians. They remain, however, the rating authority so far as regards the poor rate and nearly all other rates, the exceptions being the district council rates and the borough rate in a borough, made by the town council. They still have power to give relief to poor persons in case of sudden and urgent necessity, but their principal duty is that of rating authority, and they are bound to make out the lists for the assessment of rates and Impost in the parish.

Powers to appoint overseers.

The parish and the parish council.

Powers and duties of parish councils.

The parish council may appoint a clerk, who may be either one of their own number without payment, or the assistant overseer, rate collector or some other fit person, with remuneration. The duties to be performed by the assistant overseer are those connected with the provision of parish books and of a vestry room or parochial office, parish chest, fire engine or fire escape, the holding or management of parish property, other than property relating to the subject of burials in the churchyard, the holding of parochial charity, the holding or management of village greens or of allotments, the appointment of trustees of parochial charities other than ecclesiastical charities in certain cases, and certain limited powers with reference to the supply of water to the parish. The actual control of these various powers is exercised by the assistant overseer, while the parish council holds the powers in trust for the benefit of the parish.

Among the most important of the matters which concern a rural parish is the administration of what are commonly called the adoptive acts. These include the following Acts: The Public Health Acts, the Public Health Act, the Public Health Act, the Public Health Act, the Public Health Act, and the Public Health Act. The Public Health Act was formerly adopted by a district council part of a parish, and if the electors of the parish who elected lighting inspectors, of whom one-third went out of office in every year. The inspectors took the necessary steps for having the parish lighted (the provisions as to lighting having been obsolete for many years), and the question of the rates for lighting the parish was placed upon the order of the council or the parish meeting at the beginning of the act. Now this act, like the other adoptive acts, can only be adopted by the parish meeting, and where adopted only for part of a parish, must be adopted by a parish meeting held for that part. The adoption of an act of the same description is vested in the parish council, if there is one, and, if not, by the parish meeting. The expenses are raised in the same manner as heretofore. The Bathes and Washhouses Acts, have already been mentioned in a previous year, it may be sufficient to say that they are now adopted and administered in a rural parish in the manner pointed out with reference to the Lighting and Watching Act. The same may be said of the Burial Acts, but these are sufficiently important to require special notice. These acts concern the rights of the parish whereby burials may be prohibited in urban districts, and churchyards or burial grounds already existing may be closed when full. Formerly, when the acts had been adopted by the parish council, it was unnecessary for the inhabitants to vest the acts into execution and provide and manage burial grounds. Now, in a rural parish which is coextensive with an area for which the acts have been adopted, the burial board is abolished and the acts are administered by the parish council, if there is one, or by the parish council and partly by the district council and partly by the parish council, or parish meeting. In a rural parish where there is no parish council, though the acts are adopted by the parish meeting, it is still necessary for the parish council to adopt and provide for the execution of the Burial Acts in the parish. The distinction between a burial ground and a cemetery provided under the Public Health Acts already mentioned, a burial ground, properly so called, has to be provided for by the parish council. The act also confers upon the parish council the power of appointing an overseer, who really takes the place of the parish churchwarden, and the incumbent of the parish church, the clerk, and the sexton continue to receive the same fees upon burials in the consecrated portion as from the past, but they have only the same fees upon burial in the unconsecrated portion. It has already been mentioned that a portion of the burial ground must be left unconsecrated. But this is subject to one important exception, that the parish meeting may unanimously resolve that the whole of the burial ground be declared unconsecrated. In that case, however, the parish council may, within ten years from the date on which a separate unconsecrated burial shall be provided for the parish. The expenses of the execution of the Burial Acts are provided by the overseers out of the poor rate upon the certificate of the surveyor of the district, and the amount of the same is apportioned between the parish and the district council.

Local Government.

Public Improvement Act.

Burial Acts.

Baths and Washhouses Acts.

The act provides for the enforcement of these acts by the parish council, or, if there is none, by the parish meeting. The act also provides for the enforcement of the act by the district council, or, if there is none, by the parish meeting. The act also provides for the enforcement of the act by the parish council, or, if there is none, by the parish meeting.
subscription or donation, and the rate must not exceed sixpence in the £.

The Public Libraries Act enables the authority adopting them to provide public libraries, museums, schools for science, art galleries and schools for art. The expenses in a rural parish are generally defrayed by the principal officers of the county council, or by the council itself. In a town or city, the poor-rate, with a qualification to the effect that agricultural land, market gardens and nursery grounds are to be assessed to the rate at one-third only of their rateable value. The amount of rates incurred at a parish meeting, exceed the amount of a rate of threepence in the £ for the financial year; but with the consent of the parish meeting it may be increased to sixpence, or upon the occurrence of an event of great consequence. A subscription is necessary to borrow, the consent of the parish meeting, and of the county council must be obtained. The expenses is payable out of the poor-rate by the overseers on the precept of the county council.

One of the most important powers conferred upon a parish council is that which enables them to prevent stoppage or diversion of any public right of way without their consent and without the approval of the parish meeting. The council may also complain to the county council that the district council has failed to provide a proper water-supply, or generally to enforce the provisions of the Burial Acts; and upon such complaint, if it were to be well founded, the county council may transfer to themselves the powers and duties of the district council, or may appoint a person to perform such powers and duties. In a parish which is not sufficiently large to have a parish council, most of the powers and duties conferred or imposed on the parish council are exercised by the district council. It is not necessary, however, for the local authorities to adopt the powers of a parish council. The Local Government Act 1894, the powers of a parish council are not already possessed by an urban district council, the local Government Board may by order confer such powers on the urban district council, or may authorise them to appoint one or more persons to act as the power to appoint overseers and assistant overseers, and in many cases urban councils have also obtained powers to appoint trustees of parochial charities.

The foregoing is a sketch of the scheme of local government carried out in England and Wales. No attempt has been made to deal with poor law (q.v.) or education (q.v.). The local administration of justice devolving upon the justices in quarter or petty sessions is hardly a matter of local government, although in one important respect, that is, in the licensing of premises for the sale of intoxicating liquors, it may be thought that the duties of justices fall within the scope of local government. It will be seen that the scheme, as at present existing, has for its object the simplification of local government by the abolition of unnecessary independent authorities, and that this has been carried out almost completely, the principal exception being that in some cases burial boards still exist which have not been superseded either by urban district councils or by parish councils or parish meetings. There are also some matters of local administration arising under what are called commissions of sewers. These exist for the purpose of regulating drainage, and providing defence against water in few lands or lands subject to floods from rivers or tidal waters. The commissioners derive their authority from the Sewers Commission Acts, which date from the time of Henry VIII., from the Land Drainage Act 1861, and from various local acts. It is unnecessary, however, to consider in any detail the powers exercised by commissioners of sewers in the few areas under their control.

General Bibliography

Among earlier works devoted to, or dealing largely with topography, a few may be mentioned out of a considerable mass. W. Camden, Britannia; De florentissimorum regnum Angliae, Scotiae, Hibernas . . . chorographia descripso (1556, 1st ed., 1656). Subsequent editions: in Latin, but translated by several successive writers both in Camden's time and later: Drayton, Poly-Olbion (a descriptive poem, first issued in a complete form in 1622); T. Fuller, History of the Writhe of England (1662); J. Leland, Itinerary, and Description of England (1549, ed. by Hearne respectively in 1710 and 1715; T. Cox and A. Hall, Modern History of Britain, in English); D. Defoe, Tour through the whole Island of Great Britain . . . divided into Circuits or Journeys (1724-1727); various works of Thomas Pennant, published between 1741 and 1765, and of William Burney, in which the author deals with the picturesque features of the British landscape, religion, topography, and ancient remains. On the geology of England and Wales, several standard works have been written, such as: James Sowerby, Microscopic Specimens of the Rock Formations of Great Britain, &c. (1810); W. M. Conybeare and J. Phillips, Geology of Devonshire (1822); Sir R. Lydekker, British Antiquities (1897); W. M. Conybeare and J. Phillips, Geology of Cornwall (1822), &c.

An account of the development of English topography may be found in: W. H. Old, The History of British Topography (1880); L. Gomme, The History of British Topography (1880); E. H. Bishop, The History of British Topography (1880); and many other works. The development of English topography is closely connected with the development of English literature, and is best studied in connection with the history of English literature. The study of English topography is also closely connected with the study of English history, and is best studied in connection with the history of English history. The study of English topography is also closely connected with the study of English history, and is best studied in connection with the history of English history.

finally revised in 1661, with the form of ordaining and consecrating bishops, priests and deacons, with the exception of the services for certain days which were abrogated in 1859; from the Xxxxix Articles (see creeds), published with royal authority in 1571; and from the First and Second Books of Homilies of 1540 and 1562 respectively, which are declared in Article xxxv, to contain sound doctrine.

Precursors.—Christianity reached Britain during the 3rd century, and perhaps earlier, probably from Gaul. An early tradition records the death of a martyr Alban at Verulamium, the present St Albans. A fully grown British Church existed in the 4th century: bishops of London, York and Lincoln attended the council of Arles in 314; the church assented to the council of Nicaea in 325, and some of its bishops were present at the council of Rimini in 359. The church held the Catholic faith. Britons made pilgrimages, to Rome and to Palestine, and some joined the monks who gathered round St Martin, bishop of Tours. Among these was Ninian, who preached to the southern Picts, and about 400 built a church of stone on Wigton Bay; its whiteness struck the people and their name for it is commemorated in the modern name Whithorn. From northern Britain, St Patrick (see patrick, St.) went to accomplish his work as the apostle of Ireland. Early in the 5th century British bishops, and, according to the historians, kings, of Ulster, Strathclyde, and the Isle of Man, were baptised by the heresiarch Baalbecius. Kilian, born in his time, built his church on the east coast of Ireland; and in 429 Germanus, bishop of Auxerre, and Lupus, bishop of Troyes, recalled the church to orthodoxy and, according to tradition, led their converts to victory, the "Hallelujah victory," over the Picts and Scots. When the Britons were hard pressed by Saxon invaders, large bodies of them found shelter in western Armorica, in a lesser Britain, which gave its name to Brittany. A British Church was founded there, and bishops, scholars and recluses of either Britain seem constantly to have visited the other. The Saxon invasion cut off Britain from communication with Rome; and the British Church having no share in the progressive life of the Roman Church, differences gradually arose between them. The organization of the British Church was monastic, its bishops being members, usually abbots, of monasteries, and not strictly diocesan, for the monasteries to which the clergy were attached had a tribal character. The monastic communities were large, Bangor numbered 2000 monks. From Gildas, a British monk, who wrote about 550, we gather that the bishops were rich and powerful and claimed apostolic precedence. The rulers, however, were too turbulent to be governed by a Church of clerical discipline; that simony was rife, and that bishops and clergy were neglectful. He evidently draws too dark a picture. For religious activity was not extinct. Gildas himself and others preached in Ireland, and from them the Scots, the dominant people of Ireland, received a ritual. The organization of the Scotch Church in Ireland was similar to that of the British Church. Its monastic settlements or schools were many and large, and were the abodes of learning. Bishops dwelt in them and were reverenced for their office, but each was subject to the direction of the abbot and convent. In 65 (? St Columba, the founder and head of several Scotch monasteries, left Ireland and founded a monastery in Hii or Iona, which afforded gospel teaching to the Scots of Dalriada and the northern Picts, and later did great work in evangelizing many of the Teutonic conquerors of Britain. By 602 the British Church, in common with the Irish Scots, followed practices which differed from the Roman use as it then was; it kept Easter at a different date; its clergy wore a different tonsure, and there was some defect in its creed. The Church of Britain, from its evangelists and Jutes — were heathens; the Britons gradually retreated before them to Wales, and in the west and northern districts, or dwelt among them either as slaves or as outlaws hiding in swamps and forests, and they made no attempts to evangelize the conquering race.

About 587 a Roman abbot, Gregory, afterwards Pope Gregory the Great, is said to have seen some English boys exposed for sale in Rome and asked of what people they were, of what kingdom and who was their king. They were "Angli," he was told of Deira, the modern Yorkshire, and their king was Ælle. "Not 'Angli,'" said he, "struck with the beauty of the fair-haired boys, but 'ængils' (angels), fleeing from wrath (de ino), and Ælle's people must sing Alleluia." He wished himself to go to a missionary to the English, but was prevented. After he became pope he sent a mission to England headed by Augustine. The way was prepared, for Æthelberht, king of Kent, had married a Christian, a Frankish princess Bertha, and allowed her to worship the true God. She brought with her a bishop who ministered to her in St Martin's church outside Canterbury, but evidently made no effort to spread the faith. Augustine and his band landed probably at Ebbsfleet in 597. They were well received by Æthelberht, who was converted and baptized. On the 6th of November Augustine was consecrated by the archbishop of Arles to be the archbishop of the English, and by Christmas had baptized 10,000 Kentish men. Thus the fathers of the English Church were Pope Gregory and St Augustine. Augustine restored a church of the Roman times at Canterbury to be the church of his see. The mission was reinforced from Rome; and Gregory sent directions for the rule of the infant church. There were to be two archbishops, at London and York; London, however, was not fully Christianized because of the Saxons' resistance, and Augustine, bishop of Canterbury, who had held two conferences with British bishops, gave them up their peculiar usages, conform to the Roman ritual, and join him in evangelizing the English. His hautiness is said to have offended them; they refused, and the English Church owes nothing to its British predecessor. The mission prospered, and bishops were consecrated for Rochester, and for London for the East Saxons. After Augustine and Æthelberht died a short religious reaction took place in Kent, and the East Saxons apostatized. In 627 Edwin, king of Northumbria, who had married a daughter of Æthelberht, was converted and baptized with his nobles by Paulinus, who became the first bishop of York. As Edwin's kingdom extended from the Humber to the Forth and included the Trent valley, while he exercised superiority over all the other English kingdoms, except Kent, his conversion promised well for the church, but he was slain and his kingdom overrun by Penda, the heathen king of Mercia, the central part of England. Penda's victories endangered the cause of Christianity. The Roman mission was destroyed but in 632 an East Anglian, Eata, was evangelized by Wulfhere, a Burgundian bishop sent from Canterbury, and settled in the faith. Though Bernicia, the northern part of Northumbria, was little affected by the gospel, and after Edwin's death heathenism became dominant in his kingdom, Christianity did not die out in Northumbria. The East Saxons had heard the gospel, and in 634 the conversion of the West Saxons was begun by Birinus, an Italian missionary. Central England and the South Saxons, however, were wholly untouched by Christianity.

The work of the Romans was taken up by Saxon missionaries. Oswald, under whom the Northumbrian power revived, had lived as an exile among the Scots, and asked them for a bishop to teach his people. Aidan was sent to him by the monks of Iona in 635, and fixed his see in Lindisfarne, or Holy Island, where he founded a monastery. Saintly, zealous and supported by Oswald's influence, he brought Northumbria generally to accept the gospel. The conversion of the Middle Angles and Mercians, and the reconversion of the East Saxons, were also achieved by Scots or by disciples of the Saxon mission. After Aidan's death in 651 the differences between the Roman and Saxon usages, and especially between the English and Latin, were found to be both inconvenient in practice, and must have hindered the church in its warfare against heathenism. Oswiu, who reigned over both the Northumbrian kingdoms, was, like his brother Oswald, a disciple of the Scots, his son and his queen, the daughter of Edwin, held to the Roman usages, and these usages were maintained by Wilfrid, who on his return from Rome in 658 was appointed abbot of Ripon. By Oswiu's command a conference between the two parties was held at the present Whitby in 664. Oswiu decided in favour of the Roman usages. This was the end of the Saxon
mission. The Scots left Lindisfarne, and their disciples generally adopted the Roman usages. The Scots were admirable missionaries, holy and self-devoted, and building partly on Roman foundations and elsewhere breaking new ground, they and their English disciples, as Cedd (St Chad), bishop of the Mercians, and Cuthbert, bishop of Lindisfarne, who were by no means inferior to their teachers, almost completed the conversion of the country. But they practised an excessive asceticism and were apt to abandon their work in order to live as hermits. Great as were the benefits which the English derived from their teaching, its cessation was not altogether a loss, for the church was passing beyond the stage of mission teaching and needed organization, and that it could not have received from the Scots.

Its organization like its foundation came from Rome. An archbishop-designate who was sent to Rome for consecration having died there, Pope Vitalian in 668 consecrated Theodore of Tarsus as archbishop of Canterbury. The Scots had no diocesan system, and the English bishoprics were vast in extent, followed the lines of the kingdoms and varied with their fortunes. The church had no system of government nor means of legislation. Theodore united it in obedience to himself, instituted national synods and subdivided the over-large bishoprics. At his death, in 690, the English dominions were divided into fourteen dioceses. Wilfrid, who had become bishop of Northumbria, resisted the division of his diocese and appealed to the pope. He was imprisoned by the Northumbrian king and was exiled. While in exile he converted the South Saxons, and their conversion led to that of the Isle of Wight, then subject to them, in 868, which completed the evangelization of the English. After long strife Wilfrid, who was supported by Rome, regained a part of his former diocese. Theodore also gave the church learning by establishing a school at Canterbury, where many gained knowledge of the Scriptures, of Latin and Greek, and other religious and secular subjects. In the north learning was promoted by Benedict Biscop in the sister monasteries which he founded at Wearmouth and Jarrow. There Bede (q.v.) received the learning which he imparted to others.

In the year of Bede's death, 731, several of his disciples, Egbert, bishop of York, became the first archbishop of York, Gregory III. giving him the pallium, a vestment which conferred archiepiscopal authority. He established a school or university at York, to which scholars came from the continent. His work as a teacher was carried on by Alcuin, who later brought learning to the court and Frankish dominions of Charlemagne. The infant church, following the example of the Irish Scots, showed much missionary zeal, and English missionaries founded an organized church in Frisia and laboured on the lower Rhine; two who attempted to preach in the old Saxon land were martyred. Most famous of all, Winfrid, or St Boniface, the apostle of Germany, preached to the Frisians, Hessians and Thuringians, founded bishoprics and monasteries, became the first archbishop of Mainz, and in 754 was martyred in Frisia. He had many English helpers, some became bishops, and some were ladies, as Thecla, afterwards queen of bergen, and Llúcia, abbess of Bischofsheim. After his death, Wilfrid, who had laboured in Frisia, was elected at the bidding of Charlemagne, among the Saxons, and became the first bishop of Bremen. Religion, learning, arts, such as transcription and illumination, flourished in English monasteries. Yet heathen customs and beliefs lingered on among the people, and in Bede's time there were many pseudo-monasteries where men and women made monasticism a cloak for idleness and vice. In the latter part of the 8th century Mercia became the predominant kingdom under Offa, and he determined to have an archbishop of his own. By his contrivance two legates from Adrian I. held a council at Chelsea in 787 in which Lichfield was declared an archbishopric, and seven of the twelve suffragan bishoprics of Canterbury were apportioned to it. In 802, however, Leo III. restored Canterbury to its rights and the Lichfield archbishopric was abolished.

The rise of Wessex to power seems to have been aided by a good understanding between Egbert and the church, and his successors employed bishops as their ministers. Æthelberht, who was specially welcomed by ecclesiastical influence, went on a pilgrimage to Rome, and before his departure made large grants for pious uses. His donation, though not the origin of tithes in England, illustrates the idea of the sacredness of the tenth of income on which laws enforcing the payment of tithes were founded. His pilgrimage was probably undertaken in the hope of averting the attacks of the pagan Danes. Their invasions fell heavily on the church; priests were slaughtered and churches sacked and burnt. Learning disappeared in Northumbria, and things were little better in the south. Bishops fought and fell in battle, the clergy lived as laymen, the monasteries were held by married canons, heathen superstitions and immorality prevailed among the laity. Besides bringing the Danish settlers in East Anglia to profess Christianity in 878, Alfred set himself to improve the religious and intellectual condition of his own people (see Alfred). The gradual reconquest of middle and northern England by his successors was accompanied by the conversion of the Danish population. A revival of religion was effected by churchmen inspired by the reformed monasticism of France and Flanders, by Odo, archbishop of Canterbury, Oswald, archbishop of York, and Dunstan (see Dunstan), who introduced from abroad the strict life of the new Benedictinism. King Edgar promoted the monastic reform, and by his authority Bishop Æthelwold of Winchester turned canons out of the monasteries and put monks in their place. Dunstan sought to reform the church by ecclesiastical and secular legislation, forbidding immorality among laymen, insisting on the duties of the clergy, and compelling the payment of tithes and other church dues. After Edgar's death an anti-monastic movement, chiefly in Mercia, nearly ended in civil war. In this strife, which was connected with politics, the victory on the whole lay with the monks' party, and in many cathedral churches the chapters remained monastic. The renewed energy of the church was manifested by councils, canonical legislation and books of sermons. In the homilies of Abbot Ælfric, written for Archbishop Sigeric, stress is laid on the purely spiritual presence of Christ in the Eucharist, but his words do not indicate, as some have believed, that the English Church was not in accord with Rome. The ecclesiastical revival was short-lived. Renewed Danish invasions, in the course of which Archbishop Alphege was martyred in 1012, and a decline in national character, injuriously affected the church and, though in the reign of Canute it was outwardly prosperous, spirituality and learning decreased. Bishoprics and abbacies were rewards of service to the king, the bishops were worldly-minded, plurality was frequent, and simony not unknown. Edward the Confessor promoted foreign ecclesiastics; the connexion with Rome was strengthened, and in 1062 the first legates since the days of Offa were sent to England by Alexander II. A political conflict led to the banishment of Robert, the Norman archbishop of Canterbury. An Englishman Stigand received his see, but was excommunicated at Rome, and was regarded even in England as schismatic. When William of Normandy planned his invasion of England, Alexander II., by the advice of Hildebrand, afterwards Gregory VII., moved Frankish churchmen and the English Church under the influence of the Cluniac revival and into closer relation with Rome, gave the duke a consecrated banner, and the Norman invasion had something of the character of a holy war.

Before the Norman Conquest the church had relapsed into deadness: English bishops were political partisans, the clergy were married, and discipline and asceticism, then the recognized condition of holiness, were extinct. The Conqueror's relations with Rome ensured a reform; for the papacy was instinct with the Cluniac spirit. In 1070 papal legates were received and held a council by which Stigand was deposed. Lanfranc, abbot of Bec, was appointed archbishop of Canterbury and worked harmoniously with the king in bringing the English Church up to the level of the church in Normandy. Many native bishops and abbots were deposed, and the Norman prelates who succeeded them were generally of good character, strict disciplinarians, and men of grander ideas. A council of 1075 decreed the removal of bishops' sees.
from villages to towns, as on the continent; the see of Sherborne, for example, was removed to Old Sarum, and that of Selsey to Chichester, and many churches staller than of old were built in the Norman style which the Confessor had already adopted for his church at Westminster. In another council priests and deacons were thenceforward forbidden to marry. William and Lanfranc also worked on Hildebrandine lines in separating ecclesiastical from civil administration. Ecclesiastical affairs were regulated in church councils held at the same time as the king's councils. Bishops and archdeacons were no longer to exercise their spiritual jurisdiction in secular courts, as had been the custom, but in ecclesiastical courts and according to canon law. The king, however, ruled church as well as state; Gregory granted him control over episcopal elections, he invested bishops with the crozier and they held their temporalities of him, and he allowed no councils to meet and no business to be done without his licence. Gregory claimed homage from him; but while the king promised the payment of Peter's pence and such obedience as an English bishop had rendered, he refused homage; he allowed no papal letters to enter the kingdom without his leave, and when an anti-pope was set up, he and Lanfranc treated the question as to which pope should be acknowledged in England as one to be decided by the crown. The Conquest brought the church into closer connexion with Rome and gave it a share in the religious and intellectual life of the continent; it stimulated and purified English monasticism, and it led to the organization of the church as a body with legislative and administrative powers distinct from those of the state. The relations established by the Conqueror between the crown, the church and the pope, its head and supreme judge, worked well as long as the king and the primate were agreed, but were so complex that trouble necessarily arose when they disagreed. William Rufus tried to feudalize the church, to bring its officials and lands under feudal law; he kept bishoprics and abbacies vacant and confiscated their revenues. He quarrelled with Anselm (q.v.) who succeeded Lanfranc. Anselm, while at Rome, heard the investiture of prelates by laymen denounced, and he maintained the papal decree against Henry I. Bishops were vassals of the king, holding lands of him, as well as officers of the church. How were they to be appointed? Who should invest them with the symbols of their office? To whom was their homage due? (see Investiture). These questions which agitated western Europe were settled as regards England by a compromise: Henry surrendered investiture and kept the right to homage. The substantial gain lay with the crown, for, while elections were theoretically free, the king retained his power over them. Though Henry in some degree checked the exercise of papal authority in England, appeals to Rome without his sanction were frequent towards the end of his reign. Stephen, who had obtained the recognition of his title from Innocent II., and was upheld by the church until he violently attacked three bishops who had been Henry's ministers. The clergy then transferred their allegiance to Matilda. His later quarrel with the papacy, the murder of Monk of St Bernard, added to his embarrassments and strengthened the Angevin cause. During Stephen's reign the church grew more powerful than was for the good either of the state or itself. Its courts encroached on the sphere of the lay courts, and further claimed exclusive criminal jurisdiction over all clerks whether in holy or minor orders, with the result that criminal clerks, though degraded by a spiritual court, escaped temporal punishment. Henry II., finding ecclesiastical privileges an obstacle to administrative reform, demanded that the bishops should agree to observe the ancient customs of the realm. These customs were, he asserted, expressed in certain constitutions to which he required their assent at a council at Clarendon in 1164. In spirit they generally maintained the rights of the crown as they existed under the Conqueror. One provided that clerks convicted of temporal crime in a spiritual court and degraded should be sentenced by a lay court and punished as laymen. Archbishop Becket (see Becket) agreed, repented and refused his assent. The king tried to ruin him by unjust demands; he appealed to Rome and fled to France. A long quarrel ensued, and in 1170 Henry was forced to reconcile to Becket. The archbishop's murder consequent on the king's hasty words shocked Christendom, and Henry did penance publicly. By agreement with the pope he renounced the Constitutions, but the encroachments of the church courts were slightly checked, and the king's decisive influence on episcopal elections and some other advantages were secured. The church in Wales had become one with the English Church by the voluntary submission of its bishops to the see of Canterbury in 1129 and later. The Irish Church remained distinct, though the conquest of Ireland, which was sanctioned by the English pope Adrian IV. (Nicholas Breakspear), brought it into the same relations with the crown as the English Church and into conformity with it. Under the guidance of ecclesiastics employed as royal ministers, the church supported the crown until, in 1216, Innocent III. refused to confirm the election of a bishop nominated by King John to Canterbury; and represented of the monks of Christ Church, in whom lay the right of election, being at his court, the pope bade them elect Stephen Langton whom he consecrated as archbishop. John refused to give Langton and seized the estates of Christ Church. Innocent laid England under an interdict in 1208; the king confiscated the property of the clergy, banished bishops and kept sees vacant. Papal envoys excommunicated him and declared him deposed in 1211. Surrounded by enemies, he made his peace with the pope in 1213, swore fealty to him before his envoy, acknowledged that he held his kingdom of the Roman see, and promised a yearly tribute for England and Ireland. Finally he surrendered his crown to a legate and received it back from him. The banished clergy returned and an agreement was made as to their losses. Langton guided the barons in their demands on the king which were expressed in Magna Carta. The first clause provided, as charters of Henry I. and Stephen had already provided, that the English Church should be "free," adding that it should have freedom of election, which John had promised in 1214. As John's suzerain, Innocent annulled the charter, consecrated Langton and excommunicated the barons in arms against the king. On John's death, Guala, legate of Honorius III., with the help of the earl marshal, secured the throne for Henry III., and he and his successor Pandulf, as representatives of the young king's suzerain, largely directed English affairs until 1221, when Pandulf's departure restored Langton to his rightful position as head in England of the church. Reforms in discipline and clerical work were inculcated by provincial legislation, and two legates, Otto in 1237 and Ottoboni in 1268, promulgated in councils constitutions which were a fundamental part of the canon law in England. Religious life was quickened by the coming of the friars (see Friars). Parochial organization was strengthened by the institution of vicars in benefices held by religious bodies, which was regulated and enforced by the bishops. It was a time of intellectual activity, in character rather cosmopolitan than national. English clerks studied philosophy and theology at Paris or at law at Bologna; some remained treasures of learning and art, and were famous as scholars. Archbishops Langton, and Edmund Rich, and Bishop Grosseteste returned to be rulers of the church, and others like Roger Bacon to continue their studies in England. The schools of Oxford, however, had already attained repute, and Cambridge began to be known as a place of study. The spirit of the age found expression in art, and English Gothic architecture, though originally, like the learning of the time, imported from France, took a line of its own and struck its climax at this period. Henry's gratitude for the benefits which in his early years he received from Rome was shown later in subservience to papal demands. Gregory IX., and still more Innocent IV., sorely in need of money to prosecute their struggle with the imperial house, laid grievous taxes on the English clergy, supported the king in making heavy demands upon them, and violated the rights of patrons by appointing to benefices by "provisions" often in favour of foreigners. Churchmen, and prominently Grosseteste, the learned and holy bishop of Lincoln, while...
recognizing the pope as the divinely appointed source of all ecclesiastical jurisdiction, were driven to resist papal orders which they held to be contrary to apostolic precepts. Their remonstrances were seldom effectual, and the state of the national church was noted by the Provisions of Oxford in 1258 as part of the general misgovernment which the baronial opposition sought to remedy. The alliance between the crown and the papacy in this reign diminished the liberties of the church.

Edward I., who was a strong king, checked an attempt to magnify the spiritual authority by the writ *Cum specie agetis*, which defined the sphere of the ecclesiastical courts, put a restraint on religious endowments by the Statute of Mortmain, and desiring that every estate in the realm should have a share in public burdens and counsels, caused the beneficed clergy to be summoned to send proctors to parliament. The clergy preferred to make their grants in their own convocations, and so lost the position offered to them. For some years clerical taxation by the crown was carried on with the good-will of the papacy; it was not oppressive for the beneficed clergy and incomes below ten marks were exempt, and in theory the clergy were celibate. Papal claims were added to in 1296 by the bull *Clerics laicos*, forbade the clergy to grant money to lay princes, and Edward’s request for a clerical subsidy was in 1297 refused by the pope. Edward was determined to limit the bishoprics and to replace the baronial opposition which forced Edward to grant the “Confirmation of the Charters.”

Edward procured his disgrace from Clement V., and in return allowed Clement to exact so much from the church that the doings of the papal agents provoked an indignant remonstrance from parliament in 1307. With that exception the king’s dealings with the church were statesmanlike. He employed clerical ministers and paid them by church preferments, but his nominations to bishoprics did not always receive papal confirmation which had become recognized as essential. His weak son Edward II. yielded readily to papal demands; however, he was the last of the bishops of the realm, and specially those engaged in politics, were unworthy men; religion was at a low ebb; plurality and non-residence were common. By the constitution *Excrabitis* John XXII. ordered that all cures held in plurality save one should be vacated, and, which was not so well, “reserved all” benefices so vacated for his own appointment. As the residence of the popes at Avignon from 1308 to 1377 brought them under French influence, Englishmen during the war with France were specially displeased that large sums should be drawn from the kingdom for them and that they should exercise patronage there.

In the reign of Edward III. the popes, though appointing to bishoprics by provision, did not give them to foreigners, but they appointed foreigners, enemies of England, to lesser preferments, deaneries and prebends. In 1351 the Statute of Provisors declared provisions unlawful. Capitular elections, however, remained mere forms; the king nominated, and the pope provided, and took advantage of their claim to appointment. In 1355, however, the dealing with temporalities was checked by a law of 1355 (the first statute of *Proaemunire*), which made punishable by outlawry and forfeiture the carrying before a foreign tribunal of causes cognizable by English courts. This measure was extended in 1365, and in 1393 by the great statute of *Proaemunire*.

Indignant at the law of 1365, Urban V. demanded payment of the tribute promised by John, which was then thirty-three years in arrear, but parliament repudiated the claim. The Black Death disorganized the church by thinning the ranks of the clergy, who did their duty manfully during the plague. In the diocese of Norwich, for example, 800 parishes lost their incumbents in 1349, 83 of them twice over. Large though insufficient numbers were instituted to benefices and unlit persons received holy orders. The value of livings decreased and many lay vacant. Some incumbents deserted their parishes to take stipendiary work in towns or secular

employments, and beneficed clergy demanded higher stipends. Greediness infected the church in common with society at large. Yet Chaucer’s ideal parish priest must have represented a familiar type, so that we may believe that much good work was here and there unobtrusively done by the clergy. Prominent among abuses were the sale of pardons, and the extortions of the ecclesiastical courts; their decrees were enforced by excommunication, and on a writ issued to the sheriff an excommunicated person would be imprisoned until he satisfied the demands of the church. The state needed money and attacks were made in parliament on the wealth of the church. Already, in 1340, Edward III., who quarrelled with Archbishop Stratford on political grounds, had appointed lay ministers, and in 1371 William of Wykeham, bishop of Winchester, and other clerical ministers were turned out of office and succeeded by laymen. A political crisis in 1376 was followed by a struggle between the bishops and John of Gaunt, duke of Lancaster, the head of the anticlerical party, who allied himself with John Wycliffe (q.v.). He was unpopular, and when the bishops cited Wycliffe before them in St. Paul’s, the duke’s conduct provoked a riot and the proceedings ended abruptly. Wycliffe held that the church was corrupted by wealth; that only those in grace had a right to God’s gifts; and that temporal power belonged only to laymen and not to popes nor priests. Later he attacked the papacy itself, which in 1378 was distracted by the great schism; by 1380 he condemned pilgrimages, secret confession and masses for the dead. While holding the presence of Christ in the Eucharist, he denied a change of substance in the elements, arguing that accidents or qualities, such as form and colour, could not exist without substance. He taught that the Holy Scripture was the only source of religious truth, to the exclusion of church authority and tradition, and he and his followers made the first complete English version of the Bible. His opinions were spread by the poor priests whom he sent out to preach and by his English tracts. That his teaching had any direct effect on the insurrection of 1381, though commonly believed, appears to be an unfounded idea; many priests were concerned in the rising, and specially the mendicant orders, Wycliffe’s bitter enemies, but the motives of the insurrection were essentially political, *The Great Revolt of 1381*. The reaction which followed extended to religious, and Wycliffe’s doctrines were condemned by a church council in 1382. Nevertheless he died in peace. He had many disciples, especially in Oxford and in industrial centres. The Lollards, as his followers were called, had supporters in parliament and among people of high rank in the court of Richard II., and the king’s marriage to Anne of Bohemia brought about the importation of Wycliffe’s writings into Bohemia, where they had a strong influence on the religious movement led by Hus. At first the bishops were not inclined to persecute, and the earlier Lollards mostly recanted under pressure, but their number increased.

With the accession of the Lancastrian house the crown allied itself with the church, and the bishops adopted a repressive policy towards the Lollards. By the canon law obstructane heretics were to be burnt by the secular power, and though England had hitherto been almost free from heresy, one or two burnings had taken place in accordance with that law. In a papal bull, *De hereticis comulating*, ordered that heretics convicted in a spiritual court should be committed to the secular arm and publicly burned, and, while this statute was pending, one Sawtry was burned as a relapsed heretic. Henry V. was zealous for orthodoxy and the persecution of Lollards increased; in 1414 Sir John Oldcastle, Lord Cobham, who had been condemned as a heretic, escaped and made an insurrection; he was taken in 1417 and hanged and burned. Lollardism was connected with an insurrection in 1412: it then ceased to have any political importance, but it kept its hold in certain towns and districts on the lower classes; many Lollards were forced to recant and others suffered martyrdom. The church was in an unsatisfactory state. As regards the papacy, the crown generally maintained the position taken up in the previous century, but its policy was fitful, and the custom of allowing bishops who were made cardinals to retain their sees
ENGLAND, CHURCH OF

The Reformation era

1447

strengthened papal influence. The bishops were largely engaged in secular business; there was much plurality, and cathedral and collegiate churches were frequently left to inferior officers whose lives were scandalous. The clergy were numerous and drawn from all classes, and humble birth did not debar a man from attaining the highest positions in the church. Candidates for holy orders were still examined, but clerical education seems to have declined. Preaching was rare, partly from neglectfulness and partly because, in 1401, in order to prevent the spread of heresy, priests were forbidden to preach without a licence. While the marriage of the clergy was checked, irregular and temporary connexions were lightly condoned. Discipline generally was lax, and exhortations against field-sports, tavern haunting and other unclerical habits seem to have had little effect. Monasticism had declined. Papal indulgences and relics were hawked about chiefly by friars, though these practices were disannounced by the bishops. On the other hand, all education was carried on by the clergy, and religion entered largely into the daily life of the people, into their gild-meetings, church-ales, mystery-plays and holidays; and as a result there came into existence the Perpendicular style of church architecture which prevails to this day. The revival of classical learning scarcely affected the church at large. Greek learning was regarded with suspicion by many churchmen, but the English clergy were orthodox. The movement had little to do with the coming religious conflicts, which indeed killed it, save that it awoke in some learned men like Sir Thomas More a desire for ecclesiastical, though not doctrinal, reform, and led many to study the New Testament of which Erasmus published a Greek text and Latin paraphrases.

During the earlier years of the 16th century Lollardism still existed among the lower classes in towns, and was rife here and there in country districts. Persecution went on and martyrs roamed the land. The old grievances concerning ecclesiastical exactions remained unabated and were further strengthened by an ill-founded rumour that Richard Hunne, a Londoner who had refused to pay a mortuary, was imprisoned for heresy in the Lollard's tower, and was found hanged in his cell in 1514, had been murdered. Lutheranism affected England chiefly through the surreptitious importation of Tyndale's New Testament and heretical books. In 1521 Henry VIII. wrote a book against Luther in which he maintained the papal authority, and was rewarded by Leo X. with the title of Defender of the Faith. Henry, however, whose will was to himself as the oracles of God, finding that the pope opposed his intended divorce from Catherine of Aragon, determined to allow no supremacy in his realm save his own. He carried out his ecclesiastical policy by parliamentary help. Parliament was packed, and was skillfully managed; and he had on his side the popular impatience of ecclesiastical abuses, a new feeling of national pride which would brook no foreign interference, the old desire of the laity to lighten their own burdens by the wealth of the church, and a growing inclination to question or reject sacerdotal authority. He used these advantages to forward his policy, and when he met with opposition, enforced his will as a despot. The parliament of 1529 lasted until 1536; it broke the bonds of Rome, established royal supremacy over the English Church, and effected a redistribution of national wealth at the expense of the spirituality. It began by acts abolishing ecclesiastical exactions, such as excessive mortuaries and fees for probate, and by prohibiting pluralities except in stated cases, application to Rome for licence to evade the act being made penal. Henry having crushed his minister Cardinal Wolsey, archbishop of York, declared the whole body of the clergy involved in a praemunire by their submission to Wolsey's legislative authority, and ordered the convocation to purchase pardon by a large payment, and by acknowledging him as "Protector and Supreme Head of the English Church and Clergy." After much debate, the acknowledgment was made in 1533, with the qualification "so far as the law of Christ allows." A "supplication against clerical jurisdiction and legislation by convocation was obtained from the Commons in 1533, and Henry received from construction "of the submission of the clergy," surrendering its legislative powers to the crown and consenting to a revision of the canon law by commissioners to be appointed by the king. A bill for conditionally withholding the payment of annates, or first-fruits, to Rome was passed, and Henry took advantage of the fear of the Roman court lest it should lose these payments, to obtain without the usual fees bulls promoting Cranmer to the see of Canterbury in 1533, and thus was enabled to gain his divorce. Cranmer pronounced his marriage to Catherine null, and declared him lawfully married to Anne Boleyn. Clement VII. retorted by excommunicating the king, but for that Henry cared not. Appeals to Rome were forbidden by statute, and the council ordained that the pope should henceforth only be spoken of as bishop of Rome, as not having authority in England. In 1534 the restraint of annates was confirmed by law, all payments to Rome were forbidden, and it was enacted that, on receiving royal licence to elect, cathedral chapters must elect bishops nominated by the king. The papal power was extirpated by statute, parliament at the same time declaring that neither the king nor kingdom would vary from the "Catholic faith of Christendom." The submission of the clergy was made law. Appeals from the archbishops' courts were to be to the king in chancery, and were to be heard by commissioners, whence appeals to the Court of Delegates as the court of final appeal in ecclesiastical cases. The deaneries and tenures of benefices were given to the king, and his title as "Supreme Head of the Church of England" was declared by parliament without the qualification added by convocation. Fisher, bishop of Rochester, and Sir Thomas More, lately chancellor, the two most eminent Englishmen, were beheaded in 1535 on an accusation of attempting to deprive the king of this title, and some Carthusian monks suffered a more cruel martyrdom in the same cause. Meanwhile New Testaments were burnt, and heretics, or reformers, forced to abjure or, remaining steadfast, were sent to the stake, for though the heresy law of Henry IV. was repealed, heresy was still punishable by death, and persecution was not abated. By breaking the bonds of Rome Henry did not give the church freedom; he substituted a single despotism for the dual authority which pope and king had previously exercised over it. In 1535 Cromwell, the king's vicar-general, began a visitation of the monasteries. The reports (compters) of his commissioners having been delivered to the king and communicated to parliament in 1536, parliament declared the smaller monasteries corrupt, and granted the king all of less value than £200 a year. A rebellion in Lincolnshire and another in the north, the formidable Pilgrimage of Grace, followed. The suppression of the greater houses was effected gradually, surrenderers were obtained by pressure, and three archbishops who were reluctant to give up the possessions of their convents for confiscation were hung. Monastic shrines and treasures were sacked and the spoil sent to the king, to whom parliament granted all the houses, their lands and possessions. Of the enormous wealth thus gained Henry spent a part on national defence, a little on the foundation of the bishoprics of Westminster, dissolved in 1550, Bristol, Chester, Gloucester, Oxford and Peterborough, and gave the lands to men either useful to or favoured by himself, or sold them to rich purchasers. In 1536 he dictated the belief and ceremonial of the church by issuing Ten Articles which were subscribed by conviction. This first formulary of the English Church as separate from Rome did not contravene Catholic doctrine, though it showed the influence of Lutheran models. Another exposition of Anglican doctrine was made in the Institution of a Christian Man or "Bishops' book," in some respects more likely to satisfy those attached to the tenets of Rome, in others, as in the distinct repudiation of purgatory and the declaration that salvation depended solely on the merits of Christ, showing an advance. It was published in 1537 with Henry's sanction but not by authority. In that year licence was granted for the sale of a translation of the Bible, and in 1538 another version called Matthew's Bible, was ordered to be kept in all churches (see
Bible). Pilgrimages were suppressed and images used for worship destroyed. Denial of the king's supremacy, denial of the corporal presence in the Eucharist, and insulti to Catholic rites were alike punished by cruel death. The publication abroad of the king's excommunication rendered an assertion of orthodoxy advisable for political reasons, and in 1539 came the Act of the Six Articles attaching extreme penalties to deviations from Catholic doctrines. The backward swing of the pendulum continued; Cromwell was beheaded and three reforming preachers were burnt in 1540. Prosecutions for heresy under the act were stiffl: four gospellers were burnt in London in 1546, of whom the celebrated Anne Askew was one. Cranmer, however, did not lose the king's favour. A fresh attempt to define doctrine was made in the Necessary Doctrine and Erudition of a Christian Man, the “King's Book,” published by authority in 1543, which, while repudiating the pope, was a declaration of Catholic orthodoxy. A Primer, or private prayer-book, of which parts were in English, as the litany composed by Cranmer, and virtually the same as at present, was issued in 1546, and further liturgical change seemed probable when Henry died in 1547.

Henry, while changing many things in the church, would not allow any deviation in essential points. The Act of Uniformity of 1550 was in theory, and dogmatically as it was later by the council of Trent. Edward VI. was a child, and the Protector Somerset and the council favoured further changes, which were carried out with Cranmer's help. They issued a book of Homilies and a set of injunctions which were enforced by a royal visitation. Pictures and much painted glass were destroyed in churches, frescoed walls were whitewashed, and in 1548, the removal of all images was decreed. Parliament ordered that bishops should be appointed by letters patent and hold their courts in the king's name. An act of the last reign granting the king all chantries and gilds was enlarged and enforced with cruel injustice to the poor. On the petition of convocation parliament allowed the marriage of priests; and it further ordered that the laity should receive the cup in communion. A communion book was issued by the council in English, the Latin mass being retained for a time. Many German reformers came to England, were favoured by the council, and gained influence over Cranmer. The first Book of Common Prayer was authorized by an Act of Uniformity in 1549, and retained much from old service books, but the communion office is Lutheran in character. It excited discontent, and a serious insurrection broke out in the West, the insurgents demanding the revival of the Act of the Six Articles and the withdrawal of the new service as “like a Christmas game.” After Somerset's fall the government rapidly pushed forward reformation. A new Ordinal issued with parliamentary approval in 1550 was significant of the change in sacramental doctrine, and the four minor orders disappeared. Altars were destroyed and tables substituted. Five bishops, Bonner of London, Gardiner of Winchester, and Heath of Worcester, then already in prison, and two others, were deprived; and the Lady Mary, who would not give up the mass, was harshly treated. The reformers were not tolerant; for a woman was burnt for Anabaism in 1550 and a man Anabaptist in 1531. Under the influence of foreign reformers, who took a lower view of the Eucharist than the Lutheran divines, Cranmer soon advanced beyond the prayer-book of 1549. A second prayer-book, departing further from the old order, appeared in 1552, and without being accepted by the people, was pronounced to be in conformity with Cranmer's views in 1553 a catechism and forty-two articles of religion were authorized by Edward for subscription by the clergy, though not laid before convocation. A revision of the canon law in accordance with the act for “submission of the clergy” was at last undertaken in 1552, but the only result was a document entitled Reformatio legum ecclesiasticorum, which never received authority. Edward died in 1553. Apart from matters of faith, the church had fared ill under a royal supremacy exercised by self-seeking nobles in the name of the boy-king. Convocation lost all authority and bishops were treated as state officials liable to deprivation for disobedience to the council. Means of worship were diminished, and the poor were shamefully wronged by the suppression of chantries, gilds and holy days; even the few sheep of the poor brethren of a guild were seized to swell a sum which from 1550 was largely diverted from public purposes to private gain. Churches were despoiled of their plate; the old bishops were forced, the new more easily persuaded, to give up lands belonging to their sees, and rich men grew richer by robbing God.

When Mary succeeded her brother, the deprived bishops were restored, some reforming bishops were imprisoned, and Cranmer, who was implicated in the plot on behalf of Lady Jane Grey, was attainted of treason. As regards doctrine, religious practices and papal supremacy, Mary was set on bringing back her realm to the position existing before her father's quarrel with Rome. Her first parliament repealed the ecclesiastical legislation of Edward's reign, and convocation formally accepted transubstantiation. Seven bishops were deprived in 1554, four of them as married, and about a fifth of the beneficed clergy, though some received other benefits after putting away their wives. Apparently Mary at first believed that her authority would be accepted in religious matters; but one man with opposition, partly provocative, for Wyl's rebellious conduct, a monastic life, which was closely connected with religion, and more largely passive in the noble resolution of those who chose martyrdom rather than denial of their faith. To the nation at large, though not averse from the old doctrines and practices of the church, a return to the Roman obedience was distasteful. Nevertheless, Cardinal Pole was received as legate, and the title of Supreme Head of the Church having been dropped, a parliament carefully packed, and the fears of the rich appeased by the assurance that they would not have to surrender the monastic lands, he absolved the nation in parliament and reunit ed it to the Church of Rome on November 30, 1554, the clergy being absolved in convocation. Parliament repealed all acts against the Roman see since the twentieth year of Henry VIII. The heresy laws were revived, and a horrible persecution of those who refused to disown the doctrines of the prayer-book began in 1555, and lasted during the remainder of the reign. Nearly 300 persons were burned to death as heretics in these four years, among them being five bishops: Hooper of Gloucester, Ferrar of St. David's, Ridley of London, Latimer of Worcester, and Studdard of St. Albans, 1555, and Archbishop Cranmer in 1556. The chief responsibility for these horrors rests with the queen; the bishop who examined the accused were less zealous than she desired. The most prominent among them in persecution was Bonner of London. The exiles for religion were received at Frankfurt, Strassburg and Zürich. At Frankfurt a party among them objected to the ceremonies retained in the prayer-book, and, encouraged by Calvin and by Knox, who came to them from Geneva, quarreled with those who desired to keep the book unchanged. Mary died in 1558. Her reign arrested the rapid spoliation of the church and possibly prevented the adoption of doctrines which would have destroyed its apostolic character; the persecution by which it was disgraced strengthened the hold of the reformed religion on the people and made another acceptance of Roman supremacy for ever impossible.

Elizabeth's accession was hailed with pleasure; she was known to dislike her sister's ecclesiastical policy, and a change was expected. An Act of Supremacy restored to the crown the authority over the church held by Henry VIII., and provided for its exercise by commissioners, whence came the court of High Commission nominated by the crown, a high ecclesiastical court; but Elizabeth rejected the title of Supreme Head, and used that of Supreme Governor, as “over all persons and in all cases within her dominions supreme.” An Act of Uniformity prescribed the use of the prayer-book of 1552 in a revised form which raised the level of its doctrine, and injunctions enforced by a royal visitation re-established the reformed order. All the Marian bishops save two refused the oath of supremacy and were deprived and eight were imprisoned. Of the clergy generally few refused
it; for only some 200 were deprived for religion during the first six years of the reign. Bishops for the vacant sees were nominated by the crown and elected by their chaplains. Among these was Matthew Parker, canonically consecrated archbishop of Canterbury. The orthodoxy of the church was vindicated by Bishop Jewel’s Apologia ecclesiae Anglicanae. Adherents to Rome were vainly tried to obtain papal sanction for attending the church services, and were forced either to disobey the pope or become “recusants”; many were fined, and those who attended mass were imprisoned. Meanwhile a party, soon known as Puritans, rebelled against church order; the exiles who had come under Genevan influence objecting on their return to vestments and ceremonies enjoined by the prayer-book. There was much non-conformity in the church which the queen ordered the bishops to correct. Parker, though averse to violent measures, insisted on obedience to his “Advertisements” of 1566, which, though not formally authorized by the queen, expressed her will, and became held as authoritative, and some of the refractory were punished. A company engaged in irregular worship was discovered in London in 1567 and a few persons were imprisoned by the magistrate. Active opposition to the government was stirred up by Pius V., and in 1569 a rebellion in the north, where the old religion was strong, was aided by papal money and encouraged by hopes of Spanish intervention. In 1570 Pius published a bull excommunicating and deposing the queen. Thenceforward recusants had to choose between loyalty to the queen and loyalty to the pope. They lay under suspicion, and severe penal laws were enacted against Romish practices. About 1579 many seminary priests and Jesuits came over to England as missionaries; some actively engaged in treason, all were legally traitors. The country was threatened with foreign invasion, plots against the government were detected, and the queen’s life was held to be endangered. The council hunted down these priests and their abettors, and many were executed, martyrs to the doctrine of the pope’s power of deposition. The number put to death in this reign under the penal laws was 187. The papal policy defeated itself; a large number of the old religion while retaining their faith chose to be loyal to the queen, rather than lend themselves to the designs of her enemies. From 1571 recusants can no longer be reckoned as nonconforming members of the English Church: the law recognized them as separate from it. The church’s doctrine was defined in the catechism of 1570, and in the revised articles of religion which appeared as the XXXIX. Articles in 1571, and its law by a body of canons published with authority in 1576, the attempt at codification made in the Reformatio legum having been laid aside.

From 1574 the Protestant Nonconformists strove to introduce Presbyterianism. Cause for grievance existed in the state of the church which had suffered from the late violent changes. Elizabeth plundered it, and laymen who owned the rectories formerly held by monasteries followed her example; bishoprics were impoverished by the queen and parish cures by her subjects, and the reform of abuses was checked by self-interest. As bishops, along with some able men, Elizabeth chose other of the clergy of her order to sit in the plunder of their sees and whom she could use to report on recusants and barry nonconformists. Separation, or Independency, began about 1578 with the followers of Robert Browne, who repudiated the queen’s ecclesiastical authority; two Brownists were executed in 1583. The nonconformists remained in the church and continued their efforts to subvert its episcopal system. Elizabeth, though personally little influenced by religion, understood the political value of the church, and would allow no slackness in enforcing conformity. Archbishop Grindal was sequestered for defending “prophesysings,” or meetings of the Puritan clergy for religious exercises. The House of Commons, in which there was a Puritan element, repeatedly attempted to discuss church questions and was sharply silenced by the queen, who would not allow any interference in ecclesiastical matters. Whitgift, who succeeded Grindal in 1583, though kind-hearted, was strict in his administration of the law. Violent attacks were made upon the bishops in the Martin Marprelate tracts printed by a secret press; their author is unknown, and some who were probably connected with them were executed for publishing seditious libels. Whitgift’s firmness met with success. During the last years of the reign the movement towards Presbyterianism was checked and nonconformity was less prominent. The church regained a measure of orderliness and vigour; its claims on allegiance were advocated by eminent divines and expounded in the stately pages of Hooker. The queen, who had so vigorously ordered ecclesiastical affairs, died in 1603.

On the accession of James I. the Puritans expressed their desire for ecclesiastical change in the Millenary Petition which purported to come from 1000 clergy; their requests were moderate, a sign of the success of Whitgift’s policy, but some could not have been granted without causing widespread dissatisfaction. At a conference between divines of the two parties at Hampton Court in 1604, James roughly decided against the Puritans. Some small alterations were made in the prayer-book, and a new version of the Bible was undertaken, which appeared in 1611 as the “authorized version.” In 1604 convocation framed a code of canons which received royal authorization. Refusal to obey them was punished with deprivation, and, according to S. R. Gardiner, about 300 clergy were deprived, though a 17th century writer (Peter Heylyn) puts the number at 49 only, which W. H. Frere (History of the English Church, 1538-1605, p. 321) thinks more credible. Conformity could still be enforced, but before long the Puritan party grew in strength partly from religious and partly from political causes. They would not admit any authority in religion that was not based on the scriptures; their opponents maintained that the church had authority to ordain ceremonies not contrary to the scriptures. In doctrine the Puritans remained faithful to the Calvinism in which most Englishmen of the day had been brought up; they called the high churchmen Arminians, and asserted that they were inclined to Rome. The Commons became increasingly Puritan; they were strongly Protestant and demanded the enforcement of the laws against recusants, who suffered much, specially after the Gunpowder Plot of 1605, though they were sometimes shielded by the king. The Commons regarded ecclesiastical jurisdiction with dislike, specially the Court of High Commission, which had developed from the ecclesiastical commissions of Elizabeth and was hated as a means of coercion based on prerogative. The bishops derived their support from the king, and the church in return supported the king’s claim to absolutism and divine right. It suffered heavily from this alliance. As men saw the church on the side of absolutism, Puritanism grew strong both among the country gentry, who were largely represented in the Commons, and among the nation at large, and the church lost ground through the king’s political errors. A restoration of order and decency in worship and the introduction of more ceremonial began in James’s reign were carried on by Laud (q.v.) under Charles I. Laud aimed at silencing disputes about doctrine and enforcing the word unduly; he was a reveal of what political and religious advancement was desired to make every one accept their doctrines. Many of the reforms introduced by Laud after he became archbishop in 1633 were needful, but they offended the Puritans and were enforced in a harsh and tyrannical manner, for he lacked wisdom and sympathy. Under his rule nonconforming clergy were deprived and sometimes imprisoned. The cruel punishments inflicted by the Court of Star Chamber of which he was a member, the unpopularity of the High Commission Court, his own harsh dealing, and the part which he took in politics as a confidential adviser of the king, combined to bring odium upon him and upon the ecclesiastical system which he represented. The church was weak, for the Laudian system was disliked by the nation. A storm of discontent with the course of affairs both in church and state gathered. In 1640 Charles, after dissolving parliament, prolonged the session of convocation, which issued canons magnifying the royal authority and imposing the so-called “oath of allegiance” against innovations on all clergy, graduates.
and others. The Long Parliament voted the canons illegal; Laud was imprisoned, and in 1642 the bishops were excluded from parliament. The civil war began in 1642; in 1643 a bill was passed for the taking away of episcopacy, in 1645 Laud was beheaded, and parliament abolished the prayer-book and accepted the Presbyterian directory, and from 1646 Presbyterianism was the legal form of church government. Many, perhaps 10,000, clergy were deprived; some were imprisoned and otherwise maltreated, though a fifth of their former revenues was assigned to the dispossessed. The king, who was beheaded in 1649, might have extricated himself from his difficulties if he had consented to the overthrow of episcopacy, and may therefore be held a martyr to the church's cause. The victory of the army over the parliament secured England against the tyranny of Presbyterianism, but did not better the condition of the episcopal clergy; the toleration insisted on by the Independents did not extend to "prelacy." Churchmen, however, occasionally enjoyed the ministrations of their own clergy in private houses, and though their worship was sometimes disturbed they were not seriously persecuted for engaging in it. Non-delinquent or non-sequestrated private patronage and the obligation of tithes were retained.

Community of suffering and the execution of Charles I. brought the royalist country gentry into sympathy with the clergy, and at the Restoration was provided for by the Epsicopacy Act, which it lacked under the Laudian rule.

On the king's restoration the survivors of the ejected clergy quietly regained their benefits. The Presbyterian helped to bring back the king and looked for a reward. Charles II. promised them a limited episcopacy and other concessions, but his plan was rejected by the Commons.

A conference at the Savoy between leading Presbyterians and churchmen in 1661 was ineffectual, and a revision of the prayer-book by convocation further discontented non-conformists. The parliament of 1661 was violently anti-Puritan, and in 1662 passed an Act of Uniformity providing that all ministers not episcopally ordained or refusing to conform should be deprived on St. Bartholomew's day, the 14th of August following. About 2000 ministers are said to have been ejected, and in 1665 ejected ministers were forbidden to come within five miles of their former cures. Though some bishops and clergy showed kindness to the ejected, churchmen generally approved of this oppressive legislation; they could not forget the wrongs inflicted on their church by the once triumphant Puritans. Non-conformity was continued both in fine and on the third offence by transportation. In 1672 Charles, who had secretly promised the French king openly to profess Roman Catholicism, issued a Declaration of Indulgence which applied both to Romanists and Protestant Nonconformists, but parliament compelled him to withdraw it, and, in 1673, passed a Test Act making reception of the holy communion and a denial of transubstantiation necessary qualifications for public office. Later, when the dissenters found friends among the party in parliament opposed to the crown, the church supported the king, and the doctrine of passive obedience was generally accepted by the clergy. The church was popular, and among the great preachers and theologians who adored it in the Caroline period were Jeremy Taylor, Pearson, Bull, Barrow, South and Stillington. The lower clergy were mostly poor, and their social position was consequently often humble, but the pictures of clerical humiliation after 1660 are generally overcoloured; the assertion that they commonly married servants or cast-off mistresses of their patrons has been disproved, and it is certain that men of good family entertained and was state. The establishment between Archbishop Sheldon and Lord Chancellor Clarendon, the clergy ceased to tax themselves in convocation, and from 1665 they have been taxed by parliament. James II., though a Romanist, promised to protect the church, and the clergy were on his side in the rebellion of the duke of Monmouth, who was supported by dissenters. The church and the nation, however, were strongly Protestant and were soon alarmed by his efforts to Romanize England. He dispensed with the law by prerogative and appointed Romanists to offices in defiance of the Test Act. In 1688 he ordered that his declaration for liberty of conscience, issued in the interest of Romanism, should be read in all English churches. His order was almost universally disobeyed. Archbishops Sancroft and six bishops who resented against it were brought to trial, and were acquitted to the extreme delight of the nation. James's attack on the church cost him his crown.

Sancroft and eight bishops would not believe their belief in the doctrines of divine right and passive obedience by swearing allegiance to William and Mary, and the archbishop, five bishops and over 400 clergy were deprived. Certain of these nonjuring bishops consecrated others and a schism ensued. The loss to the church was heavy; for among the nonjurors were many men of holy lives and eminent learning, and the fact that some suffered for conscience' sake seemed a reproach on the rest of the clergy. After 1715 the secession became unimportant. Protestantism was secured from further royal attack by the Bill of Rights; and in 1701 the Act of Succession provided that all future sovereigns should be members of the Church of England. That the king's title rested on a parliamentary decision was destructive of the clerical theory of divine right, and encouraged Erastianism, then specially dangerous to the church; for William, a Dutch prince, established an episcopal church in which he himself was the supreme head. A strong movement was afoot for more desirous of union with other Protestant bodies than jealous for the principles of their own church. A bill for union was rejected in the Commons, where the church party had a majority, though one for toleration of Protestant dissenters became law.

William, anxious for concessions to dissenters, appointed a committee of convocation for altering the liturgy, canons and ecclesiastical courts, but the Tory party in the lower house of convocation was strong and the scheme was abortive. A long controversy began between the two houses: the bishops were mostly Whigs with latitudinarian tendencies, the lower clergy Tories and high churchmen. During most of the reign convocation was suspended and the church was governed by royal injunctions, a system injurious to its welfare. It had been the bulwark of the nation against Romanism under James II., and the affection of the nation enabled it to preserve its distinctive character amid dangers of an opposite kind under William III. Its religious life was active; associations for worship and the reformation of manners led to more frequent services, the establishment of schools for poor children, and the foundation of the Church Missionary Society (S.M.S.) in 1793, and for the Propagation of the Gospel in Foreign Parts (S.P.G.). This activity and the discord between the two houses of convocation continued during Anne's reign. Anne was a strong churchwoman, and under her the church reached its highest point of popularity and influence. Its supposed interests were used by the Tories for political ends. Hence the Occasional Conformity Act, to prevent evasion of the Test Act, and a tyrannical Schism Act, both repealed in 1718, belong rather to the history of parties than to that of the church. So, too, does the case of Dr. Sacheverell, who was prosecuted for a violently Tory sermon. His trial, in 1710, caused much excitement; mobs shouted for "High Church and Dr. Sacheverell," and the lightness of his sentence was hailed as a Tory victory. Queen Anne is gratefully remembered by the church for her "Bounty," which gave it the first-fruits and tenths (see ANNALES and QUEEN ANNE'S BOUNTY).

With the accession of the Hanoverian line the church entered on a period of feeble life and inaction: many church fabrics were neglected or discontinued; holy days were disregarded; Holy Communion was rare and infrequent; the poor were little cared for; and though the church remained popular, the clergy were lazy and held in contempt. In accepting the settlement of the crown the clergy generally sacrificed conviction to expediency, and their character suffered. Promotion largely depended on a profession of Whig principles: the church was regarded as subservient to the state; its historic position and claims were ignored, and it was treated by politicians as though its principal function was to
support the government. This change was accelerated by the silencing of convocation. A sermon by Hoadly, bishop of Bangor, impugned the existence of a visible church, and the "Bangorian controversy" which ensued threatened to end in the condem-
nation of his opinions by convocation, or at least by the lower house. As this would have weakened the government, convoca-
tion was prorogued, letters of business were withheld, and from 1717 until 1832 convocation, the church's constitutional organ of
reform, existed only in name. Walpole during his long
ministry, from 1721 to 1742, discouraged activity in the church lest it should become troublesome to his government. Prefer-
ment was shamelessly sought after even by pious men, and was begged and bestowed on the ground of political services. In
this the clergy, apart from the sacredness of clerical office, were neither better nor worse than the laity; in morality and decency they
were better even at the lowest point of their decline, about the middle of the century. While the church was inactive in practical
work, it showed vigour in the intellectual defence of Christianity. Controversies of earlier origin with assailants of the faith were ably
maintained by, among others, Daniel Waterland, William Law, a nonjuror, Bishop Butler, whose Analogy appeared in 1736, and Bishop
Berkeley. A revival of spirituality and energy at last set in. Its origin has been traced to Law's Sermons, published in 1738. Law's teaching was
actively seconded by John Wesley (q.v.), a clergyman from
1730 devoted himself to evangelization. Though his preaching
awoke much religious feeling, specially among the lower classes,
the excitement which attended it led to a horror of religious
enthusiasm, and his methods irritated the parochial clergy.
Some of them seconded his efforts, but far more regarded them
with violent and often unworthily expressed dislike. While he
urged his followers to adhere to the church, he could not himself
work in subordination to discipline; the Methodist organization
which he founded was independent of the church's system and
soon drifted into separation. Nevertheless, he did much to bring
about a revival of life in the church. Several clergymen became
his allies, and some preached in Lady Huntingdon's chapels
before her succession. These were among the fathers of the
Evangelical party: they differed from the Methodists in not
forming an organization, remaining in the church, working on
the parochial system, and generally holding Calvinistic doctrine,
being so far nearer to Whitfield than to Wesley, though Calvinism
gradually ceased to be a mark of the party. The Evangelicals
soon grew in number, and their influence for good was extensive.
They laid stress on the depravity of human nature, and on the
importance of conscious conversion as the necessary condition
of salvation rather than of incorporation with, and abiding in, the church of the redeemed. Prominent among
their early leaders after they became distinct from the Methodists
were William Romaine, Henry Venn and John Newton.
Bishop Porteus of London sympathized with them, Lord Dart-
mouth was a liberal patron, and Cowper's poetry spread their
doctrine in quarters where sermons might have failed to attract.
Religion was also forwarded in the church by the example of
George III. During his reign the progress of toleration, though
slow and fitful, greatly advanced both as regards Roman Catholics and Protestant dissenters. The spirit of rationalism, which
had been manifested earlier in attacks on revelation, appeared
in a movement against subscription to the Articles demanded
of the clergy and others which was defeated in parliament in
1772. The alarm consequent on the French Revolution checked
the progress of toleration and was temporarily fatal to free-
thinking; it strengthened the position of the church, which
was regarded as a bulwark of society against the spread of
revolutionary doctrines; and this caused the Evangelicals to
draw off more completely from the Methodists. The church was active: the Sunday-schoo1 movement, begun in 1755; the
foundation of the crusade against the slave-trade was vigorously
supported by Evangelicals; and the Church Missionary Society
(C.M.S.), a distinctly Evangelical organization, was founded.
Excellent as were the results of the revival generally, the
Evangelicals had defects which tended to weaken the church.

Some characteristics of their teaching were repellent to the
young; they were deficient in theological learning, and often
in learning of any kind; they took a low view of the church,
regarding it as the offspring of the Protestant reformation;
they expounded the Bible without reference to the church's
teaching, and paid little heed to the church's directions. Dissent
consequently grew stronger. By the Act of Union with Ireland
the Churches of England and Ireland were united from the
1st of January 1801, and thecontinuance of the united church
was declared an essential part of the union. No provision,
however, was made giving the Irish clergy a place in convocation,
which was evidently held unlikely to revive. The union of
the churches was dissolved in 1871 by an act of 1869 for disestablishing the Irish Church.

Apart from the Evangelical revival, religion was advanced
in the church. In 1811 the education of the poor was provided
for on church principles by the National Society; the
Church Building Society was founded in 1818; and the
colonial episcopate was started by the establishment
of bishoprics in Calcutta in 1814, and in Jamaica and Barbados in
1824. Yet reforms were urgently needed. In 1813, out of about
10,800 benefices, 6311 are said to have been without resident
incumbents (The Black Book, p. 34); the value of some great offices
was enormous, while many of the parochial clergy were wretchedly
poor. The result of the Test Act, long practically inoperative,
in 1828, and Catholic emancipation in 1829, mark a change in
the relations of church and state; and the Reform Bill of 1832
transferred political power from a class which generally supported
the church to classes in which dissent was strong. The
national zeal for reform was directed towards the church, not always
in a friendly spirit. Yet wholesome changes were effected by
legislation: dioceses were rearranged and two new bishoprics
founded at Manchester and Ripon, the bishopric of Bristol,
however, being suppressed; plurality and non-residence were
abolished; tithes were commuted, and the Ecclesiastical Com-
mision, which has effected reforms in respect of endowments,
was permanently established in 1836. Some changes and
proposals alarmed churchmen, specially as legislation for the church
proceeded from parliament, while convocation remained silenced.
Latitudinarian opinions revived, and the church was regarded
merely as a human institution. Among the clergy generally
ritual observance was neglected and rubrical directions disobeyed.
A few churchmen, including Keble and Newman, set themselves
to revive church feeling, and Oxford became the centre of a new
movement. The publication of Keble's Christiain Year prepared
the way, and its aims were declared in his assize sermon at Oxford
on "National Apostacy" in 1832. Its promoters urged their
views in Tracts for the Times, and were strengthened by the
adhesion of Pusey. Hence they were nicknamed Tractarians
or Puseyites. Their cardinal doctrine was that the Church of
England was a part of the visible Holy Catholic Church and had
unbroken connexion with the primitive church; they inculcated
high views of the sacraments, and emphasized points of agree-
ment with those branches of the Catholic Church which claim
apostolic succession. Their party grew in spite of the opposition
of low and broad churchmen, who, specially on the publication
of Tract XC. by Newman in 1841, declared that its teaching
was Romanizing. In 1845 Newman and several others seceded
to Rome. Newman's apostasy was a severe blow to the church,
though permanent injury was averted by the steadfastness of
Pusey. The Oxford movement was wrecked, but its effect
survived both in the new high church party and in the church
at large. As a body the clergy rated more highly the responsi-
bilities and dignity of their profession, and became more zealous
in the performance of its duties and more ecclesiastically minded.
High churchmen carried out rubrical directions, and after a while
began to introduce changes into the performance of divine
service which had not been adopted by the early leaders of the
party, were deprecated by many bishops, and excited opposition.

In 1833 the supreme jurisdiction of the Court of Delegates
was transferred to the judicial committee of the privy council.
Before this court came an appeal by a clerk named Gorham.
ENGLAND, CHURCH OF

The church and the law courts.

The statement of a new judge in place of the old ecclesiastical judges, the officials principal, of the two provinces. Litigation increased, the only check on prosecutions being the right of the bishop to veto proceedings, and in 1876–1881 four clergy were imprisoned for disobedience to the orders of courts against whose jurisdiction they protested. In consequence of the scandal raised by this mode of dealing with spiritual causes, a royal commission on ecclesiastical courts was appointed in 1881, but its report in 1883 led to no results, and the bishops strove to mend matters by exercising their veto. Advanced and illegal usages became more frequent. Proceedings in respect of illegal ritual having been instituted against Bishop King of Lincoln, the archbishop of Canterbury (Benson) personally heard and decided the case in 1890, and his judgment was upheld by the judicial committee (see LINCOLN JUDGMENT). The spiritual character of the tribunal and the authority of the judgement which sanctioned certain usages and condemned others, had a quieting effect. Increase in ritualism, however, caused agitation in 1898, and in 1899 and 1900 the two archbishops, Temple of Canterbury and Maclagan of York, delivered “opinions” condemning the use of incense and processionals, and the reservation of the consecrated elements. Finding himself unable to put down illegal practices, Bishop Creighton of London adopted a policy of compromise which was followed by other bishops, and encouraged illegality. Disregard of law both in excess and defect of ritual being common, a royal commission on ecclesiastical discipline was appointed in 1904. The commissioners presented a unanimous report in 1906, in which their chief recommendations were, briefly, that practices significant of doctrines repugnant to those of the English Church should be extirpated; that the convocations should prepare a new ornamens rubric, and frame modifications in the conduct of divine service; that the diocesan and provincial courts and the court of final appeal should be reformed in accordance with the recommendations of 1883, the last to consist of a permanent body of lay judges who on all doubtful questions touching the doctrine or use of the church should be bound by the decision of an episcopal assembly; that the Public Worship Regulation Act should be repealed, and the bishops’ power of veto abolished.

Since the Oxford movement the church has developed wonderful energy. Yet it is beset with difficulties and dangers both from within and without. Within, besides difficulties as regards ritual, it has to contend against rationalism, which has been intensified by scientific discoveries and speculations, and far more by Biblical criticism. While this criticism has been used by many as a means to a fuller comprehension of divine revelation, much of it is simply destructive, and has led to ill-considered expressions of opinion adverse to the doctrine of the church. From without, the church has been threatened with disestablishment both wholly and as regards the dioceses within the Welsh counties; and the education of the poor, which from early days depended on its funds, has largely been taken out of its hands (see EDUCATION). The amount contributed by the church to elementary education, including the maintenance of Sunday schools, in 1907–8 was £576,012. During the last sixty years the church has strengthened its hold on the loyalty of the nation by its increased efficiency. Its bishops are laborious and active. Since 1876 the home episcopal has been increased by the creation of the dioceses of Truro, St Albans, Lincoln, Norwich, Wakefield, Wrexham, Bristol, Southwark, and Birmingham, so that there are now thirty-seven diocesan bishops, aided by twenty-eight suffragan and eighty assistant bishops, and a further subdivision of dioceses is contemplated. At no other time probably have the clergy been so industrious. As a rule they are far better instructed in theology than forty years ago, but they have not advanced in secular learning. Changes in the university system have contributed to draw off able young men to other professions which offer greater worldly advantages. The poverty of the clergy stands in strong contrast to the wealth around them. Of 14,242 benefices 4704 are said to be below £200 a year net value. The value of £100 tithe rent charge has sunk (1900) to £69,18; t. the average value since the Commutation Act of 1836 being 494. The number of assistant clergy is (1910) about 7500, in spite of the hardships often attending clerical life, the supply of men being kept up. The Queen Victoria Clergy Fund and other voluntary associations and various educational institutions have been founded to relieve clerical distress. In the church there is much energy in numberless directions; cathedral
churches have become centres of religious activity, and in parish churches the administration of the Holy Communion and week-day services are frequent. Many of the laity co-operate in church work and liberally support it. During the years 1898–1907 598 churches were built or rebuilt, and during twenty-four years, 1884–1907, the voluntary offerings for church building were £2,761,700, and for endowments and parsonages £611,592, yet church extension fails to keep pace with the increase of the population. Evangelistic efforts, the relief of the sick and poor, and the inculcation of temperance are zealously carried on. Good work is done by twenty-six sisterhoods and several institutions of deaconesses, and one or two communities of celibate clergy. In the British colonies and India the episcopate consists (1909) of seven archbishops with two coadjutors; there are also seventy diocesan bishops, and in other parts of the world thirty missionary bishops. The S.P.G. has 847 ordained ministers, including thirty chaplains in Europe, besides many female missionaries; the C.M.S. has 793 ordained ministers, and many other missionaries of both sexes; the Zenana Missionary Society has a staff of 128; other church societies for foreign missions are more numerous, and the S.P.C.K. in addition to its work at home spends large sums in furthering the church abroad. The benefits arising from conference have increasingly been valued since the revival of the Anglican Church. Appreciation of the importance of lay support and counsel has led to the institution of two voluntary elective assemblies called Houses of Laymen, one for each province, and in 1903 an association of the four houses of conference and the two lay assemblies was formed with the name of the Representative Church Council. During the last forty years diocesan conferences, in which the laity are represented, have become universal, while rural dean and other meetings of a like kind are now annual. An annual church congress, established in 1861, held its forty-ninth meeting in 1909. Of wider importance are the Lambeth conferences, held since 1866 at intervals of ten years, to which the bishops of the English Church and the churches in communion with it are invited, and meet under the presidency of the archbishop of Canterbury. The first of these conferences, which illustrated the dignity of the English church from St Augustine and now the head of a vast quasi-patriarchate, was held under the presidency of Archbishop Longley in 1867 (see Lambeth Conferences and Anglican Communion).

ENGLEFIELD, SIR FRANCIS (c. 1520–1596), English High-Church Catholic politician, born probably about 1520, was the eldest son of Sir Thomas Englefield of Englefield, Berkshire, justice of the common pleas. His mother was Elizabeth, daughter of Sir Robert Throckmorton, one of the well-known Catholic family of Couplon, Warwickshire. Francis, who succeeded his father in 1537, was too young to have taken any part in the opposition to the abolition of the Roman jurisdiction and dissolution of the monasteries; and he acquiesced in these measures to the extent of taking the oath of royal supremacy, serving as sheriff of Berkshire and Oxfordshire in 1546–1547, and accepting in 1545 a grant of the manor of Tilehurst, which had belonged to Reading Abbey. He was even knighted at the coronation of Edward VI. in February 1547. But the progress of the Reformation during that reign alienated him, and he attached his fortunes to the cause of the princess Mary, whose service he entered before 1553. In August of that year he was sent to the Tower for consulting Masses to be celebrated in Mary's household. He was released in the following March, and permitted to resume his duties in Mary's service. But in February 1553 he was again summoned before the privy council, and may have been in confinement at the crisis of July; perhaps he was only released on Mary's triumph, for his name does not appear among those who exerted themselves on her behalf before the middle of August. He was then sworn a member of the privy council like many others who owed their promotion to their loyalty rather than to their political abilities. Their numbers swelled the privy council and sadly impaired its efficiency; but Mary resisted the various attempts to get rid of them because she liked staunch friends, and regarded them as a salutary check upon the able but less scrupulous members who had served Edward VI. as well as herself. Englefield sat as M.P. for Berkshire in all Mary's parliaments except that of April 1554, but received no higher political office than the lucrative mastership of the court of wards.

He was an ardent believer in persecution, was present at Hooper's trial, sought Ascham's ruin, and naturally lost his office and his seat on the privy council at Elizabeth's succession. He retired to the continent before May 1559, and from that time until his death was an active participant in all schemes for the restoration of Roman Catholicism. At first his ideas took such comparatively mild forms as inducing the pope to send a legate to persuade Elizabeth to return to the fold; but gradually they grew more violent and treasonable, until Englefield became the close confidant of Cardinal Allen, Parsons and the "jesuited" Catholics, who advocated forcible intervention by Spain and the succession of the infants; in 1585 Englefield thought that Mary's succession, peaceful or other, would not be satisfactory unless it were owing to Spanish support and she were dependent on Philip. Englefield lived first at Rome, then in the Low Countries, and finally at Valladolid. He was blind for the last twenty years of his life, and received a pension of six hundred crowns from Philip. He had been outlawed in 1564 and his estates sequestered, but these were not recovered until 1585, when an act of attainder was passed against Englefield. Even then the Englefields stood in the way of their appropriation by the crown, for Englefield, obviously with an eye to this contingency, had conditionally settled them on his nephew Francis. The long arguments on the point are given in Coke's Reports, and a further act was passed in 1592 confirming the forfeiture to the crown. The nephew, however, eventually recovered some of the family estates, and was created a baronet in 1612. His uncle was alive in September 1596, but apparently died at Valladolid about the end of that year. His tomb there used to be shown to visitors as that of an eminent man.
ENGLERHEART—ENGLISH CHANNEL

See Dict. of Nat. Biol., xvii. 372-374; but additional light has been thrown on Englefield's career since the date of that article by the publication of the Spanish and Venetian Calendars, the Hatfield MSS., the Acts of the Privy Council, and the Letters and Papers of Henry VIII.

ENGLEHEART, GEORGE (1752–1829), English miniature painter, the great rival of Richard Cosway, was born at Kew in October 1752, and received his artistic training first under George Barret, R.A., and then under Sir Joshua Reynolds. He started on his own account in 1773, and exhibited in that year at the Royal Academy. He continued the active pursuit of his profession down to 1813, when he retired, and his fee-book, still in existence, records the names of his sitters, and the amount paid for each portrait, proving that he painted 4853 miniatures during that period of thirty-nine years, and that his professional income for many years exceeded £1200 a year. During the greater part of his life he resided in Hertford Street, Mayfair, where he lived till he retired. He died at Blackheath in 1829, and was buried at Kew.

He painted George III. twenty-five times, and had a very extensive circle of patrons, comprising nearly all the important persons connected with the court. He made careful copies in miniature of many of the famous paintings executed by Sir Joshua Reynolds, and in some cases these constitute the only information we possess respecting portraits by Sir Joshua that are now missing. His fee-book, colours, appliances and a large collection of his miniatures still remain in the possession of his descendants.

His nephew, John Cox Dillman Engleheart (1784–1862), also a miniature painter, entered George Engleheart's studio when he was but fourteen years of age. He first exhibited at the Royal Academy in 1801, and sent in altogether 157 works. He was a man of substantial means, and, in his time a very popular painter, but his health broke down when he was forty-four years old, and he had to relinquish the pursuit of his profession. He lived at Tunbridge Wells for some years and died there in 1862.

See George Engleheart, by G. C. Williamson and H. L. D. Engleheart (1902).

ENGLEWOOD, a city of Bergen county, New Jersey, U.S.A., near the Hudson river, 14 m. N. by E. of Jersey City. Pop. (1900) 6253, of whom 1548 were foreign-born and 386 negroes (1905) 7922; (1910) 9024. It is served by a branch of the Erie railroad, and by an electric line connecting with a ferry (at Fort Lee) to New York. Englewood is primarily a residential suburb of New York. The site rises above terrace from the marshes in the valley of the Hackensack to the top of the palisades overlooking the Hudson, from which Englewood is separated by the borough of Englewood Cliffs (pop. in 1905, 266). There are several fine residences, a hospital, a public library and the Dwight school for girls (1850). The site of Englewood was for a long time a part of "Englewood Neighbourhood," and was known as Liberty Pole; but until 1859, when the place was laid out, there were only a few houses here, one of which was the "Liberty Pole Tavern." In 1871 Englewood was set off from the township of Hackensack and was incorporated as a separate township, and in 1866 it was chartered as a city; but the act under which it was chartered was declared unconstitutional, and in 1889 Englewood was rechartered as a city by a special act of the state legislature.

ENGLISH CHANNEL (commonly called "The Channel"; Fr. La Manche, "the sleeve"), the narrow sea separating England from France. If its entrance be taken to lie between Ushant and the Scilly Isles, its extreme breadth (between those points) is about 100 m., and its length about 350. At the Strait of Dover, its breadth decreases to 20 m. Along both coasts of the Channel, cliffs and lowland alternate, and the geological affinities between successive opposite stretches are well marked, as between the Devonian and granitic rocks of Cornwall and Brittany, the Jurassic of Portland and Calvados, and the Cretaceous of the Pays de Caux and the Isle of Wight and the Sussex coast, as well as either shore of the Strait of Dover. The English Channel is of comparatively recent geological formation. The land-con

extion between England and the continent was not finally severed until the latter part of the Pleistocene period. The Channel covers what was previously a wide valley, and may be described now as a headless gulf. The action of waves and currents, both destructive and constructive, is well seen at many points; thus Shakespeare Cliff at Dover is said to have been cut back more than a mile during the Christian era, and the cliffs of Grisnez have similarly receded. Of the opposite process notable examples are the building of the pebbly beaches of Chesil Bank and near Tréguier in Côtes du Nord, and the promontory of Dungeness. The total drainage area of the English rivers flowing into the Channel is about 8000 sq. m.; of the French rivers, including as they do the Seine, it is about 41,000 sq. m.

From the Strait of Dover the bottom slopes fairly regularly down to the western entrance of the Channel, the average depths ranging from 20 to 30 fathoms in the Strait to 60 fathoms at the entrance. An exception to this condition, however, is found in Hurd's Deep, a narrow depression about 70 m. long, lying north and north-west of the Channel Islands, and at its nearest point to them only 5 m. distant from their outlying rocks, the Casquets. Casquets Channel, its eastern end and Hurds Deep has an extreme depth of 94 fathoms, and in it are found steeper slopes from shool to deep water than elsewhere within the Channel. Nearing the entrance to the Channel from the Atlantic, the 100 fathoms line may be taken to mark the edge of soundings. Beyond this depth the bottom falls away rapidly. The 100 fathoms line is laid down about 180 m. W. to 120 m. S.W. of the Scilly Isles, and 80 m. W. of Ushant. Within it there are considerable irregularities of the bottom; thus a succession of narrow ridges running N.E. and S.W. occurs west of the Scillies, while only 4 m. N.W. of Ushant there is a small depression in which a depth of 195 fathoms has been found. As a general rule the slope from the English coast to the deepest parts of the Channel is more regular than that from the French coast, and for that reason, and in consideration of the greater dangers to navigation towards the French shore, the fairway is taken to lie between 12 and 24 m. from the principal promontories of the English shore, as far up-channel as Beachy Head. These promontories (the Lizard, Start Point, Portland Bill, St. Alban's Head, St. Catherine's Point of the Isle of Wight, Selsey Bill, Beachy Head, Dungeness, the Scilly Foreland) demarcate a series of bays roughly of sickle-shape, the shores of which run north and south, or nearly so, at their western sides, turn eastward somewhat abruptly at their heads, and then trend more gently towards the south-east. On the French coast the arrangement is similar but reversed; Capes Grisnez, Antifer and La Hague, and the Pointe du Sillon demarcate a series of bays (larger than those on the English coast) whose shores run north and south on the eastern side, and have a gentler trend westward from the head.

The configuration of the coasts is perhaps the chief cause of the peculiarities of tides in the Channel. From the entrance as far as Portland Bill the time of high water is found to be progressively later in passing from west to east, being influenced by the oceanic tidal stream from the west under conditions which are on the whole normal. But eastward of a line between Portland Bill and the Gulf of St Malo these conditions are changed and great irregularities are observed. On the English coast Portland and Selsey a double tide is found; but Portland this double tide corresponds approximately with the time of low water in the regular tidal progression, and the result is the occurrence of two periods of low water, separated by a slight rise known locally as "guilder." But farther east the double tide corresponds more nearly with the time of high water, and in consequence either the effect is produced of a prolonged period of high water, or there are actually two periods of high water, as at Southampton. Various causes apparently contribute to this phenomenon. The configuration of the coast line is such as to present intervals barriers to the regular movement of the tidal wave (west to east), so that reflex waves (east to west) are set up. In the extreme case at Southampton the tidal effect is carried from the outer Channel first by way of
ENGLISH CHANNEL

The Solent, the strait west of the Isle of Wight, and later by way of Spithead, the eastern strait. Finally the effect of the tidal stream entering the Channel through the Strait of Dover from the North Sea must be considered. The set of this stream towards the Strait of Dover from the east corresponds in time with that of the Channel stream (i.e. the stream within an area defined by Start Point, the Casquets, Beachy Head and the mouth of the Somme) towards the strait from the west; the set of the two streams away from the strait also corresponds, and consequently they alternately meet and separate. The area in which the meeting and separation take place lies between Beachy Head and the North Foreland, the mouth of the Somme and Dunkirk. Within this area, therefore, a stream is formed, known as the intermediate stream, which, running at first with the Channel stream and then with the North Sea stream, changes its direction throughout its length almost simultaneously, and is never slack. Under these conditions, the time of high water eastward of Selsey Bill as far as Dover is almost the same at all points, though somewhat earlier at the east than at the west of this stretch of coast. The configuration of the French coast causes a very strong tidal flow in the Gulf of St Malo and the grain of spring tides at 42 ft. at St. Germain, compared with a range of 12 ft. at Exmouth and 7 ft. at Portland. In the neighbourhood of Beer Head and Portland and Weymouth Roads the streams are found to form vortices with only a slight movement. On the eastern (Selsey-Dover) section of the English coast the maximum range of tide is found at Hastings, with a decrease both eastward and westward of this point.

Westerly winds are most prevalent in the Channel. The total number of gales recorded in the period 1871-1885 was 190, of which 104 were south-westerly. Gales are most frequent from October to January (November during the above period had more than any other month, with an average of 2·1), and most rare from May to July. It appears that gales are generally more violent and prolonged when coincident with spring tides than with neaps. The winds have naturally a powerful effect on the tidal streams and currents, the latter being in these seas simply movements of the water set up by gales, which may themselves be far distant. Thus under the influence of westerly winds prevailing west of the Iberian Peninsula a current may be set up from the Biscay to the Solent, across the entrance of the Channel; this is called Rennell’s current. Fogs and thick weather are common in the Channel, and occur at all seasons of the year. Observations during the period 1876-1890 at Dover, Hurst Castle and the Scilly Isles showed that at the two first stations fogs most frequently accompany anticyclonic conditions in winter, but at the Scilly Isles they are much more common in summer than in winter, and accompany winds of moderate strength more frequently than in the case of the up-Channel stations.

(O. J. R. H.)

Salinity and Temperature.—The waters of the English Channel are derived partly from the west and partly from the English and French rivers, and all observations tend to show that there is a slow and almost continuous current through it from west to east. The western supply comes from two sources, one of which, the more important, is the relatively salt and warm water of the Bay of Biscay, which enters from the south-west and has a salinity sometimes reaching 35.6 pro mille (parts of salt per thousand of water weight), the other consists of southerly current from the Irish Channel and colder water has a salinity of 35.0 to 35.2 pro mille. As the water passes eastward it mixes with the fresher coastal water, so that the salinities generally rise from the shore to the central line, and from east to west, though south of Scilly Islands there is often a fall due to the influence of the Irish Channel. The mean annual salinity decreases from between 35.4 and 35.5 pro mille in the western entrance to 35.2 pro mille at the Strait of Dover on the central axis, and to about 34.7 pro mille under the Isle of Wight and off the Bay of the Scine. The English Channel may be divided into two areas by a line drawn from Start Point to Guernsey and the Gulf of St Malo. In the eastern area the water is thoroughly mixed owing to the action of the strong tidal currents and its comparatively small depth, and salinities and temperatures are therefore generally the same from surface to bottom; while westward of this line there is often a strongly marked division into layers of different salinity and temperature, especially in summer and autumn, when the fresher water of the Irish Channel is found overlying the salt water of the Bay of Biscay. The salinity of the English Channel undergoes an annual change, being highest in winter and spring and lowest in summer, and this change is better marked in the eastern area, where the mean deviation from the annual mean reaches 0.3 pro mille, than it is farther west with a mean deviation of 0.1 pro mille. There is also reason to believe that there is a regular change with a two-year period, years of high maximum and low minimum alternating with years of low maximum and high minimum. Variations of long period or unperiodic also occur, which are probably, and in one case (1895) almost certainly, due to changes taking place some months earlier far out in the Atlantic Ocean.

The mean annual surface temperature increases from between 11° C. and 11.5° C. at the Strait of Dover to over 12° C. at the western entrance.1 The yearly range in the eastern area is considerable, reaching 12° C. off the Isle of Wight and 10° C. in the vicinity of the mouth of the Somme; it gradually decreases to 5° C. at a short distance north-west of Ushant. The mean temperature, over 16° C., is found under the English coast from Start Point to the Strait of Dover about the 1st of September and off the French coast eastward of Cape la Hague about eleven days later. In the western area the maximum temperature is about 15° C. and occurs between September 1 and 11. The mean minimum surface temperature is between 5° C. and 6° C. at the eastern end, and increases to over 9° C. off the coast of Brittany. Owing to the thorough mixing of the water in the eastern area the temperatures are here generally the same at all depths, and the description of the surface conditions applies equally to the bottom. In the western entrance, on the other hand, the bottom temperature is often much lower than on the surface; the range here is also much less, about 3° C., and the maximum is not reached till after the 1st of October, or from three weeks to a month later than on the surface.

A detailed account of the mean conditions in the English Channel will be found in Rap. et procès-verbaux, vol. VI., and Bulletin supplémentaire (1908) of the Conseil Permanent International pour l’Exploration de la Mer (Copenhagen).

(D. J. M.)

Cross-Channel Communication.—An immense amount of time and thought has been expended in the elaboration of schemes to provide unbroken railway communication between Great Britain and the continent of Europe and enable passengers and goods to be conveyed across the Channel without the delay and expense involved in transshipping them into and out of ordinary steamers. These schemes have taken three main forms: (1) tunnels, either made through the ground under the sea, or consisting of built-up structures resting upon the sea bed; (2) bridges, either elevated high above the sea-level so as to admit of the unimpeded passage of ships under them, or submerged below the surface; and (3) train ferries, or vessels capable of conveying a train of railway vehicles with their loads. A tunnel was first proposed at the very beginning of the 19th century by a French mining engineer named Mathieu, whose scheme was for a line favourably regarded by Napoleon, but it was first put on a practical basis more than fifty years later by J. A. Thomé de Gandon (1807-1876), whose plans were submitted to the French emperor in 1856. This engineer had begun to work at the problem of cross-Channel communication twenty years previously, and had considered the possibility of a submerged tunnel or tube resting on the sea-level, of steam ferries plying between huge piers thrown out from both coasts, and of a bridge, for which he prepared five different plans. He again brought forward his scheme for a tunnel, in a modified form, in 1867, and exhibited his plans in the Universal Exhibition of that year. About the same time an English engineer, William Lowe, of Wrexham, was also working at the idea of a tunnel. Geological investigation convinced him that between Farnholt, a point half a

1 50° F. = 10° C.; 60°-8° F. = 16° C.
miles west of the South Foreland light, and Sangatte on the French coast, 4 m. W. of Calais, the Dover grey chalk was continuous from side to side, and he considered that this stratum, owing to its comparative freedom from water and the general absence of cracks and fissures, offered exceptional advantages for a tunnel. He and Théomé de Gamond joined forces, and their plans were adopted by an international committee whose object was to popularize the idea of a tunnel both in England and France. Its engineers on the English side were Lowe, Sir James Brunlees and Sir John Hawkshaw, the last of whom in 1866 had made trial borings at St Margaret’s and near Sangatte; and on the French side Théomé de Gamond, Paulin Talabot and Michael Chevalier. In 1868 they reported that there was a reasonable prospect of completing the tunnel in ten or twelve years at a cost not exceeding ten millions sterling. They admitted, however, that there was some risk of an influx of the sea, but pointed out that this risk could be determined by driving preliminary driftways, as suggested by Lowe, and for this purpose asked for financial aid from the imperial treasury. A commission of inquiry then appointed by the French ministry of public works reported favourably on the plans, though it declined to recommend a grant of money; but the further progress of the scheme was interrupted by the outbreak of the Franco-German war.

The tunnel was by no means the only plan in evidence at this period for securing continuous railway communication between England and France. An iron tube, resting on the bottom of the sea, had been proposed by Tessier de Motray in 1803, and had again been considered by Théomé de Gamond in 1833; but after 1850 projects of this kind might almost be counted by the dozen. Some of the structures were to be of iron, others of concrete or masonry, and some were to be floated a moderate distance below the surface. One of the most carefully worked out plans was that of J. F. Bateman and J. Reyn, who proposed to construct a continuous tube, 2,3 ft. in internal diameter, of iron rings each 10 ft. long, each ring being built out from the completed portion of the tube by means of a horizontal chamber or bell, which slid telescopically over the last few rings previously put in place, and was moved forward by hydraulic power. About the same time Zerah Colburn produced plans for a tunnel constructed of two Z-shaped sections, which were to be built in sections and then successively attached by a ball and socket joint to the completed portion, the whole being raised from the bottom and dragged out to sea, by the aid of a large number of ships, as each section was attached and launched. Thomas Page, again, the builder of Westminster Bridge, proposed to place eight conical steel shafts at intervals across the Strait of Dover, and to connect them by long sections of tube lowered from the surface, the whole structure being covered with concrete when finished. No attempt was made to put any of these plans into execution, and the same was true of several bridge schemes propounded about the same time; in one of these, spans one-half or three-quarters of a mile in length were contemplated, while another required 100 towers, 300 ft. apart and rising 500 ft. above the water-level, which obviously would have constituted an intolerable nuisance to navigation. The case, however, was different with a train ferry which was vigorously advocated by Sir John Fowler. His proposal was to employ steamers 450 ft. long, with a beam of 57 ft. and a speed of 20 knots, having railway lines laid down on their decks, and so to stop trains running, the vehicles would be able to run directly at each side of the strait. Dover was to be the English port, while on the French coast a new harbour was to be formed at Audresselles, between Calais and Boulogne. This plan in 1872 received the sanction of the House of Commons, but was rejected in the House of Lords by the casting vote of the chairman of the committee. According to another similar ferry scheme, which was worked out by Admiral Dupuy de Lôme in 1870, a new maritime station was to be constructed at Calais, so far off the shore that it would command deep water at every state of the tide, and connected with the French railways by a bridge.

After the conclusion of the Franco-Prussian War, negotiations concerning the tunnel were resumed between the French and British governments, and in 1872 the latter intimated that it had “no objection in principle.” After some further communications between the two governments in 1874, settling the basis on which the scheme should be allowed to proceed, a joint commission was appointed to arrange details relating to jurisdiction, the right of blocking the tunnel, &c., and this commission’s report was accepted as a basis of agreement between the governments. In 1875 the Channel Tunnel Company obtained an act authorizing it to undertake certain preliminary works at St Margaret’s Bay. In the same year the French Submarine Railway Company obtained a concession, with the obligation to spend a minimum of 2,000,000 francs in making investigations; in fact it took over 3,000 samples from the bottom of the sea in the strait, and made over 7,000 soundings, and also sunk a shaft at Sangatte and started a heading. The English company did not do so much, for it failed to raise the money it required and its powers expired in 1880. Moreover, it was not the only company in the field, and its programme was not universally accepted as the best possible. Some authorities, such as Sir Joseph Frewsnot, doubted whether the tunnel should be attempted in the first place, because of the likelihood of fissures being encountered while others who thought the project had no doubt of it. Disputes arose about the actual plans and formed a rival “Anglo-French Submarine Railway Company.” In 1882 another tunnel company made its appearance. In 1874 the South Eastern Railway Company had obtained powers to sink experimental shafts on its property between Dover and Folkestone, and in 1881 to acquire lands, including the beach and foreshore, in that area in connexion with a Channel tunnel. These powers resulted, in 1882, in the formation of the Submarine Continental Railway Company which in that year sought Parliamentary sanction for a tunnel, starting from a point west of Dover, at Shakespeare’s Cliff; and at the same time the resuscitated Channel Tunnel Company applied for powers to make one from Fahanole, instead of St Margaret’s Bay as in its former scheme. The whole question of the tunnel was then widely discussed and considered by various committees, the last of which—a joint select committee of the Lords and Commons—in 1885 expressed the opinion by a majority that it was “inexpedient that Parliamentary sanction should be given to the plan of a tunnel under the Sea between England and France.” This decision for the time being left the question of making a tunnel, and though Sir Edward Watkin, one of its most prominent advocates, brought bill after bill beforehand to authorize experimental works in connexion with it, all were rejected. In 1882 the government interfered with the operations then in progress, and they were ultimately discontinued. They included a driftway 7 ft. in diameter which was driven for a distance of about 4,000 yards outwards under the sea at an inclination of 1 in 72 from the bottom of a shaft sunk to a depth of 164 ft. in the chalk marl at Shakespeare’s Cliff.

About this time the Channel Bridge and Railway Company took in hand the design of a bridge, the preliminary plans for which were exhibited in the Paris Exhibition of 1880. The terminal points were Folkestone and Cap Grisnez, and for the sake of facilitating the laying of the pier foundations it was proposed to take the bridge over the Varne and Colbatt shoals. The main girders were to be nearly 50 yds. above the sea-level, the railway itself being more than 20 ft. higher still, and the spans were to vary in length between 500 and 1,000 yds. As the result of a survey of the sea bottom made in 1890, a modification in the line of the bridge was adopted, and it was taken direct from Cap Blancnez to the South Foreland. It was found that in this way an excellent bottom would be obtained for the foundations, and the length of the bridge would be 3 m. less, the number of piers, by employing spans of 454 and 542 yds. alternately, being reduced to 72. The cost of this structure was estimated at £2,320,000, exclusive of interest on capital during the period of construction, which was put at seven years. The company also worked out plans for a moving chariot or platform, capable of holding a railway train and supported by long legs on a submerged causeway or track constructed of steel or
armoured concrete, 45 or 50 ft. below low-water level. No attempt has been made actually to carry out either this project or that of a bridge.

In 1905 the question of establishing a train ferry from Dover across the Channel was brought forward by the Intercontinental Railway Company, and in the following year the Channel Ferry (Dover) Act was passed authorizing the work. About the same period the Channel Tunnel Company, which had amalgamated with the Submarine Railway Company, awoke to activity and started a campaign in favour of its scheme; but the bill which it promoted was opposed by the government and accordingly was withdrawn in March 1907.

ENGLISH FINANCE. The history of the English fiscal system affords the best example known of continuous financial development, in respect both of institutions and methods. Though certain great periods of change can be readily noticed, yet from the time of the Norman Conquest to the beginning of the 20th century the line of connexion is substantially unbroken. Perhaps the most revolutionary changes occurred in the 17th century, as the outcome of the Civil War, and, later on, the revolution of 1688. But even in this case there was no real breach of continuity. It is, therefore, possible to trace the normal growth and expansion of British finance as one of the aspects of the nation's history.

The primitive financial institutions of England centre round the king's household, or, in other words, the royal economy preceded the national one. Revenue dues collected by the king's agents, rents, or rather returns of produce, from land, and special levies for emergencies form the elements of the royal income, which gradually acquired greater regularity and consistency. There is, however, little or no evidence of any effective financial organization apart from the royal income and its exercises from Normandy, which so powerfully affected the English rulers at this time, tending towards the creation of records of revenue claims and also of a central treasury.

With the union of England and Normandy under the same head the idea of settled administrative methods was definitely fixed and became of special importance in the field of finance. The systematizing spirit, so characteristic of both the Norman and Angevin kings, produced the great institution of the exchequer (q.v.) with its judicial and administrative sides, and its elaborate forms of account and control. Even before this organization was developed the Domesday Survey (see DOWNSAS BOOK)—now recognized as having a purely fiscal object (in Maitland's words "a tax book, a gold book ")—shows the movement towards careful observation of the sources of revenue. It is clear that William I initiated a policy which was followed by his successors, in spite of the serious difficulties of the period of anarchy during Stephen's nominal reign. The obscure question as to the real origin of the special contrivances employed by the exchequer to meet the exigencies of the times, is irrelevant to the financial inquirer, who may be content to hold that, granting the existence of some Old English analogies, the system, as it appears in the 12th century, was a peculiar product of the conceptions as to fiscal organization formed by Norman subtlety. It is the manner in which this institution held together and focused the revenues and expenditure of the kingdom that has to be considered. The picture presented by the "Dialogue of the Exchequer" (c. 1176) is that of a comprehensive system which secured the receipt of the royal income, and provided a thorough audit of the accounts by employing processes adapted to the circumstances of the time. It is, in fact, through the description of financial institutions that it is possible to ascertain the forms of revenue possessed by the crown. The ingenuity expended on the administrative machinery of the exchequer had as its aim the increase of the king's resources, an object in which the official class of churchmen and lawyers was deeply interested.

In order to understand the character of English finance in the middle ages it is absolutely essential to bear constantly in mind the identification of the king with the state. Though feudalism (q.v.) was, in one of its aspects, a powerful instrument for division of political authority, it, nevertheless, in the particular form in which the Conqueror introduced it into England, enabled the fiscal rights of the crown to be established in a more definite shape than was possible under the older condition. For, in the first place, the actual property of the crown was more carefully administered as each royal manor came under the system of accounting. Again, the various claims or dues of the king took more decidedly the feudal type and received stricter legal definition. Further, the higher judicial organization assisted the expansion of court fees; while, above all, the increased authority of the state made the casual receipts (for such they were) trade more profitable.

In a broad view the sources of revenue fall under the following heads: (1) The real estates which were distributed over England, derived in part from the possessions of the old English kings, but increased by the confiscations that followed the events of the Conqueror's reign, as well as by the doctrine that unwed land was the king's (terra regis). Over fourteen hundred manors appear in Domesday as royal property. The forests, placed under special laws, yielded little revenue, except in the form of penalties on offenders. The rural tenants, who at first paid their rents in produce, gradually commuted them into money payments. As the royal demesne was favourable for the growth of towns the rents derived from urban tenants became a valuable part of the yield from the demesne; this, later, took the shape of a payment from the town as a unit (the forma burgi), a method which secured to the burghers freedom from the exactions of the sheriff and which was purchased by special payments. (2) The feudal rights. These included the claim to military service; the three regular aids and the payments of relief at succession to a fief, as also the profits on wardsips and marriages. Escheats and forfeitures completed the list. The views of the Domesday Survey on the administration of the crown are kept within bounds by the resistance of the tenantry, as shown in the provisions of Magna Carta. (3) The administration of justice was a lucrative prerogative of the crown. Suitors had to pay for securing the hearing of their cases in addition to the fees for writs, and both amercements and compositions increased the receipts under this head. (4) Two special classes contributed to the royal exchequer. As a great deal of the wealth of the country was in the hands of the church the opportunities afforded by the vacancies of sees, abbacies and priories were utilized for the purpose of securing the profits of these offices during the time in which there was no occupant; and this term was frequently prolonged by the king's action or inaction. The Jewish, until their expulsion, were an even more profitable class to the revenue. Being under the absolute control of the crown, they could be taxed at pleasure, either by taking a percentage of their property (e.g. in one case one-fourth), or by levies for alleged offences. The existence of a separate exchequer for the Jews is an indication of their fiscal value. (5) Direct taxation formed an extraordinary and occasional head of revenue. The Danegeld was succeeded by the carucage, and the commutation of military service introduced the scutage, but these forms were of little immediate importance, though very significant for the future course of development. (6) Lastly come the dues claimed at the ports, which contain in germ the customs system of later times, though they rather resemble the harbour charges of modern ports and were very trivial in amount.

The history of the English financial system consists largely in the exhibition of the different fortunes of these several component parts of the exchequer receipts; for it must be remembered that the sheriff was bound to account to that tribunal for all that he should have received, and by this agency the local
contributions passed into the king's possession for the service of the state. During the century and a half that lay between the Conquest and the granting of the Great Charter the account given above holds good. The character of the ruler affected the vigour of the fiscal, as well as the general, administration. Henry I. and Henry II. secured much better results than Stephen or John; but the collection of the rent and profits of the royal manors and the feudal and other dues continued as the mainstay of revenue. Indications of change are, however, to be found. Thus the substitution of the "carucage" or plough tax for the "Dane-geld" marks an advance towards direct taxation of land through its produce, and the introduction of "scutage" is not only further evidence of the same tendency, but also a step in the development of "money economy" in place of the earlier "natural economy" or system of payments in kind. The special levies or "tallages" imposed at times of need on the towns in the king's demesne appear to have been a doubtful exercise of the royal prerogative, but scientifically they belong to the same class as the Dane-geld and scutage. Perhaps the most important advance made in this period is the beginning of taxation of moveables, first applied in the Saladin tithe of 1189 and, later, expanded into a general system.

In the reign of John (1199-1216) the loss of Normandy and the concession of the barons' demands by the issue of Magna Carta rendered final the readjustment. During the long reign of Henry III. the struggle to maintain the privileges granted by the Charter acted on the fiscal system by checking the arbitrary use of tallages, and as a consequence, the regular assessment of the tax on moveables, which was becoming more prominent. The fruitful idea that it was necessary to obtain the consent of the paysers of taxes before the imposition operated powerfully in favour of the establishment of bodies representing the several estates. It is through the reaction of constitutional on fiscal development that the transition from feudal to parliamentary taxation in its earlier form is made.

Almost at the opening of the age of parliamentary taxation one of the older sources of revenue ceased. The pressure of popular opinion forced Edward I. to decree the expulsion of the Jews (1290), though he naturally desired to retain such profitable subjects. It is, indeed, probable that, owing to the exactions practised on them, the Jewish usurers had become less serviceable to the exchequer; while it is certain that the general resources of the kingdom had so increased as to make their contribution relatively much smaller. The first effects of the representative influence in the fiscal domain are the abandonment of the tallages on employers of servants, as a matter of policy. The tax on moveables was framed in a more systematic way. Instead of distinct charges on different classes, or variations in proportion of levy from one-fourth to one-fortieth, the policy of imposing a tax of one-tenth on the towns and one-fifteenth on the counties was adopted. Greater strictness in assessment was sought by the appointment of commissioners for each county, supplied with special instructions as to taxable goods and exemptions. This method continued in force for the tax on moveables from 1290 till 1334, though in some cases the proportions imposed on the towns and counties were varied (e.g. an eighth and a fifth were granted in 1297, and a tenth and a sixth in 1322). A more general influence was the growing national economy which led to greater activity on the part of the king as administrator, and which also increased the need of the state for revenue. Though the doctrine that "The king should live of his own" was generally accepted as a constitutional maxim, the force of events was making it obsolete. From being an infrequent and uncertain kind of taxation the direct tax on moveables, which was practically absorbing the older forms, became usual and regular. Under medieval conditions the collection of a general property (under which, in fact, was the nature of "the tenth and fifth") presented serious difficulties. Each locality gained by keeping its assessment down to the lowest point, while the borough authorities were naturally not eager to enforce the charge on their fellow-citizens. England in the 14th century was not ripe for a system that has been found hard to make effective in more advanced societies. Hence, from 1334 onward, the method of "apportionment" was employed, i.e. the tenth and fifteenth was taken as affording a definite sum measured by the yield on the ancient valuation. As this gave in the aggregate, between £38,000 and £39,000, "the tenth and fifteenth" became for the future "practically a fiscal expression for a sum of about £39,000"; the total to be divided or "apportioned" between the several counties, cities and boroughs according to their former payments. This settlement, which remained in force for centuries and affected all the later direct taxes, had the great advantages of certainty and adaptability. The inhabitants of any particular town knew their total liability and could distribute it amongst themselves in the manner most convenient to them. From the royal standpoint also the arrangement was satisfactory, for the "tenth and fifteenth" could be multiplied (e.g. in 1352 three "tenth s and fifteenths" were voted for three years), and supplied a stable revenue for the service of the kingdom. To the parliament the power of regulating the policy of the crown by the bestowal or refusal of grants was naturally agreeable. Thus, all sections of the nation united in support of the system established in 1334, just before the opening of the Hundred Years' War, in connexion with which it was particularly serviceable.

To the tax that has just been described, at least in its nature as a direct impost, is the poll or capitation tax. Financial pressure at the close of Edward III.'s reign (1377) led to the adoption of a tax of fourpence per head on all persons in the kingdom (mendicants and persons under fourteen years being excepted). The "tallage of groats," which seems to be derived by analogy from the hearth money for Peter's pence, was followed by the graduated poll taxes of 1379 and 1380. In the former the scale ranged from ten marks (6:13:4) imposed on the royal dukes and the viscounts, through six marks on earls, bishops and abbots, and three on barons, down to the groat or fourpence payable by all persons over sixteen years of age. Such a form of taxation approximated—as Adam Smith saw—to an income tax, but it proved to be unproductive, only half of the estimated yield of £50,000 being obtained. The tax of 1386 varied within narrower limits; from twenty shillings to fourpence (or sixty groats to three), with the proviso that "the strong should aid the weak." But this particular tax is chiefly memorable as the occasion—whatever may have been the real causes—of the great "Peasants' Revolt" of 1381. This unlucky association sealed the fate of the poll tax as a fiscal expedient. It was abandoned, with one exception, for nearly three hundred years; and its occasional remittance in the 17th century did not result in its permanent revival. Apart from special circumstances it is plain that the "tenth and fifteenth" was better suited than the poll tax for the purpose of English finance. The machinery for collection was ready to hand for the former, while special agents had to gather the latter, even from the poorest classes. In fact, the episode of the poll taxes may be regarded as an attempt—fortunately unsuccessful—to relieve the property classes at the expense of the peasants and poorer burghers. Failure in this respect helped in the maintenance of the settlement of direct taxation devised in 1334.

Parallel with the evolution of direct taxation, but decidedly lagging behind, is the progress of indirect taxation. As already mentioned, the right of levying dues on goods entering or leaving English ports belonged from very early times to the king. Whether this power was, in its origin, due to the protection afforded to traders and thus a kind of insurance, or the result of the royal prerogative of pre-emption is immaterial for finance. What is established is that the "priseage" of wine or levy of one cask in ten, and the taking of one-tenth or one-fifteenth of other commodities was in force. Attempts to impose additional dues were forbidden by an important article (41) of the Great Charter which recognized "the ancient and just customs." One of the earliest effects of parliamentary influence is manifested in the establishment of duties on wool, woolfells and leather by Edward I.'s first parliament. After some efforts by the king to gather increased duties, the "Confirmation of the Charters"
ENGLISH FINANCE

(1 297) forbade any increases on the amounts fixed in 1275, which were henceforth known as the ancient customs. Another attempt was made to obtain a higher scale of duties by arrangement with the merchants. The foreign traders consented to the royal proposals, which comprised duties on wine, wool, hides and wax, as well as a general tax of 1½% on all imports and exports. Thus, in addition to the old customs of half a mark (6.8d.) per sack of wool and on each three hundred woolfells, and one mark (13.8. 4d.) per last or load of leather, the foreign merchants paid an extra duty (or surtax) of 50% and also 2s. on the tun of wine—the so-called "butlerage." The privileges granted in the Carta Mercatoria (1303) were probably the consideration for accepting these enhanced dues. The English merchants, however, for the time, successfully resisted the application in their case of the higher charges, and consequently remained under the old priage of wine. In spite of parliamentary opposition, on the ground that they amounted to an infringement of the Great Charter, the new customs were maintained in force. After being suspended in 1311 they were revived in 1322, confirmed by royal authority in 1328, and finally sanctioned by parliament in the Statute of the Staple (1333). They became a part of the permanent crown revenue from the ports, and, with the old customs, were the basis for further development.

In the second direct taxes were first supplemented by, and then absorbed in, the general taxation of the customs. Under these circumstances, the customs, in the strict sense, were followed by the subsidies or parliamentary grants. One great source of English wealth in the 14th century was the export of the peculiarly fine wool of the country, and the political circumstances of Edward III's time suggested the manipulation of the trade in this commodity for purposes of policy as well as revenue. Sometimes, in order to influence the towns of Flanders, the export of wool was absolutely prohibited; at others, export duties of varying amounts were imposed on wool, skins and leather. In the early years of the reign these arrangements were settled by agreement with the merchants. The subsidies of this class began in 1340 and henceforward were frequently granted, though complaints were very often made. Thus, in 1348 the Commons objected to the subsidy of an export duty of 2d. per sack on wool on the ground that it was really a tax on the landowners, who received a lower price for their wool in consequence of the duty. Bargains between the king and the merchants were forbidden, and this species of taxation was brought under parliamentary control by statutes passed in 1362 and 1371. Along with the special duties on wool there was an increase of the imposts on wine and general goods. By agreement with the merchants a duty of £20 in the tun on wine and 2½% on goods was levied in 1347. Between 1337 and 1376 these duties were established as parliamentary grants under the names of "Tunnage" and "Poundage," leaving the older dues intact.

One class of "estate" occupied a peculiar position. The clergy still claimed the privilege of self-taxation, and therefore it was convocation, not parliament, that voted the tenth imposed on clerical property. In some instances much heavier charges (e.g. in 1296 one-third) were decreed by the king, but the taxation of the clergy declined in productiveness during the 14th century. By the close of the reign of Richard II, the results of the transition from feudalism to a parliamentary constitution were practically complete. In respect to finance the most important of these were: (1) The disappearance or reduction to unimportance of the feudal dues. The fact that this change occurred at, relatively speaking, so early a date is of special significance for English development. (2) The royal demesne, though it had not suffered the losses that the grants of later times inflicted on it, had also lost some of its value as a source of revenue. (3) In compensation the direct taxation of property had become a ready means of supplying the growing requirements of the administration, and the mode of levy had been reduced to a well-recognized form, unsatisfactory experiments—such as the poll tax—being withdrawn. (4) The growth of import and export duties through the "old" and "new" customs and the subsidies furnished a large part of the requisite funds. In fact, in the course of a little over three hundred years the constituent parts of the public income had, without any violent change, been completely altered in relative value and in organization.

The period of the Lancaster kings, extending over two-thirds of the 15th century (1399-1471), is noticeable for various experiments in the system of direct taxation. The standard tax —"the tenth and fifteenth"—failed to suit the changed conditions. In consequence of the decay of some of the towns allowances had to be made to them, amounting to over 15% (£6,000), which, with other deductions, lowered the yield from a "tenth and fifteenth" to £31,000. As a supplement a land tax, affecting only the large owners, was voted at the rate of 5% in 1404, and repeated with wider scope, but at the lower rate of 1½% in 1411. A house tax made its appearance in 1428. Taxes on knight's fees and other freeholds were also tried, while in 1435 and 1450 the graduated income tax was employed. The minimum rate, 2½% applied to incomes under £100 (or under £20 in the tax of 1450), and rose to 10% on the higher incomes. These devices are evidence of the demand for larger revenue, and also of the increasing unfitness of the existing direct taxation. It may be added that they indicate a disposition to adopt foreign models, particularly the methods of taxation in use in France and Italy. As to indirect taxation the receipts seem at first to have been relatively small, and the subsidies were only granted for fixed periods (the victory of Agincourt gained a little grant to Henry V.).

After the establishment of Edward IV on the throne, the idea of a "tenth," in the literal sense, was taken up and voted (1472) by the two houses as a special military provision; but it failed to bring in the required revenue, and the king had to fall back on grants of the old-established form. Extra taxes on aliens were levied under both Lancastrian and Yorkist rulers with little profit. The most original contribution of Edward IV. to fiscal policy was the "benevolence" (q.v.) or payment by wealthy subjects of sums requested by the king. Voluntary in form, these payments were, in fact, compulsory, and became in later times one of the great grievances against which parliament had to struggle.

Broader issues in finance marked the course of the Tudor period, and these were connected with the general history of the time. The era of national monarchies had arrived, necessitating the maintenance of greater military and naval forces, as well as more costly machinery of administration. External policy was affected by the set of ideas that developed into mercantilism (see MERCANTILE SYSTEM); but so also was fiscal policy. Finance reflected the actions of the personal rule that was the characteristic of the 16th century. Within the period, however, some strong points of contrast are to be found. The period was marked by parsimony with Henry VII., followed by lavish prodigality in the case of Henry VIII. Elizabeth, again, presents in her reign a very different financial policy from that of either her father or her grandfather. The desire for a vigorous foreign policy, the hope of encouraging native industry, and the sentiment of retaliation against the trade regulations of other countries are found to interfere with the aim—strictly followed in earlier times—of obtaining the largest possible yield. All the different parts of the public economy were regarded as existing only in order to be utilized for the furtherance of national power. It is this more complex character in policy, coupled with the new influences, that the discovery of America, the Renaissance and the Reformation brought into operation, which gives special interest to the financial problems of the 16th century.

Taking in order the great heads of public income placed at the disposal of the sovereign, it appears that the first head of the old receipts—the crown lands—had been from time to time diminished by grants to the king's relatives and favourites, but had also gained through resumptions and forfeitures. On the whole, the loss and gain down to the close of the 14th century more or less balanced. The income from land was, however, diminished and declined in relative importance. It has been said that "it was in the 15th century that the great impoverishment of the crown estate began." The Lancaster kings (especially Henry VI.) lost most of the lands attached to the crown through pressure of expenditure and the wholesale plunder of officials.
ENGLISH FINANCE

Though the civil wars of the 15th century brought in many forfeited estates the grants of Edward IV., kept down the increase. But the chief opportunity for aggrandizement was afforded by the dissolution of the monasteries and gilds under Henry VIII. The great mass of property that passed into the royal possession in this way was in part assigned to nobles and officials, while most of the remainder was distributed in the reigns of his children. The dwindling importance of the public revenue from land and rent charges is as noticeable under the Tudors as in earlier times. In lieu the feudal dues had fallen into a very subordinate place notwithstanding the attempts made on particular occasions to enforce them with greater rigour. The force of personal monarchy exercised by the Tudors, depending as it did on popular support, tended to encourage the collection of duties which had a legal ground in preference to taxation of the community. Of similar character was the employment of the old right of purveyance (q.v.), in restraint of which a series of statutes had been passed.

Whatever possibilities of obtaining some additional revenue from the crown lands or prerogative rights may have existed in the 16th century, and these were slight, all the political and social conditions were more and more to make the need for taxation as the principal financial resource imperative. Amongst the cases of increased calls for funds to maintain the machinery of state, the rise of prices, due to increased supplies of the precious metals, must be included as one of the chief, and its effect extends into the 17th century. It was under this influence that the old forms of revenue became less profitable and that fresh developments were necessitated.

Direct taxation still retained in one of its branches the pattern set in the reign of Edward III. "Tenths and fifteenths" continued to be voted, and for some time all attempts to introduce new methods failed. In 1488 a military grant framed on the model of the abortive tax of 1472 yielded only a little over one third of the estimate (£27,000 out of £75,000), and the unsatisfactory result prevented further experiments on the part of Henry VII. The foreign policy of Henry VIII.—particularly his French expedition—accompanied by an attendant outcry, accounts for the graduated capitation tax of 1513, which was even less in accordance with anticipation than the tax of 1488 (it yielded only £50,000 instead of £160,000). But these failures cleared the way for a more effective form of direct impost, which appeared in the "subsidy" or general tax on land and goods. The first case of this tax (1514) was a modest one—2½%; it, however, soon took on a typical form, so that the subsidy came to mean a charge of 4s. in the pound on land and 2s. 8d. in the pound on goods, a scale evidently devised with reference to the older tenth and fifteenth, which was henceforth put in a subordinate position. The subsidy became the established mode of grant under both Tudors and Stuarts, though by degrees it underwent a change similar to that experienced by its predecessor. The taxing statutes made elaborate provisions for the assessment and collection of the tax in order to secure a full return. Old habits proved too strong and the subsidy "slipped into the same kind of groove as that of the fifteenth and tenth, and became, in practice, a grant of a sum of money of about the same amount as the yield of the last preceding subsidy" (Dowell). The consequence was that each subsidy came, in the middle of the 16th century, to be a sum of £100,000, and at its close only £80,000. The parallel vote of the clergy in convolution (which after 1533 had to be confirmed in parliament) amounted to £20,000. The usual parliamentary proceeding was to vote so many "tenth and fifteenths" and so many subsidies, e.g. Elizabeth's first parliament voted her "two fifteenths and a subsidy," or, taking the usual values, £160,000. At times of crisis such as the arrival of the Armada the votes were enlarged by granting more tenths and fifteenths and subsidies. The history of the subsidy is instructive as to the tendencies of direct taxation in all countries. The assessment becomes inelastic and approaches to a fixed sum. As the subsidy follows the course of the later medieval taxation, so it is the undesigned model of the later land and property tax.

In the history of the port duties under the Tudors the first point for notes is the life grant to each of the sovereigns of the subsidies on wool, hides and leather, together with tunnage at 3s. and poundage at 5%; thus, with the hereditary customs, supplying a considerable revenue for the crown's use. No better indication of the increased power and popularity of the monarchy could be found. The contrast with the suspicious and grudging attitude of the Plantagenet and Lancastrian parliaments is significant of the change in national sentiment. A duty on malmsey (1440) had a retaliatory rather than a fiscal aim, being directed against the Venetians who had imposed restrictions on English trade. In several later cases wine became liable to extra duties, chiefly applied to French trade in further pursuance of the policy of retaliation. Restrictions on import and export as well as the hostile measures against foreign merchants were matters of economic policy rather than finance, but they had the indirect effect of increasing the control exercised at the ports. The loss of Calais (1358) dislocated the staple and cut off one centre of customs revenue; and it was also probably the cause of an important change in the mode of valuing goods for duty. For the declaration on oath of the merchant a fixed valuation was substituted, and it appears that a scale of dock rates, the first of its class (1585). Following this reform came more stringent regulations against smuggling and fraud on the part of officials. All through the Tudor period the cost of collection was unduly high. For the first six years of Elizabeth it has been estimated at one-sixth of the gross receipts.

Just as in the 14th century the subsidy had followed the "old" and "new" customs, so in the 16th the "impositions" levied by royal prerogative formed a supplement to the parliamentary subsidy; but the principal employment of this expedient occurs in the next century. Another significant indication of the future course of indirect taxation was furnished by the grants of monopolies to inventors, producers and traders. These privileges, when they affected important commodities, operated in the same way as taxes farmed out to collectors, and, though the profit to the crown was small, they enhanced prices and excited discontent. The wisdom of Elizabeth (or her ministers) was shown in the promise of redress after the hostile debate of 1601.

From one point of view it may fairly be said that the great struggle of the Stuart kings with the parliament centred round financial issues. It is, at all events, beyond dispute that questions of taxation were the chosen ground of conflict. Taking the period from the accession of James I. to the opening of the Civil War (1603-42) it appears that the legal basis of indirect taxation was tested for the port duties in the "Great Case of Impositions" (known as Bates' case, see BATES, JOHN), while that of direct taxation was considered in the even more famous "Ship Money" case (for ever associated with the name of Hampden). In parliament the debates dealt with impositions, monopolies, the grounds for voting subsidies, and the proper application of the funds granted; in fact, with nearly all the financial questions of the time. Notwithstanding these difficulties and disputes the financial system shows evident signs of expansion and adaptation to the needs of the state.

The direct grants of the parliaments of James I. far exceeded those of the earlier periods (in 1606 six "fifteenths and tenths," three lay and four clerical subsidies), but the efforts to extend the other sources of revenue by the exercise of the prerogative naturally reacted on this spirit of liberality. The last "fifteenth and tenth" was voted in 1624, from which date this old-established form disappears, and the subsidy alone is used. In spite of Charles I.'s high-handed policy five subsidies were voted after the Petition of Right had been accepted, and even the Long Parliament made similar grants. Almost at the outbreak of the Civil War it also gave the king a graduated capital tax. Other modes of direct taxation were used without parliamentary sanction. The collection of the antiquated feudal dues was enforced through the special courts (particularly the Star Chamber) with a rigour long unknown; James had tried the French device of a "tariff of honors." Both kings employed...
ENGLISH FINANCE

The "benevolence" until the Petition of Right made such a levy illegal. But by far the most serious innovation was the collection of the "ship money," a course forced on Charles by his determination not to meet the representatives of the nation. The writs embodied the ultimate expression of the ingenuity of the king's advisers in the invention of means to enable him to rule without a parliament. The first writs secured over £100,000, and were followed by five further issues (1634-1639) bringing in an average return of £200,000 or about three lay subsidies. Like the "benevolence," the ship money was declared to be illegal (1641).

The contest respecting monopolies, settled by Elizabeth's withdrawal, was revived under James I., and had to be finally closed by the Statute of Monopolies (1624), declaring such grants to be utterly void. Certain exceptions (as in the case of the soapboilers) permitted the raising of revenue by what was in fact a rudimentary excise, and plans for a general excise were discussed, especially as a substitute for the feudal dues, though they were not reduced to practice. In the earlier 17th century the customs show a steady increase. From £1,100,000 in 1604 they rose to nearly £500,000 in 1641. This fourfold increase was due in part to the growth of English trade, but it was cemented by the "books of rates" in 1618 and 1625, fixing higher valuations, and by the inclusion of new commodities with definite duties. Wine, currants (the subject of controversy in Bates' case) and tobacco are particularly noticeable. Sugar also appears as a contributory. An interesting development was the adoption on a larger scale of the "farming" system, an evident imitation from France. A distinction was made between the "great," the "petty" and the "sugar" farms, and opportunities for gain were afforded to the officials. On the constitutional side the life grant of subsidies, made in accordance with Tudor usage to James, was temporarily withheld from Charles, a restriction which his own overbearing policy led the parliament to maintain. Practically, the whole customs revenue between 1628 and 1640 was raised by the use of the prerogative without any parliamentary sanction. The Tunnage and Poundage Act of 1641 pronounced definitely against the legality of any extra parliamentary customs and thus closed another of the constitutional problems of finance.

In the progress from the Conquest to the crisis of the Great Rebellion there is noticeable a practically complete shifting of the classes of revenue. The king had ceased "to live of his own"; the royal demesne and the prerogative rights included in feudalism had become very subordinate. The direct taxation of property and income, and the indirect taxation on imported or exported commodities became the principal forms of receipt.

In the long course of English financial history the nearest approach to the new departure and an abandonment of old devices is found at the time of the Civil War and Commonwealth. The actual outlines of the now existing system made their appearances, while the older portions of the revenue—particularly the survivals of feudalism—are eliminated. Thus the Civil War and the Interregnum (1642-60) may be regarded as marking a watershed in the financial history of the country. At the beginning of the struggle both sides had to rely on voluntary contributions. Plate and ornaments were melted down and useful commodities were furnished by the adherents of the king and by those of the parliament. As holding the revenues of London and the central organization the parliament voted subsidies and a poll tax. Such imports could hardly be levied with success and new forms became necessary. The direct taxation took the shape of a "monthly assessment" which was fixed from time to time, and which was collected under strict regulations, in marked contrast to the lax management of the former subsidies. As the amount for each district was fixed, the systematic collection secured "the more equitable adjustment of the burden of the tax as regards the various taxpayers" without hardship to the community. In spite of its origin, the "assessment" was the model for later taxation of property. The yield of this tax—exceeding for the whole period £32,000,000—is a proof of its importance. Minor contrivances, e.g. the "weekly meal" tax, in-
dicate the financial difficulties of the parliament, but are otherwise unimportant. Owing to its control of the sea and the principal ports the parliament was able to command the customs revenue; and in this case also it remodelled the duties, abolishing the wool subsidy and readjusting the general customs by a new book of rates. A more extensive tariff was adopted in 1656, and various restrictions in harmony with the mercantilist ideas of the time were enforced. Thus French wines, silk and wool were excluded from 1649 to 1656. Far more revolutionary in its effects was the introduction of the excise or inland duties on goods—a step which Elizabeth, James I. and Charles I. hesitated to take. Beginning (1645) with duties on ale, beer and spirits, it was soon extended to meat, salt and various textiles. Meat and domestic salt were relived in 1647, and the taxation became definitely established under the administration of commissioners appointed for the purpose. Powers to let out the collection to farmers was granted, and a bid for both excise and customs amounted in 1657 to £1,100,000. Confiscations of church lands and those belonging to royalists, feudal charges and special collections helped to make up the total of £33,000,000 raised during the nineteen years of this revolutionary period. Another mark of change was the removal of the excise to Oxford, leaving, however, the real fiscal machinery at the disposal of the committees that directed the affairs of the parliament. Under Cromwell the excise was re-established (1654) in a form suited for the changes in the finances, the office of treasurer being placed in the hands of commissioners.

A complete reconstruction of the revenue system became necessary at the Restoration. The feudal tenures and dues, with the prerogative rights of purveyance and pre-emption, which had been abolished by order of the parliament, could not be restored. Their removal was confirmed, and the new revenues that had been developed were resorted to as a substitute. Careful inquiry showed that just before the Civil War the king's annual revenue had reached nearly £300,000. The needs of the restored monarchy were estimated at £1,200,000 per annum, and the loyal spirit of the commons provided sources of revenue deemed sufficient for this amount. An hereditary excise on beer and ale was voted as a compensation for the loss of the feudal dues, and temporary excise on spirits, wine, coffee, tea, and tobacco, were adopted. In 1662 new customs and subsidies had disappeared under the Commonwealth. The general or "great statute" (1660) provided a scale of duties—5% on imports and exports, with special duties on wines and woollen cloths—accompanied by a new book of rates. A house tax, levied after the French pattern, on each hearth, was introduced in 1662 and became established. Poll taxes were used as an extraordinary resource, as were the last subsidies, voted in 1663, and then for ever abandoned. Licences on retailers and fees on law proceedings were further aids to the revenue, which, in the later years of Charles II. and in the short reign of his successor, was with difficulty kept up to the level of the increasing expenditure. The Commonwealth assessments were revived on several occasions, and indirect taxation was made more rigorous by the imposition of extra duties on brandy, tobacco and sugar, as also on French linens and silks. A very important development was the placing of the customs (1670) and the excise (1685) in the hands of special commissioners, who under the system of farming them out to private collectors. The approach to modern conditions is further evidenced by the greater care in the administration. Amongst expert officials Dudley North (p.s.), as commissioner of customs, was the most distinguished. In this period, too, the beginning of the public debt as in the appropriation of the bankers' deposits may be found.

The Revolution of 1688 may be regarded both on its constitutional and financial sides as the completion of the work of the Long Parliament. In the latter respect its chief effects were: (1) the transfer of the administration of the finances from the king’s nominees to officials under parliamentary control, (2) the consequent application of the revenue to the purposes designated by parliamentary appropriation, (3) the rapid expansion of the
various kinds of revenue, particularly the indirect taxes, (4) the rise and growth of the national debt, combined with the creation of an effective banking system: The greater part of the 18th century was occupied with the working out of these results.

The government of William III. had to face the expenses of a great war and to allay discontent at home. As a preliminary step to the necessary settlement of the revenue a return was prepared, showing the tax receipts at over £1,800,000 and the peace expenditure at about £1,100,000. Parliament accepted the view that £1,200,000 per annum would suffice for the ordinary requirements of the kingdom. It, further, introduced the system of the Civil List (q.e.) and assigned £600,000 for the fixed payments under that head, leaving the remainder to be appropriated for the other needs of the state. As the "hearth money" had proved to be a very unpopular charge, it was, in spite of its yield (£170,000), given up. The temporary excise duties were voted for "their majesties' lives" and the customs for a limited term. These branches of revenue were altogether insufficient to meet the pressure of the war outlay, and in consequence new heads of taxation—or old ones revived—came into use. A series of poll and capitation taxes were imposed between 1689 and 1691, and after that date abandoned for the same reason as that for the repeal of the hearth money. The monthly assessment was tried in 1688; then came an income tax followed by "twelve months' assessments" in 1690 and 1691. The way was thus prepared for the property tax of 1692, imposing a rate of 4s. in the pound on real estate, offices and personal property. The old difficulties of securing returns made the tax chiefly one on land. It was under the name of "the land tax" that it was generally known. The 4s. rate brought in £1,922,712, a return which declined in the following years. To meet this a fixed quota of nearly half a million (a 1s. rate) was adopted in 1697, the amount to be apportioned in specified sums to the several counties and towns. The framework of the tax remained without substantial change till 1798, the time of Pitt's redemption scheme. In 1696 houses were taxed 2s. each, with higher rates for extra windows. The beginning of the "window tax," licences on pedlars, and a temporary tax on the stocks of companies complete the imports of this kind. Stamp duties—initiated from Holland—were adopted in 1694 and extended in 1698: they mark the beginnings of the modern duties on transactions and the "death duties." Large additions were made to the excise. Breweries and distilleries were placed under charge, and such important commodities as salt, coal, malt, leather and glass were included in the list of taxable articles, but the two last mentioned were soon relieved for the time. The customs rates were also increased. In 1698 the general 5% duty was raised by the new subsidy to 10%. French goods became liable to surtaxes, first of 25%, afterwards of 50%; those of other countries had to pay similar charges of smaller amount. Spirits, wine, tea and coffee were taxed at special rates. How great was the expansion of the fiscal system may be best realized from the fact that during the comparatively short reign of William III. (1689-1702) the tax land produced £10,200,000, the customs £13,296,000, and the excise £13,650,000, or altogether £40,946,000. In the last year of the reign, the opening one of the 18th century, the returns from these taxes respectively were £15,346,000, £17,393,000, and £16,096,000, or a total exceeding three and a half millions. The removal of the regular export duties in respect of (a) domestic woollen manufactures, (b) corn, was the only alleviation of taxation, and in both cases it was due to special reasons of policy.

Quite as remarkable as the growth of revenue is the sudden appearance of the use of public loans. In earlier periods a ruler had accumulated treasure (Henry VII. left £1,800,000) or had pledged "his jewels or the customs or occasionally the persons of his friends for the payment" of his borrowings. Edward III.'s dealings with the Florentine bankers are well known; but it was only after the Revolution that the two conditions essential for a permanent public debt were realized, viz.: (1) the responsibility of the government to the people, and (2) an effective market for floating capital. At the close of the war in 1667 a debt of £21,500,000 had been incurred, over £16,000,000 of which remained due at William III.'s death. Connected with the public debt is the foundation of the Bank of England (see BANKING), which more and more became the agent for dealing with the state revenue and expenditure; though the exchequer continued to exist until 1834 as a real, even if antiquated institution.

Thus it is clear that by the end of the 17th century the new influences which date from the Civil War had brought into being all the elements of the modern financial system. Expenditure, revenue, borrowing to meet deficiencies are all, in a sense, developed into their present-day form. Increase in amount and some refinements in procedure, combined with improved views of public policy, are the only changes that occur later on.

Resolvedly, the 18th and 19th centuries exhibit several distinct periods with definite financial aspects. In the ninety years from the death of William III. (1702) to the outbreak of the Revolutionary War with France (1793) there are four serious wars, covering nearly thirty-five years. There is the long peace administration of Walpole, and there are the shorter intervals of rest following each of the contests. From the beginning of the war with the French Republic to the Peace of Verlovo there is a nearly unbroken war time of over twenty years. The forty years' peace is closed by the Crimean War (1854-56); and another forty years of peace ends with the South African War (1899-1902). During this time the older mercantilism passes into protectionism; and this, again, gives way before the gradual adoption of the free trade policy. At each time of war, taxation (particularly in the indirect form) and debt increase. Financial reform is connected with the maintenance of peace. Among the great financial ministers Walpole, the younger Pitt, Peel and Gladstone are conspicuous; while Huskisson's services in the kindred field of economic policy deserve special notice in their financial bearing.

By taking the several great heads of revenue in order it is comparatively easy to understand the nature of the progress made in subsequent years. (1) The land tax, established on a definite basis in 1692, was the great 18th century form of direct taxation. Variating in rate from 1s. (as in 1731) to 4s. (as in most war years), it was converted by Pitt in 1789 into a redeemable charge on the lands of each parish, and by this process has sunk from the amount of £1,011,000 in 1789 to £370,000 in 1907-1908. The great increase in other heads had impaired the value of the land tax as a fiscal support. (2) Parallel with the movement of the land tax but showing much more rapid growth was the excise of the 18th century. Most of the articles of common consumption were permanently taxed. Soap, salt, candles and leather are described by Adam Smith as taxed, and that taxation is unreservedly condemned by him. In 1739 the excise duties brought in £3,500,000. By 1792 they had risen to £10,000,000. Their continued expansion was due both to the wider area covered and to the increased consuming power of the country. (3) The customs were equally serviceable, and in their case the increased duties were even more considerable. The general 10% of 1698 became 15% in 1704, a fourth 5% was imposed in 1748, and in 1759 the general duties were raised to 25%. An easing of the duties was specially resorted to, and articles such as tea were subjected to increased duties. The American War of Independence brought about a further general increase of 10%, together with special extra duties on tobacco and sugar. In 1758 the customs revenue came to over £3,000,000. Two circumstances account for this slower growth. (1) The extreme rigour of the duties and prohibitions, aimed chiefly against French trade; and (2) the absence of care in estimating the point of maximum productiveness for each duty. Swift's famous saying that "in the arithmetic of the customs two and two sometimes made only one" is well exemplified in England at this time. The smuggler did a great deal of the foreign trade of the country. Efforts at reform were not, however, altogether wanting. Walpole succeeded in carrying several useful adjustments. He abolished the general duties on exports and also several of those on imported raw materials such as silk,
beaver, indigo and colonial timber. His most ambitious scheme—that for the warehousing of wine and tobacco in order to relieve exporters—failed, in consequence of the popular belief that it was the forerunner of a general excise. Walpole's treatment of the land tax, which he kept down to the lowest figure (15s.), and his earlier funding plan deserve notice. His determination to preserve peace assisted his fiscal reforms. Pitt's administration from 1783 to 1792 marks another great period of improvement.

The consolidation of the customs laws (1757), the reduction of the tea duty to nearly one-tenth of its former amount, the conclusion of a liberal commercial treaty with France, and the attempted trade arrangement with Ireland, tend to show that "Pitt would have anticipated many of the free trade measures of later years if it had been his lot to enjoy ten more years of peaceful administration." One of the financial problems which excited the interest and even the alarm of the students of public affairs was the rapid increase of the public debt. Each war caused a great addition to the burden; the intervals of peace showed very little diminution in it. From sixteen millions in 1702, the debt rose to £53,000,000 at the treaty of Utrecht (1713).

In 1745 it reached £78,000,000, at the close of the Seven Years' War it was £137,000,000, and when the American colonies had estabhshed their independence the elevation of the nation to a position of national bankruptcy led to the adoption of the device of a sinking fund, and in this ease Pitt's usual sagacity seems to have failed him. The influence of R. Price's theory induced the policy of assigning special sums for debt reduction, without regard to the fundamental condition of maintaining a real surplus.

The revolutionary and Napoleonic wars mark an important stage in English finance. The national resources were strained to the utmost, and the "whip and spur" of taxation was used on all classes of the community. In the earlier years of the struggle the expedient of borrowing enabled the government to avoid the more oppressive forms of charge; but as time went on every possible expedient was brought into play. One class of taxes had been organized during peace—the "assessed taxes" on houses, carriages, servants, horses, plate, &c. These duties were raised by several steps of 10% each until, in 1798, their total charge was increased threefold (for richer persons four- or fivefold) under the plan of a "triple assessment." The comparative yield of £9,600,000 prepared the way for the important development of the tax system—the introduction of the income tax in 1798. Though a development of the triple assessment, the income-tax was also connected with the permanent settlement of the land tax as a redeemable charge. It is possible to trace the progress of direct taxation from the scutage of Norman days through "the tenth and fifteenth," the Tudor "subsidies," the Commonwealth "monthly assessments," and the 18th century land tax, to the income-tax as applied by Pitt, and, after an interval of disuse, revived by Peel (1842). The immediate yield of the income-tax was rather less than was expected (£6,000,000 out of £7,500,000); but by alteration of the mode of assessment from that of a general declaration to returns under the several schedules, the tax became, first at 5%, afterwards at 10%, the most valuable part of the revenue. In 1815 it contributed 22% of the total receipts (i.e. £14,600,000 out of £67,000,000). If employed at the beginning of the war, it would probably have obviated most of the financial difficulties of the government. The window tax, which continued all through the 18th century, had been supplemented in the American War by a tax on inhabited houses (one of Adam Smith's many suggestions), a group to which the assessment taxes were naturally joined. During the 18th century the probate duty had been gradually raised, and in 1780 the legacy duty was introduced; but these charges were moderate in character and did not affect land.

Though the direct and quasi-direct taxes had been so largely increased, their growth was eclipsed by that of the excise and customs. With each succeeding year of war new articles for duties were detected and the rates of old taxes raised. The maxim, said to have guided the financiers of another country—"Wherever you see an object, tax it"—would fairly express the guiding policy of the English system of the early 19th century. Eatables, liquors, the materials of industry, manufactures, and the transactions of commerce had in nearly all their forms to pay toll. To take examples:—salt paid 15s. per bushel; sugar 30s. per cwt.; beer 10s. per barrel (with 45 s. per bushel on malt and a duty on hops); tea 96%, ad valorem. Timber, cotton, raw silk, hemp and bar iron were taxed, so were leather, soap, glass, candles, paper and starch. In spite of the need of revenue, many of the customs duties were framed on the protective system and thereby gave little returns; e.g. the import duty on salt in 1815 produced £547, as against £1,616,124 from excise; pill-boxes brought in 1865, sold, salt-petre 2d., with 1d. for the war duties. The course of the war taxation was marked by varied experiments. Duties were raised, lowered, raised again, or given some new form in the effort to find additional revenue. Some duties, e.g. that on knives, were abandoned as unproductive; but the conclusion is irresistible that the financial system suffered from over-complication and absence of principle. In the period of his peace administration Pitt was prepared to follow the teaching of The Wealth of Nations. The strain of a gigantic war forced him and his successors to employ whatever heads of taxation it was likely to bring in without settling popular prejudices. Along with the tax on debt, the income tax was added. For the next years it averaged £25,000,000 per annum, bringing the total to over £50,000,000. By the close of the war period in 1815 the total reached over £75,000,000, or a somewhat smaller annual increase—a result due to the adoption of more effective tax forms, and particularly the income tax. The progress of English trade was another contributing agency towards securing higher revenue. The import of articles such as tea advanced with the growing population; so that the tea duty of 96% yielded in 1815 no less than £3,591,000. It is, however, true that by the year just mentioned the tax system had reached its limit. Further extension (except by direct confiscation of property) was hardly possible. The war closed victoriously at the moment when its prolongation seemed undundraeable.

A particular aspect of the English financial system is its relation to the organization of the finance of territories connected with the English crown. The exchequer may be plausibly held to have been derived from Normandy, and wherever territory was annexed to England, its familiar at home seem to have been adopted. With the loss of the French possessions the older cases of the kind disappeared. Ireland, however, had its own exchequer, and Scotland remained a distinct kingdom. The 18th century introduced a remarkable change. One of the aims of the union with Scotland was to secure freedom of commerce throughout Great Britain, and the two revenue systems were amalgamated. Scotland was assigned a very moderate share of the land tax (under one-fortieth), and was exempted from certain stamp duties. The attempt to apply selected forms of taxation—custom duties (1764), stamp duties (1762), and finally the effort to collect the tea duty (1773)—to the American colonies are indications of a movement towards what would now be called "imperialist" finance. The complete plan of federation for the British empire, outlined by Adam Smith, is avowedly actuated by financial considerations. Notwithstanding the failure of this movement in the case of the colonies, the close of the century saw it successful in respect to Ireland, though separate financial departments were retained till after the close of the Napoleonic war. England's fiscal differences still existed: the excise and customs continued separate, as the exchequers and the passage from war to peace, the years between 1815 and 1820 may be said to mark a distinct step in the financial development of the country. The connected change in the Bank of England by the resumption of specie payments supports this view. Moreover, the political conditions in their influence on finance were undergoing a revolution. The landed interest, though powerful at the moment, had hitherto faced the rivalry of the wealthy manufacturing communities of the north of England, and it may be added that the influence of theoretic
discussion was likely to be felt in the treatment of the financial policy of the nation. Canons as to the proper system of administration, taxation and borrowing come to be noticed by statesmen and officials.

These influences may be followed out in their working by observing the chief lines of adjustment and modification that followed the conclusion of peace. Relieved from the extraordinary outlay of the preceding years, the government felt bound to propose reductions. With commendable prudence it was resolved to retain the income-tax at 5% (one-half of the former rate), and to join with this reduction the removal of some war duties on malt and spirits. Popular feeling against direct taxation was so strong that the income-tax had to be surrendered in toto, a course which seriously embarrassed the finances of the following years. For over twenty-five years the income-tax remained in abeyance, to the great detriment of the revenue system. Its revival by Peel (1842), intended as a temporary expedient, proved its services as a permanent tax: it has continued and expanded considerably since. Both the excise and customs at the close of the war were marked by some of the worst defects of a vicious kind of taxation. The former had the evil effect of restricting the progress of industry and hampering invention. The raw materials and the auxiliary substances of industry were mainly, and these were raised in price. The tendency to good glass specially illustrated the bad results of the excise. New processes were hindered and routine made compulsory.

The customs duties were still more restrictive of trade; as they practically excluded foreign manufactures, and were both costly and in many instances unproductive of revenue. As G. R. Porter has shown, the really profitable customs taxes were few in number. Less than a score of articles contributed more than nineteen-twentieths of the revenue from import duties. The duties on transactions, levied chiefly by stamps, were ill-grazed and lacking in comprehensiveness. From the standpoint of equity the ground for criticism was equally plain. The great weight of taxation fell on the poorer classes. The owners of land escaped giving any return for the property that they held under the state, and other persons were not taxed in proportion to their abilities, which had been long recognized as the proper criterion.

The grievance as to distribution has been modified, if not removed, by the great development of (1) the income-tax, (2) the "death" or inheritance duties. Beginning at the rate of 7d. per pound (1854-1854), the income-tax was raised to 1s. 4d., from which rate it was raised in 1856 and reduced to 2d. in 1874, it rose to 3d., then in 1874 to 8d., and by 1900 appeared to be fixed as a minimum at 1s., or 5% on income from property. The yield per penny on the £ has risen almost uninterruptedly. From £10,000 in 1842, it now exceeds £5,800,000, though the exemptions and abatements are much more extensive. In fact, all incomes of £3 per week are absolutely free (£160 in annum is the precise exemption limit), and an income of £1,500 derived from personal exertion pays less than 2½d. per pound, or 21%. The great productiveness of the tax is equally remarkable. From £5,500,000 in 1843 (with a rate of 7d.) the return rose to £32,580,000 in 1907-1910, having been at the maximum of £18,800,000 in 1902-1903, with a tax rate of 1½%. The income-tax thus supplies about one-fifth of the total revenue, or one-fourth of that obtained by taxation. Several fundamental questions of finance are connected with the taxation of income and have been dealt with by English practice. Small incomes claim lenient treatment, and, as mentioned above, this leniency means in England complete freedom. Again, earned incomes appear to represent lower ability to pay than unearned ones. Long refused on practical grounds (as by Gladstone, who held the concession of an abatement of 25% on earned incomes of £200 and under was granted in 1907), the question whether savings should be exempt from taxation as income has (with the exception of life insurance premiums) been decided in the negative. Allowances for depreciation and cost of repairs are partially recognized. Far more important than these special problems is the general one of increased tax rates on large incomes. Up to 1908-1909 the tax above the abatement limit of £700 remained strictly proportional; but opinion showed a decided tendency in favour of extra rates or a "super tax" on incomes above an assigned amount (e.g., £5,000), and this was included in the budget of 1909-1910 (see Income-Tax).

In close relation with the income-tax is the estate duty, with its adjuncts of Legacy and Succession Duties. After Pitt's failure to carry the succession duty in 1796, no change was made till Gladstone's introduction in 1853 of a duty on land and settled property parallel to the legacy duty on free personality. Apart from certain minor alterations, the really vital change was the extension in 1894 of the old Probate Duty into a comprehensive impost (entitled the Estate Duty) applicable to all the possessions of a deceased person. This "Inheritance Tax"—to give it its scientific title—operates as a complementary property tax, and is thus an addition to the contribution from incomes derived from large properties. By graduation the charges on large estates in 1908-1909 (before the proposal for further increase in 1909-1910) came to 10% on £1,000,000, and reached the maximum of 15% at £3,500,000. From the several forms of the "Inheritance Taxes" the national revenue gained £14,500,000, with £4 millions as a supplementary yield for local finance.

The immense expansion of direct taxation is evident on comparing 1840 with 1895. In the former year the Probate and legacy duties were only £152,000, and the other direct taxes, even including the "House duty," did not raise the total to £3,500,000. In 1908 the direct taxation of property and income supplied £51,500,000, or one-third of the total receipts against less than one-twentieth in 1840.

But though this wider employment of direct taxation—a characteristic of European finance generally—reduced the relative position of the taxation of commodities, there was a growth in the absolute amount obtained from this category of duties. There were also considerable alterations, the result of changes in the views respecting fiscal policy. At the close of the Great War the excise duties were at first retained, and even in some cases increased. After some years reforms began. The following articles amongst others were freed from charge: salt (1825); leather and candles (1830); glass (1843); soap (1833); and paper (1860). The guiding principles were: (1) the removal of raw materials from the list of goods liable to excise, (2) the limitation of the excise to a small number of productive articles, with (3) the placing of the greater part (practically nearly the whole) of this form of taxation on alcoholic drinks. This was done by means of rates and duties, the highest of its work. The large revenue of £35,700,000 in 1873-1895 was derived one-half from spirits (£17,700,000), over one-third from beer, while most of the remainder was obtained from business taxation in the form of licences, the raising of which was one of the features of the budget in 1900. As a feeder of the revenue the excise might be regarded as equal to the income-tax, but less to be relied on in times of depression. Valuable as were the reforms of the excise after 1820, they were insignificant as compared with the changes in the customs. The particular circumstances of English political life have led to perhaps undue emphasis being placed on this particular branch of financial development. Between 1820 and 1860 the customs system was transformed from a highly complicated arrangement of duties, pressing with severity on nearly all foreign imports, into a simple and easily understood set of charges on certain specially selected commodities. All favours or preferences to home or colonial producers disappeared. Expressed in financial terms, all duties were imposed "for revenue only," and estimated in reference to their productiveness. An assimilation between the excise and customs duties had accordingly taken place. The chapter of the development under the guidance of (1) Huskisson, (2) Peel, and (3) Gladstone are commonly regarded as part of the movement for Free Trade; but the financial working of the alteration is understood only by remembering that the duties removed by "tens" or by "hundreds" were quite trivial in yield, and did not involve any serious loss to the revenue. Perhaps the most remarkable feature of the English customs of the 19th century was the steadiness of the receipts. In spite of trade depressions,
commercial crises and sweeping changes in rates, the annual revenue in the period 1875-1900 only varied between £19,000,000 and £22,000,000, though, on balance, duties amounting to £30,000,000 were remitted. The potential resources of this branch of revenue were made evident in the rapid rise of the yield by the new taxation imposed for the South African War (1899-1902). In consequence of this increase the customs became equal to the excise in return, and, combined, they collected over £50,000,000 annually from the consummation of commodities. They accordingly afforded a counterpoise to the burden put on income and property, or, more accurately speaking, they obtained due, or somewhat more than due, contribution from the smaller incomes, particularly those of the working class.

The exemption of raw materials and food; the absence of duties on imported, as on home manufactures; the selection of a small number of articles for duty; the rather rigorous treatment of spirits and tobacco, were the salient marks of the English fiscal system which grew up in the 19th century. The part of the system most criticised was the very narrow list of dutiable articles. Why, it was asked, should a choice be made of certain objects for the purpose of imposing heavy taxation on them? The critics have been right that they were taken as typical of consumption in general and were easily supervised for taxation. Moreover, the sumptuary element is introduced by the policy of putting exceptionally heavy duties on spirits and tobacco, with lighter charges on the less expensive wines and beers. Facility of collection and distribution of taxation over a larger class appear to be the grounds for the inclusion of the tea and coffee duties, which are further supported by the need for obtaining a contribution of, roughly speaking, over half the tax revenue by duties on commodities. The last consideration led, at the beginning of the 20th century, to the sugar tax and the temporary duties on imported corn and exported coal.

As a support to the great divisions of income-tax, Death Duties, Excise and Customs, the stamps, fees and miscellaneous taxes are of decided service. A return of £9,000,000 was secured by stamp duties.

In recent years the so-called "non-tax" revenue largely increased, owing to the extension of the postal and telegraphic services. The real gain is not so great, as out of gross receipts of £22,000,000 over £17,500,000 is absorbed in expenses, while the carriage of ordinary letters seems to be the only profitable part of these services. Crown lands and rights (such as vintage charges) are of even less financial value.

One cardinal principle of the greatest English finance ministers has been the avoidance of deficits or undue surpluses. Gladstone's inheritance of doctrine from Peel was "to estimate expenditure liberally, to estimate revenue carefully, to make each year pay its own expenses, and to take care that your charge is not greater than your income." This method of treatment requires that taxation shall be productive in yield, and that it shall be so elastic as to admit of expansion, a function specially assigned to the income-tax. It may also be said to involve due care in the treatment of the national resources. The reaction of ill-chosen taxes on industry is a hindrance to their productiveness and their growth.

(C. F. B.)

ENGLISH HISTORY.—The general account of English history which follows should be supplemented for the earlier period by the article BRITAIN. See also SCOTLAND, IRELAND, WALES.

I. FROM THE LANDING OF AUGUSTINE TO THE NORMAN CONQUEST (600-1066)

The coming of Augustine to Kent the darkness which for nearly two centuries had enwrapped the history of Britain begins to clear away. From the days of Honorius to those of Gregory the Great the line of vision of the annalists of the continent was bounded by the Channel. As to what was going on beyond it, we have but a few casual gleams of light, just enough to make the darkness visible, from writers such as the author of the life of St Germanus, Prosper Tiro, Procopius, and Gregory of Tours. These notices do not, for the most part, square particularly well with the fragmentary British narrative that can be patched together from Gildas's "lamentable book," or the confused story of Nennius. Nor again do these British sources fit in happily with the English annals constructed long centuries after by King Alfred's scribes in the first edition of the Anglo-Saxon Chronicle. But from the date when the long-lost communication between Britain and Rome was once more resumed, the history of the island becomes clear and fairly continuous. The gaps are neither broader nor more obscure than those which may be found in the contemporary annals of the other kingdoms of Europe. The stream of history in this period is narrow and turbid throughout the West. Quite as much is known of the doings of the English as of those of the Visigoths of Spain, the Lombards, or the later Merovingians. The 7th century was the darkest of all the "dark ages," and England is particularly fortunate in possessing the Ecclesiastica historia of Bede, which, though its author was primarily interested in things religious, yet contains a copious chronicle of things secular. No Western author, since the death of Gregory of Tours, wrote on such a scale, or with such vigour and insight.
The conversion of England to Christianity took, from first to last, some ninety years (A.D. 597 to 685), though during the last thirty the ancient heathenism was only lingering on in remote corners of the land. The original missionary impulse came from Rome, and Augustine is rightly regarded as the evangelist of the English; yet only a comparatively small part of the nation owed its Christianity directly to the mission sent out by Pope Gregory. Wessex was won over by an independent adventurer, the Frank Birinus, who had no connexion with the earlier arrivals in Kent. The great kingdom of Northumbria, though its first Christian monarch Edwin was converted by Paulinus, a disciple of Augustine, relapsed into heathenism after his death. It was finally evangelized from quite another quarter, by Irish missionaries brought by King Oswulf from Columba's monastery of Iona. The church that they founded struck root, as that of Paulinus and Edwin had failed to do, and was not wrecked even by Oswald's death in battle at the hands of Penda the Mercian, the one strong champion of heathenism that England produced. Moreover, Penda was no sooner dead, smitten down by Oswald's brother Oswin, at the battle of the Winwaed (A.D. 655), than his whole kingdom eagerly accepted Christianity, and received missionaries, Irish and Northumbrian, from the victorious Oswin. It is clear that, unlike their king, the Mercians had no profound enthusiasm for the old gods. Essex, which had received its first bishop from Augustine's hands but had relapsed into heathenism after a few years, also owed its ultimate conversion to a Northumbrian preacher, Cedd, whom Oswin sent to King Sigebert after the latter had visited his court and been baptized, hard by the Roman wall, in 653.

Yet even in those English regions where the missionaries from Iona were the founders of the Church, the representatives of Rome were to be its organizers. In 664 the Northumbrian king Oswin, at the synod of Whitby, declared his adhesion to the Roman connexion, whether it was that he saw political advantage therein, or whether he realized the failings and weaknesses of the Celtic church, and preferred the more desirable methods of her rival. Five years later there arrived in England the great organizer, Archbishop Theodore of Tarsus, who bound the hitherto isolated churches of the English kingdoms into a well-compacted whole, wherein the tribal bishops paid obedience to the metropolitan at Canterbury, and met him frequently in national councils and synods. England gained a spiritual unity long ere she attained a political unity, for in those meetings, which were often attended by kings as well as by prelates, Northumbrian, West Saxon and Mercian first learnt to work together as brothers.

The English church.

In a few years the English church became the pride of Western Christendom. Not merely did it produce the great band of missionaries who converted heathen Germany—Willibrord, Suidbert, Boniface and the rest—but it excelled the other national churches in learning and culture. It is but necessary to mention Bede and Alcuin. The first, as has already been said, was the true historian who wrote during the first three centuries of the new era; the second became the pride of the court of Charles the Great for his unrivalled scholarship. At the coming of Augustine England had been a barbarous country; a century and a half later she was more than abreast of the civilization of the rest of Europe.

But the progress toward national unity was still a slow one. The period when the English kingdoms began to enter into the commonwealth of Christendom, by receiving the missionaries sent out from Rome or from Iona, practically coincides with the period in which the occupation of central Britain was completed, and the kingdoms of the conquerors assumed their final size and shape. Ælfthryth, the last heathen among the Northumbrian kings, cut off the Britons of the North from those of the West, by winning the battle of Chester (A.D. 613), and occupying the land about the mouths of the Mersey and the Dee. Cenwulf, the last monarch who ascended the throne of Wessex unbaptized, carried the boundaries of that kingdom into Mid-Somersetshire, where they halted for a long space. Penda, the last heathen king of Mercia, determined the size and strength of that state, by absorbing into it the territories of the other Anglian kingdoms of the Midlands, and probably also by carrying forward its western border beyond the Severn. By the time when the smallest kingdom was in a mélange of the Saxon states—Sussex—accepted Christianity in the year 686, the political geography of England had reached a stage from which it was not to vary in any marked degree for some 200 years. Indeed, there was nothing accomplished in the way of further encroachment on the Celt after 686, save Ine's and Cuthred's extension of Wessex into the valleys of the Tone and the Exe, and Offa's slight expansion of the Mercian frontier beyond the Severn, marked by his famous dyke. The conquests of the Northumbrian kings in Cumbria were ephemeral; what Oswin won was lost after the death of Egfrith.

That the conversion of the English to Christianity had anything to do with their slackening from the work of conquest it would be wrong to assert. Though their wars with the Welsh were not conducted with such ferocious cruelty as of old, and though (as the laws of Ine show) the Celtic inhabitants of newly-won districts were no longer exterminated, but received as the king's subjects, yet that the connection between Welsh and English did not cease because both were now Christians. The outward advance of the invaders would have continued, if only there had remained to attract them lands as desirable as those they had already won. But the mountains of Wales and the moors of Cornwall and Cumbria did not greatly tempt the settler. Moreover, the English states, which had seldom turned their swords against each other in the 5th or the 6th centuries, were engaged during the 7th and the 8th in those endless struggles for supremacy which seem so purposeless, because the hegemony which a king of energy and genius won for his kingdom always disappeared with his death. The "Bretwaldas," as the English seem to have called it, was the most ephemeral of dignitaries. This was but natural: conquest can only be enforced by the extermination of the conquered, or by their consent to amalgamate with the conquerors, or by garrisoning the land that has been subdued by settlers or by military posts. None of these courses were possible to a king of the 7th or 8th centuries: even in their heathen days the English were not wont to massacre their beaten kinsmen as they massacred the unfortunate Celt. After their conversion to Christianity the idea of exterminating other English tribes grew even more impossible. On the other hand, local particularism was so strong that the conquered would not, at first, consent to give up their natural independence and merge themselves in the victors. Such amalgamations became possible after a time, when many of the local royal lines died out, and unifying influences, of which a common Christianity was the most powerful, sapped the strength of tribal pride. But it is not till the 9th century that we find this phenomenon growing general. A kingdom like Kent or East Anglia, even after long subjection to a powerful overlord, rose and reasserted its independence immediately on the death of his heir. His successor had to make a fresh conquest if he felt himself strong enough. To garrison a district that had been overcome was impossible; the military force of an English king consisted of his military household of gesilifs, backed by the general levy of the tribe. The strength of Mercia or Northumbria might be mustered for a single battle, but could not supply a standing army to hold down the vanquished. The victorious king had to be content with tribute and obedience, which would cease when he died, or was beaten by a competitor for the position of Bretwald.

In the ceaseless strife between the old English kingdoms, therefore, it was the personality of the king which was the main factor in determining the hegemony of one state over another. If in the 7th century the successive great Supremacy of Northumbria—Edwin, Oswald, Oswin and Egfrith—were reckoned the chief monarchs of England, and exercised a widespread influence over the southern realms, yet each had to win his supremacy by his own sword; and when Edwin and Oswald fell before the savage heathen Penda, and Egfrith was cut off by the Picts, there was a gap of anarchy
before another king asserted his superior power. The same phenomenon was seen with regard to the Mercian kings of the 8th century; the long reigns of the two conquerors, Ethelbald and Offa, covered eighty years (716–796), and it might have been supposed that after such a term of supremacy Mercia would have remained permanently at the head of the English kingdoms. It was not so; Ethelbald in his old age lost his hegemony at the battle of Burford (752), and was murdered a few years after by his own people. Offa had to win back by long wars what his kinsman had lost; he became so powerful that we find the pope calling him Rex Anglorum, as if he were the only king in the island. He annexed Kent and East Anglia, overawed Northumbria and Wessex, both hopelessly faction-ridden at the time, was treated almost as an equal by the emperor Charles the Great, and died still at the height of his power. Yet the moment that he was dead all his vassals revolted; his successors could never recover all that was lost. Kent once more became a kingdom, and two successive Mercian sovereigns, Beornwulf and Ludica, fell in battle while vainly trying to recover Offa's supremacy over East Anglia and Wessex.

Supremacy of Mercia.

The ablest king in England in the generation that followed Offa was Ecgbert, a king of Whita, who long had been an exile abroad, and served for thirteen years as one of the captains of Charles the Great. He beat Beornwulf of Mercia at Ellandune (A.D. 843), permanently annexed Kent, to whose crown he had a claim by descent, in 829 received the homage of all the other English kings, and was for the remainder of his life reckoned as "Bretwalda." But it is wrong to call him, as some have done, "the first monarch of all England." His power was no greater than that of Oswiu or Offa had been, and the supremacy might perhaps have tarried with Wessex no longer than it had tarried with Northumbria or Mercia, if it had not chanced that the Danish raids were now beginning. For these invasions, paradoxical as it may seem, were the greatest efficient cause in the welding together of England. They seemed about to rend the land in twain, but they really cured the English of their desperate particularism, and drove all the tribes to take as their common rulers the one great line of native kings which survived the Danish storm, and maintained itself for four generations of desperate fighting against the invaders. On the continent the main effect of the Viking invasions was not that the Carolingian Empire fell into fragments, and had to aid in producing the numberless petty states of feudal Europe. In this island they did much to help the transformation of the more Bretwalship of Egcbert into the monarchy of all England.

Supremacy of Wessex.

Already ere Egcbert ascended the throne of Kent the new enemy had made his first tentative appearance on the British shore. It was in the reign of Beohtric, Egcbert's predecessor, that the pirates of the famous "three ships from Heretheland" had appeared on the coast of Dorset, and slain the sheriff "who would fain have known what manner of men they might be." A few years later another band appeared, rising unexpectedly from the sea to sack the famous Northumbrian monastery of Lindisfarne (793). After that their visits came fast and furious on the shore-line of every English kingdom, and by the end of Egcbert's reign it was they, and not his former Welsh and Mercian enemies, who were the old monarch's main source of trouble. But he brought his Bretwalship to a good end by inflicting a crushing defeat on them at Hingston Down, hard by the Tamar, probably in 856, and died early the year was out, leaving the ever-growing problem to his son, Athelwulf.

The cause of the sudden outpouring of the Scandinavian deluge upon the lands of Christendom at this particular date is one of the puzzles of history. So far as memory ran, the peoples beyond the North Sea had been seafaring races addicted to piracy. Even Tacitus mentions their fleets. Yet since the 5th century they had been restricting their operations to their own shores, and are barely heard of in the chronicles of their southern neighbours. It seems most probable that the actual cause of their sudden activity was the conquest of the Saxons by Charles the Great, and his subsequent advance into the peninsula of Denmark. The empire seemed to be threatening the independence of the North, and in terror and resentment the Scandinavian peoples turned first to strike at the encroaching Frank, and soon after to assail the other Christian kingdoms which lay behind, or on the flank of, the Empire. But their offensive action proved so successful and so profitable that, after a short time, the whole manhood of Denmark and Norway took to the pirate life. Never since history first began to be recorded was there such a supreme example of the potentialities of sea-power. Civilized Europe had been caught at a moment when it was completely destitute of a war-navy; the Franks had never been maritime in their tastes, the English seemed to have forgotten their ancient seafaring habits. Though their ancestors had been pirates as fierce as the Vikings of the 9th century, and though some of their later kings had led naval armaments—Edwin had annexed for a moment Man and Anglesea, and Egfrith had cruelly raved part of Ireland—yet by the year 800 they appear to have ceased to be a seafaring race. Perhaps the long predominance of Mercia, an essentially inland state, had something to do with the fact. At any rate England was as helpless as the Empire when first the Danes had appeared, and their Norwegian galleys began to cross the North Sea, and to beat down both the Frisian and the numberless forts of the invaders was not at first very great; their fleets were not national armaments gathered by great kings, but squadrons of a few vessels collected by some active and enterprising adventurer. Their original tactics were merely to land suddenly near some thriving seaport, or rich monastery, to sack it, and to take to the water again before the local militia could turn out in force against them. But such raids proved so profitable that the Vikings soon began to take greater things in hand; they began to ally themselves in confederacies: two, six or a dozen "sea-kings" would join their forces for something more than a desultory raid. With fifty or a hundred ships they would fall upon some unhappy region, harry it for many miles inland, and offer battle to the landsfolk unless the latter came out in overpowering force. And as their crews were trained warriors chosen for their high spirit, contending with a raw militia fresh from the plough, they were generally successful. If the odds were too great they could always retire to their ships, put to sea, and resume their predatory operations on some other coast three hundred miles away. As a result, as late as the 9th century they were safe from pursuit and annihilation. The only chance against them was that, caught too far from the base-port where they had run their galleys ashore, they might find their communication with the sea cut off, and be forced to fight for their lives surrounded by an infuriated countryside. But in the earlier years of their struggles with Christendom the Vikings seldom suffered a complete disaster; they were often beaten but seldom annihilated. Ere long they grew so bold that they would stay ashore for months, braving the forces of a whole kingdom, and sheltering themselves in great palisaded camps on peninsulas or islands when the enemy pressed them too hard. On well-guarded strongholds like Thanet or Sheppey in England, Norrnoutier at the Loire mouth, or the Isle of Wight, they defied the local magnates to evict them. Finally they took to wintering on the coast of England or the Empire, a preliminary to actual settlement and conquest. (See VIKING.)

King Egcbert died long ere the invaders had reached this stage of insolence. Athelwulf, his weak and kindly son, would undoubtedly have lost the titular supremacy of Wessex over the other English lords if he had lived. Ethelwulf of Mercia or Northumbria a strong king with leisure to concentrate his thoughts on domestic wars. But the Vikings were now showering such blows on the northern states that their unhappy monarchs could think of nothing but self-defence. They slew Redulf—king of Northumbria—in 844, took London in 851, despite all the efforts of Burgred of Mercia, and forced that sovereign to make repeated appeals for help to Athelwulf as his overlord. For though Wessex had its full share of Danish attacks it met them with a vigour that was not seen in
the other realms. The defence was often, if not always, successful; and once at least (at Aeta in 881) Æthelwulf exterminated a whole Danish army with "the greatest slaughter among the heathen host that had been heard of down to that day," as the Anglo-Saxon chronicler is careful to record. But though he might ward off blows from his own realm, he was helpless to aid Mercia or East Anglia, and still more the distant Northumbria.

It was not, however, till after Æthelwulf's death that the attack of the Danes developed its full strength. The fifteen years (856-871) that were covered by the reigns of his three shortlived sons, Æthelbald, Æthelbert and Æthelred, were the most miserable that England was to see. Assembling in greater and greater numbers, the Danes fell upon the northern kingdoms, and there they found it easier to harry than to conquer and occupy them. A league of many sea-kings which called itself the "great army" slew the last two sovereigns of Northumbria and stormed York in 867. Some of the victors settled down there to lord it over the half-extirminated English population. The rest continued their advance southward. East Anglia was conquered in 870; its last king, Edmund, having been defeated and taken prisoner, the Danes slew him to death with arrows because he would not worship their gods. His realm was annexed and partly settled by the conquerors.

The fate of Mercia was hardly better: its king, Burgred, by constant payment of tribute, bought off the invaders for a space, but the eastern half of his realm was reduced to a wilderness.

Practically masters of all that lay north of Thames, the "great army" next moved against Wessex, the only quarter where a vigorous resistance was still maintained against them, though its capital, Winchester, had been sacked in 864. Under two kings named Halfdan and Bacsceg, and six earls, they seized Reading and began to harry Berkshire, Surrey and Hampshire. King Æthelred, the third son of Æthelwulf, came out against them, with his young brother Alfred and all the levies of Wessex. In the year 871 these two gallant kinsmen fought no less than six pitched battles against the invaders. Some were victories — notably the battle of Ashdown, where Alfred first won his name as a soldier — but the English failed to capture the fortified camps of the Danes. At Reading, and were finally beaten at Marten ("Mearctan") near Bedwyn, where Æthelred was mortally wounded.

He left young sons, but the men of Wessex crowned Alfred king, because they needed a grown man to lead them in their desperate campaigning. Yet his reign opened inauspiciously: defeated near Wilton, he offered in despair to pay the Danes to depart. He must have known, from the experience of Mercian, Northumbrian and Francish kings, that such blackmail only bought a short respite, but the condition of his realm was such that even a moderate time for reorganization might prove valuable. The enemy had suffered so much in the "year of the six battles" that they held off for some space from Wessex, seeking easier prey on the continent and in northern England. In 874 they harried Mercia so cruelly that King Burgred fled in despair to Rome; the victors divided up his realm, taking the eastern half for themselves, and establishing in it a confederacy, whose jarls occupied the "five boroughs" of Stamford, Lincoln, Derby, Nottingham and Leicester. But the western half they handed over to "an unwise thegn named Ceolwulf," who bought for a short space the precarious title of king by paying great tribute.

Alfred employed the four years of peace, which he had bought in 871, in the endeavour to strengthen his realm against the inevitable return of the raiders. His wisdom was shown by the fact that he concentrated his attention on the one device which must evidently prove effective for defence, if only he were given time to perfect it — the building of a national navy. He began to lay down galleys and "long ships," and hired "pirates" — renegade Danes without doubt — to train crews for them and to teach his men seamanship.

The scheme, however, was only partly completed when in 876 three Danish kings entered Wessex and resumed the war. But Alfred blocked them first in Wareham and then in Exeter. The fleet which was coming to carry them off, or to bring them reinforcements, fought an indecisive engagement with the English ships, and was wrecked immediately after on the cliffs of the Isle of Purbeck, where more than 100 galleys and all their crews perished. On hearing of this disaster the Danes in Exeter surrendered the place on being granted a free departure.

Yet within a few months of this successful campaign Alfred was attacked at midwinter by the main Danish army under King Guthrum. He was apparently taken by surprise by an assault at such an unusual time of the year, and was forced to escape with his military household to the Isle of Athelney among the marshes of the Parrett. The invaders harried Wiltshire and Hampshire at their leisure, and vainly thought that Wessex was at last subdued. But with the spring the English rallied: a Danish force was cut to pieces before Easter by the men of Devonshire. A few weeks later Alfred had issued from Athelney, had collected a large army in Selwood, and went out to meet the enemy in the open field. He beat them at Edington in Wiltshire, blockaded them in their great camp at Chippenham, and in fourteen days starved them into surrender. The terms were that they should give hostages, that they should depart for ever from Wessex, and that their king Guthrum should do homage to Alfred as overlord, and submit to be baptized, with thirty of his chiefs.

Not only were all these conditions punctually fulfilled, but (what is more astonishing) the Danes had been so thoroughly cured of any desire to try their luck against the great king that they left him practically unmolested for fourteen years (878-892). King Guthrum settled down as a Christian sovereign in East Anglia, with the bulk of the host that had capitulated at Chippenham. Of the rest of the invaders one section established a petty kingdom in Yorkshire, but those in the Midlands were subject to no common sovereign but lived in a loose confederacy under the jarls of the "Five Boroughs" already named above. The boundary between English and Danes established by the peace of 878 is not perfectly ascertained, but a document of
Military reforms were only one section of the work of King Alfred during the central years of his reign. It was then that he set afoot a comprehensive scheme for the restoration of the learning and culture of England which would endure for the long years of disaster which had preceded his accession. How he gathered scholars from the continent, Wales and Ireland; how he collected the old heroic poems of the nation, how he himself translated books from the Latin tongue, started schools, and set his scribes to write up the Anglo-Saxon Chronicle, is told elsewhere, as are his mechanical inventions, his buildings, and his dealings with missionaries and explorers (see Alfred).

The test of the efficiency of his work was that it held firm when, in his later years, the Danish storm once more began to beat against the shores of Wessex. In the years 892–896 Alfred was assailed from many sides at once by viking fleets, of which the most important was that led by the great freebooter Hasting. Moreover, the settled Danes of eastern England broke their oaths and gave the invaders assistance. Yet the king held his own, with perfect success if not with ease. The enemy was checked, beaten off, followed up rapidly whenever he changed his base of operation, and hunted repeatedly all across England. The campaigning ranged from Appledore in Kent to Exeter, from Chester to Shoeburyness; but wherever the invaders transferred themselves, either the king, or his son Edward, or his son-in-law Æthelred, the ealdorman of Mercia, was promptly at hand with a responsive army. The camps of the Danes were stormed; their fleet was destroyed in the river Lea in 895; and at last the remnant broke up and dispersed, some to seek easier plunder in France, others to settle down among their kinsmen in Northumbria or East Anglia.

Alfred survived for four years after his final triumph in 896, to complete the organization of his fleet and to repair the damages done by the last four years of constant fighting. He died on the 26th of October 900, leaving Wessex well armed for the continuance of the struggle, and the inhabitants of the “Danelagh” much broken in spirit. They saw that it would never be in their power to subdue all England. Within a few years they were to realize that it was more probable that the English kings would subdue them.

The house of Wessex continued to supply a race of hard-fighting and capable monarchs, who went on with Alfred’s work. His son, Edward the Elder, and his three grandsons, Æthelstan, Edmund and Edred, devoted themselves for fifty-five years (A.D. 900–955) to the task of conquering the Danelagh, and ended by making England into a single united kingdom, not by admitting the conquered to homage and tribute, in the old style of the 7th century, but by their complete absorption. The process was not so hard as might be thought; when once the Danes had settled down, had brought over wives from their native land or taken them from among their English vassals, had built themselves farmsteads and accumulated flocks and herds, they lost their old advantage in contending with the English. Their strength had been their mobility and their undisputed command of the sea. But now they had possessions of their own to defend, and could not raid at large in Wessex or Mercia without exposing their homes to similar molestation. Moreover, the fleet which Alfred had built, and which his successors kept up, disputed their mastery of the sea, and ended by achieving a clear superiority over them. Unity of plan and unity of command was also on the side of the English. The inhabitants of the three sections of the Danelagh were at best led in a many-headed confederacy. Their opponents were led by kings whose orders were punctually obeyed from Shrewsbury to Dover and from London to Exeter. It must also be remembered that in the greater part of the land which they possessed the Danes were but a small minority of the population. After their first fury was spent they no longer exterminated the conquered, but had been content to make the Mercians and Deirans their subjects, to take the best of the land, and exact tribute for the rest. Only in Lincolnshire, East Yorkshire and parts of Nottinghamshire and Leicestershire do they seem to have settled thickly
and formed a preponderating element in the countryside. In the rest of the Midlands and in East Anglia they went only a governing oligarchy of scanty numbers. Everywhere there was an English lower class which welcomed the advent of the conquering kings of Wessex and the fallen of the Danish jarls.

Edward the Elder spent twenty-five laborious years first in repelling and repaying Danish raids, then in setting to work to subdue the raiders. He worked forward into the Danelagh, building _burhs_ as he advanced, to hold down each district that he won. He was helped by his brother-in-law, the Mercian ealdorman Æthelred, and, after the death of that magnate, by his warlike sister Æthelfled, the ealdorman's widow, who was continued in her husband's place. While Edward, with London as his base, pushed forward into the eastern counties, his sister, starting from Warwick and Stafford, encroached on the Danelagh along the line of the Trent. The last Danish king of East Anglia was slain in battle in 918, and his realm annexed. Æthelfled won Derby and Leicester, while her brother reduced Stamford and Nottingham. Finally, in 921, not only was the whole land south of the Humber subdued, but the Yorkshire Danes, the Welsh, and even—_it_ is said—the remote Scots of the North, did homage to Edward and became his men.

In 925 Edward became a _kingsman_, that is, the founder of East Anglia, and the real beginning of the history of the nation. Æthelstan, who completed the reduction of the Danelagh by driving out Guthfrith, the Danish king of York, and annexing his realm. But this first conquest of the region beyond Humber had to be repeated over and over again; time after time the Danes rebelled and proclaimed a new king, aided sometimes by bands of their kinsmen from Ireland or Norway, sometimes by the Scots and Strathclyde Welsh. Æthelstan's greatest and best-remembered achievement was his decisive victory in 937 at Brunanburh—an unknown spot, probably by the Solway Firth or the Ribble—over a great confederacy of rebel Danes of Yorkshire, Irish Danes from Dublin, the Scottish king, Constantine, and Eugenius, king of Strathclyde. Yet even after such a triumph Æthelstan had to set up a Danish _king_ in York, in Yorkshire, apparently despairing of holding it down as a shire governed by a mere ealdorman. But its overlordship he never lost, and since he also maintained the supremacy which his father had won over the Welsh and Scots, it was not without reason that he called himself on his coins and in his charters _Rex totius Britanniae_. Occasionally he even put the title _Basilisk_, as if he claimed a quasi-imperial position.

The trampling out of the last embers of Danish particularism in the North was reserved for Æthelstan's brothers and successors, Edmund and Edred (940-955), who put down several risings of the Yorkshiresmen, one of which was aided by a rebellion of the Midland Danes of the Five Boroughs. But the unrivaled perseverance of the house of Alfred was at last rewarded by success. After the expulsion of the last rebel king of York, Eric Haraldson, by Edred in 948, we cease to hear of trouble in the North. When next there was rebellion in that quarter it was in favour of a Wessex prince, not of a Danish adventurer, and had no sinister national significance. The descendants of the vikings were easily incorporated in the English race, all the more so because of the wise policy of the conquering kings, who readily employed and often promoted to high station men of Danish descent who showed themselves loyal—and this not only in the secular but in spiritual offices. In 942 Ola, a full-blooded Dane, was made bishop of Exeter. The Danelagh became Danes and earls, ruled by officials who were often of Danish as of English descent.

It is notable that when, after Edred's death, there was civil strife, owing to the quarrel of his nephew Edwy with some of his kinsmen, ministers and bishops, the rebels, who included the majority of the Mercians and Northumbrians, set up as their pretender to the throne not a Dane but Edwy's younger brother Edgar, who ruled for a short time north of Thames, and became sole monarch on the death of his unfortunate kinsman.

The reign of Edgar (959-975) saw the culmination of the power of the house of Alfred. It was untroubled by rebellion or by foreign invasions, so that the king won the honourable title of _Rex Pacificus_. The minor sovereigns of Britain owned him as overlord, as they had owned his grandfather Edward and his uncle Æthelstan. It was long remembered "how all the kings of this island, both the Welsh and the Scots, eight kings, came to him once upon a time on one day and all bowed to his governance." The eight were Kenneth of Scotland, Malcolm of Strathclyde, Maccus of Man, and five Welsh kings. There is fair authority for the well-known legend that, after this meeting at Chester, he was rowed in his barge down the Dee by these potentates, such a crew as never was seen before or after, and afterwards exclaimed that those who followed him might now truly boast that they were kings of all Britain.

Edgar's chief counsellor was the famous archbishop Dunstan, to whom no small part of the glory of his reign has been ascribed. This great prelate was an ecclesiastical reformer—a leader in a movement for the general purification of morals, and especially for the repression of simony and evil-living among the clergy—a great builder of churches, and a stringent enforcer of the rules of the monastic life. But he was also a busy statesman; he played his share in the considerable body of legislation which was enacted in Edgar's reign, and is said to have encouraged him in his policy of treating Dane and Englishman with exact equality, and of investing the one no less than the other with the highest offices in church and state.

Edgar's life was too short for the welfare of his people—he was only in his thirty-third year when he died in 975, and his sons were young boys. The hand of a strong man was still needed to keep the peace in the newly-constituted realm of all England, and the evils of a minority were not long in showing themselves. One section of the magnates had possession of the thirteen-year-old king Edward, and used his name to cover their ambitions. The other was led by his step-mother Ælfthryth, who was set on pushing the claims of her son, the child Æthelred. After much factious strife, and many stormy meetings of the Witan, Edward was murdered at Corfe in 978 by some thegns of the party of the queen-dowager. The crime provoked universal indignation, but since there was no other prince of the house of Alfred available, the magnates were forced to place Æthelred on the throne: he was only in his eleventh year, and at least personally innocent of culpability in his father's death.

With the accession of Æthelred, the "Redeless," as he was afterwards called from his inability to discern good counsel from evil, and the consistent incapacity of his policy, an evil time began. The retirement from public life of Edgar's old minister Dunstan was the first event of the new reign, and no man of capacity came forward to take his place. The factions which had prevailed during the reign of Edward "the Martyr" seem to have continued to rage during his brother's minority, yet Æthelred's earliest years were his least disastrous. It was hoped that when he came to _man_-'s estate things would improve, but the reverse was the case. The first personal action recorded of him is an unjust harrying of the goods of his own subjects, when he besieged Roch-stere, because he had quarrelled with his bishop over certain lands, and was bribed to depart with 100 pounds of silver. Yet from 978 to 991 no irreplicable harm came to England; the machinery for government and defence which his ancestors had established seemed fairly competent to defend the realm even under a wayward and often criminal monarch. The signs of vikings are recorded, but the ravaging was purely local, and the invader soon departed. No trouble occurred in the Danelagh, where the old tendency of the inhabitants to take sides with their pagan kinsmen from over the sea appears to have completely vanished. But the vikings had apparently learnt by small experiments that England was no longer guarded as she had been in the days of Alfred or Æthelstan, and in 991 the first serious invasion of Æthelred's reign took place. A large fleet came ashore in Essex, and, after a hard fight with the ealdorman Brihtnoth at Maldon, slew him and began to ravage the district north of the Thames.
Instead of making a desperate attempt to drive them off, the king bribed them to depart with 10,000 pounds of silver, accepting it as a cowardly advice from archbishop Sigebert. The fatal precedent soon bore fruit; the invaders came back in larger numbers, headed by Olaf Tryggveson, the celebrated adventurer who afterwards made himself king of Norway, and who was already a pretender to its throne. He was helped by Sweyn, king of Denmark, and the two together laid siege to London in 994, but were beaten off by the citizens. Nevertheless Æthelred for a second time stooped to pay tribute, and bought the departure of Dane and Norwegian with 16,000 pounds of silver. There was a precarious interval of peace for three years after, but in 997 began a series of invasions led by Sweyn which lasted for seventeen years, and at last ended in the complete subjection of England and the flight of Æthelred to Normandy. It should be noted that the invader during this period was no mere adventurer, but king of all Denmark, and, after Olaf Tryggveson’s death in 1000, king of Norway also. His power was something far greater than that of the Guthrums and Alans of an earlier generation, and—in the end of his life at least—he was aiming at political conquest, and not either at mere plunder or at finding new settlements for his subjects. But if the strength of the invaders was greater than that of his predecessors, his power was far better equipped for war than those of the 9th century. He owned, and he sometimes used—but always to little profit—a large fleet, while all England instead of the mere realm of Wessex was at his back.

Any one of the great princes of the house of Egbert who had reigned from 871 to 975, would have fought a winning fight with such resources, and it took nearly twenty years of Æthelred’s tried incapacity to lose the game. He did, however, succeed in undoing all the work of his ancestors, partly by his own slackness and sloth, partly by his choice of corrupt and treacherous ministers. For the two ealdormen whom he delighted to honour and placed at the head of his armies, Ælfric and Eadric Streona, are accused, the one of persistent cowardice, the other of underhand intrigue with the Danes. Some of the local magnates made a desperate defence of their own regions, especially Ulfkytel of East Anglia, a Dane by descent; but the central government was at fault. Æthelred’s army was always at the wrong place—if the enemy were east then was the west held back, and if the were north then was the south force held south. "When Æthelred did appear it was more often to pay a bribe to the invaders than to fight. Indeed the Danegeld, the tax which he raised to furnish tribute to the invaders, became a regular institution: on six occasions at least Æthelred bought a few months of peace by sums ranging from 10,000 to 48,000 pounds of silver.

At last in the winter of 1013–1014, more as it would seem from sheer disgust at their king’s cowardice and incompetence than because further resistance was impossible, the English gave up the struggle and acknowledged Æthelred as king. First Northumbria, then Wessex, then London yielded, and Æthelred was forced to fly over seas to Richard, duke of Normandy, whose sister he had married as his second wife. But Sweyn survived his triumph little over a month; he died suddenly at Gainsborough on the 3rd of February 1014. The Danes hailed his son Canute, a lad of eighteen, as king, but many of the English, though they had submitted to a hard-handed king like Sweyn, were not prepared to be handed over like slaves to his unfriended successor. There was a general rising, the old king was broached over from Normandy, and Canute was driven out for a moment by force of arms. He returned next year with a greater army to hear soon after of Æthelred’s death (1016). The witan chose Edmund “Ironside,” the late king’s eldest son, to succeed him, and as he was a hard-fighting prince of that normal type of his house to which his father had been such a disgraceful exception, it seemed probable that the Danes might be beaten off. But Æthelred’s favourite Eadric Streona adhered to Canute, fearing to lose the office and power that he had enjoyed for so long under Æthelred, and prevailed on the magnates of part of Wessex and Mercia to follow his example. For a moment the curious phenomenon was seen of Canute reigning in Wessex, while Edmund was making head against him with the aid of the Anglo-Danes of the “Five Boroughs” and Northumbria. There followed a year of desperate struggle: the two young kings fought five pitched battles, fortune seemed to favour Edmund, and the traitor Eadric submitted to him with all Wessex. But the last engagement, at Assandun (Ashingdon) in Essex went against the English, mainly because Eadric again betrayed the national cause and deserted to the enemy.

Edmund was so hard hit by this last disaster that he offered to divide the realm with Canute; they met on the isle of Alney near Gloucester, and agreed that the son of Æthelred should keep Wessex and all the South, London and East Anglia, while the Dane should have Northumbria, the “five boroughs” and Eadric’s Mercian earldom. But ere the year was out Edmund died: secretly murdered, according to some authorities, by the infamous Eadric. The witan of Wessex made no attempt to set on the throne either one of the younger sons of Æthelred by his Norman wife, or the infant heir of Edmund, but chose Canute as king, preferring to reunite England by submission to the stranger rather than to submit to the despairing English.

They were wise in so doing, though their motive may have been despair rather than long-sighted policy. Canute became more of an Englishman than a Dane: he spent more of his time in his island realm than in his native Denmark. He paid off and sent home the great army with whose aid he had won the English crown, retaining only a small bodyguard of “house-carls” and trusting to the loyalty of his new subjects. There was no confiscation of lands for the benefit of intrusive Danish settlers. On the contrary Canute had more English than Danish courtiers and ministers about his person, and sent many Englishmen as bishops and some even as royal officers to Denmark. It is strange to find that—whether from policy or from affection—he married King Æthelred’s young widow Emma of Normandy, though she was somewhat older than himself—so that his son King Harthacnut and that son’s successor Edward the Confessor, the heir of the line of Wessex, were half-brothers. It might have been thought likely that the son of the pagan Sweyn would have turned out a mere hard-fighting Viking. But Canute developed into a great administrator and a friend of learning and culture. Occasionally he committed a harsh and tyrannical act. Though he need not be blamed for making a prompt end of the traitor Eadric Streona and of Ûhtred, the turbulent earl of Northumbria, at the commencement of his reign, there are other and less justifiable deeds of blood to be laid to his account. But they were but few; for the most part his administration was just and wise as well as strong and intelligent.

As long as he lived England was the centre of a great Northern empire, for Canute reconquered Norway, which had lapsed into independence after his father’s death, and extended his power into the Baltic. Moreover, all the so-called Scandinavian colonists in the Northern Isles and Ireland owned him as overlord. So did the Scottish king Malcolm, and the princes of Wales and Strathclyde. The one weak point in his policy that can be detected is that he left in the hands of Malcolm the Bernician district of Lothian, which the Scot had conquered during the anarchy that followed the death of Æthelred. The battle of Carham was in such a way given this land to the Scots. Canute wanted to draw the border line of England at the Tweed instead of at the Firth of Forth, when Malcolm did him homage. Strangely enough it was this cession of a Northumbrian earldom to the Northern king that ultimately made Scotland an English-speaking country. For the Scottish kings, deserting their native Highlands, took to dwelling at Edinburgh among their new subjects, and first the court and afterwards the whole of their Lowland subjects were gradually assimilated to the Northumbrian nucleus which formed both the most fertile and the most civilized portion of their enlarged realm.

The fact that England recovered with marvellous rapidity from the evil effects of Æthelred’s disastrous reign, and achieved great wealth and prosperity under Canute, would seem to show that the ravages of Sweyn, widespread and ruthless though they
had been, had yet fallen short of the devastating completeness of those of the earlier vikings. He had been more set on exacting tribute than on perpetrating wanton massacres. A few years of peace and wise administration seem to have restored the realm to a satisfactory condition. A considerable mass of his legislation has survived to show Canute's care for law and order.

Canute died in 1035, aged not more than forty or forty-one. The crown was disputed between his two sons, the half-brothers Harold and Harthacnut; it was doubtful whether the birth of the elder prince was legitimate, and Queen Emma strove to get her own son Harthacnut preferred to him. In Denmark the younger claimant was acknowledged by the whole people, but in England the Mercian and Northumbrian ears chose Harold as king, and Wessex only fell to Harthacnut. Both the young kings were cruel, dissolute and wayward, most unworthy sons of a wise father. It was to the great profit of England that they died within two years of each other, the elder in 1040, the younger in 1042.

On Harthacnut's death he was succeeded not by any Danish prince but by his half-brother Edward, the eldest son of Æthelred and Emma, whom he had entertained at his court, and had apparently designated as his heir, for he had no offspring. There was an end of the empire of Canute, for Denmark fell to the great king's nephew, Sweyn Estrithson, and Norway had thrown off the Danish yoke. Engaged in wars with each other, Dane and Norseman had no leisure to think of reconquering England. Hence Edward's accession took place without any friction. He reigned, but did not rule, for twenty-four years, though he was well on in middle age before he was crowned. Of all the descendants of Alfred he was the only one who lived to see his sixtieth birthday—the house of Wessex were a short-lived race. In character he differed from all his ancestors—he had Alfred's piety without his capacity, and Æthelred's weakness without his vices. The mildest of men, a crowned monk, who let slip the reins of government from his hands while he busied himself in prayer and church building; he lowered the kingly power to a depth to which it had never sunk before in England. His sole positive quality lived and3000, was a love for his mother's kin, the Normans. He had spent his whole life from 1013 to 1040 as an exile at the court of Rouen, and was far more of a Norman than an Englishman. It was but natural, therefore, that he should invite his continental relatives and the friends of his youth to share in his late-coming prosperity. But when he filled his court with them, made them ears and bishops, and appointed one of them, Robert of Jumièges, to the archbishopric of Canterbury, his undisguised preference for strangers gave no small offence to his English subjects. In the main, however, the king's personal likes and dislikes mattered little to the realm, since he had a comparatively small share in its governance. He was habitually overruled and dominated by his ears, of whom three, Leofric, Godwine and Siward—all old servants of Canute—had far more power than their master. Holding respectively the great earldoms of West Mercia, Wessex and Northumbria, they reigned almost like petty sovereigns on the three great tracts of the island, and under their influence England might fall apart into semi-independent feudal states, just as France had done in the preceding century. The rivalries and intrigues of these three magnates constitute the main part of the domestic politics of Edward's reign. Godwine, whose

Harold. daughter had wedded the king, was the most formidable and ambitious of the three, but his pre-eminence provoked a general league against him and in 1051 he was cast out of the kingdom with his sons. In the next year he returned in arms, raised Wessex in revolt, and compelled the king to in-law him again, to restore his earldom, and to dismiss with ignominy the Norman favourites who were hunted over seas. The old earl died in 1053, but was succeeded in power by his son Harold, who for thirteen years maintained an unbroken mastery over the king, and ruled England almost with the power of a regent. There seems little doubt that he aspired to be Edward's successor: there was no direct heir to the crown, and the nearest of kin was an infant, Edgar, the great-nephew of the reigning sovereign and grandson of Edmund Ironside. England's experience of minors on the throne had been unhappy—Edwy and Æthelred the Redless were warning rather than examples. Moreover Harold had before his eye as a precedent the displacement of the effete Carolingian line in France, by the new house of Robert the Strong and Hugh Capet, seventy years before. He prepared for the crisis that must come at the death of Edward the Conessor by bestowing the governance of several earldoms upon his brothers. Unfortunately for him, however, the eldest of them, Tostig, proved the greatest hindrance to his plans, provoking wrath and opposition wherever he went by his highhandedness and cruelty.

Harold's governance of the realm seems to have been on the whole successful. He put down the Scottish usurper Macbeth with the swords of a Northumbrian army, and restored Malcolm III. to the throne of that kingdom (1055-1058). He led an army into the heart of Wales to punish the raids of King Griffith ap Llewelyn, and harried the Welsh so bitterly that they put their leader to death, and renewed their homage to the English crown (1063). He won enthusiastic devotion from the men of Wessex, of whom Loewis and Æthelwold, but in Northumbria and Mercia he was less liked. His experiment in taking the rule of these earldoms out of the hands of the descendants of Siward and Leofric proved so unsuccessful that he had to resign himself to undoing it. Ultimately one of Leofric's grandsons, Edwyn, was left as earl of Mercia, and the other, Morcar, became earl of Northumbria instead of Harold's unpopular brother Tostig. It was on this fact that the fortune of England was to turn, for in the hour of crisis Harold was to be betrayed by the lords of the Midlands and the North.

Somewhere about the end of his period of ascendancy, perhaps in 1064, Harold was sailing in the Channel when his ship was driven ashore by a tempest near the mouth of the Somme. He fell into the hands of William the Bastard, duke of Normandy, King Edward's cousin and best-loved relative. The duke brought him to Rouen, and kept him in a kind of honourable captivity till he had extorted a strange pledge from him. William alleged that his cousin had promised to make him his heir, and to recommend him to the witan as king of England. He demanded that Harold should swear to aid him in the project. Fearing for his personal safety, the earl gave the required oath, and sailed home a perjured man, for he had assuredly no intention of keeping the promise that had been extorted from him. Within two years King Edward expired (Jan. 5, 1066) after having recommended Harold as his successor to the thegns and bishops who stood about his deathbed. The witan chose the earl as king without any show of doubt, though the assent of the Mercian and Northumbrian ears must have been half-hearted. Not a word was said in favour of the claim of the child Edgar, the heir of the house of Alfred, nothing (of course) for the preposterous claim of William of Normandy. Harold accepted the crown without a moment's hesitation, and at once prepared to defend it, for he was aware that the Norman would fight to gain his purpose. He at once married Ealdgyth and Morcar by marrying their sister Ealdgyth, and announced that he would be their loyal support. When the spring came round it was known that William had begun to collect a great fleet and army. Aware that the resources of his own duchy were inadequate to the conquest of England, he sent all over Europe to hire mercenaries, promising every knight who would join him broad lands beyond the Channel in the event of victory. He gathered beneath his banner thousands of adventurers not only from France, Brittany and Flanders, but even from distant regions such as Aragon, Apulia and Germany. The native Normans were but a third part of his host, and he himself commanded rather as director of a great joint-stock venture than as the feudal chief of his own duchy. He also obtained the blessing of Pope Alexander II. for his enterprise, partly on the plea that Harold was a perjurer, partly because Stigand, the archbishop of Canterbury, had acknowledged the late anti-pope Benedict.

All through the summer Harold held a fleet concentrated
under the lee of the Isle of Wight, waiting to intercept William’s
armament, while the fyrd of Wessex was ready to support him
if the enemy should succeed in making a landing. By September
the provisions were spent, and the ships were growing une-
worthy. Very reluctantly the king bade them go round to
London to refit and revictual themselves. William meanwhile
had been unable to sail, because for many weeks the wind had
been unfavourable. If it had set from the south the fortune of
England would have been settled by a sea-fight. At this moment
came a sudden and incalculable diversion; Harold’s turbulent
brother Tostig, banished for his crimes in 1065, was seeking
revenge. He had persuaded Harold Hardrada, king of Norway,
almost the last of the great viking adventurers, to take him as
guide for a raid on England. They ran into the Humber with
a great fleet, beat the earls Edwin and Morcar in battle, and
captured York. Abandoning his watch on the south coast Harold
of England fled northward to meet the invaders; he surprised
them at Stamford Bridge, slew both the Norse king and the
rebel earl, and almost exterminated their army (Sept. 25 1066).
But while he was absent from the Channel the wind turned,
and William of Normandy put to sea. The English fleet and the
English army were both absent, and the Normans came safely
to shore on the 28th of September. Harold had to turn hastily
southward to meet them. On the 13th of October his host was
arrayed on the hill of Senlac, 7 miles from the town of
Hastings. The ranks of his knighthood and house-carles had been
thinned by the slaughter of Stamford Bridge, and their place
was but indifferently supplied by the hasty levies of London, Wessex
and the Home Counties. Edwin and Morcar, who should have
been at his side with their Mercians and Northumbrians, were
still far away—perhaps from treachery, slackness and jealousy.
Next morning (October 14) William marched out from Hastings
and attacked the English host, which stood at bay in a solid
mass of spear and axemen behind a slight breastwork on the
hillside. After six hours of desperate fighting the victory fell
to the duke, who skillfully alternated the use of archers and
cavalry against the unwieldy English phalanx. (See Hastings:
Battle of.) The disaster was complete, Harold himself was
slain, his two brothers had fallen with him, not even the wreck
of an army escaped. There was no one to rally the English in
the name of the house of Godwine. The witan met and hastily
saluted the child Edgar Etheling as king. But the earls Edwin
and Morcar refused to fight for him, and when William appeared
in front of the gates of London they were opened almost
without resistance. He was elected king in the old English
fashion by the surviving magnates, and crowned on Christmas
Day 1066.

II. The Norman and Angevin Monarchy (1066-1199)

When William of Normandy was crowned at Westminster by
Archbishop Aldred of York and acknowledged as king by the
witan, it is certain that few Englishmen understood the
full importance of the occasion. It is probable that most men recalled the election of Canute, and
supposed that the accession of the one alien sovereign
would have no more permanent effect on the realm than that of
the other. The rule of the Danish king and his two short-lived
sons had caused no break in the social or constitutional history of
England. Canute had become an Englishman, had accepted
all the old institutions of the nation, had dismissed his host of
vikings, and had ruled like a native king and for the most part
with native ministers. Within twenty years of his accession the
disasters and calamities which had preceded his triumph had
been forgotten, and the national life was running quietly in its
old channels. But the accession of William the Bastard meant
something very different. Canute had been an impressionable
lad of twenty or nineteen when he was crowned; he was ready
and eager to learn and to forget. He had found himself con-
fronted in England with a higher civilization and a more ad-
vanced social organization than those which he had known in
his boyhood, and he accepted them with alacrity, feeling that he
was thereby getting advantage. With William the Norman
all was different: he was a man well on in middle age, too old
to adapt himself easily to new surroundings, even if he had been
willing to do so. He never even learnt the language of his
English subjects, the first step to comprehending their needs and
their views. Moreover, unlike his Danish predecessor, he
looked down upon the English from the plane of a higher civiliza-
tion; the Normans regarded the conquered nation as barbarous
and boorish. The difference in customs and culture between the
dwellers on the two sides of the Channel was sufficient to make
this possible; though it is hard to discern any adequate justifi-
cation for the Norman attitude. Probably the bar of language
was the most prominent cause of estrangement. In five genera-
tions the viking settlers of Normandy had not only completely
forgotten their old Scandinavian tongue, but had come to look
upon those who spoke the kindred English idiom not only as
aliens but as inferiors. For three centuries French remained the
court speech, and the mark of civilization and gentility.

Despite all this the Conquest would not have had its actual
results if William, like Canute, had been able to dismiss his
conquering army, and to refrain from a general policy of
Progress of Conquest; of Norman Settlement.
great Domesday survey, made nearly twenty years later, shows the greater part of Yorkshire as "waste." This act was exceptional only in its extent: the king was as cruel on a smaller scale elsewhere, and not contented with the liberal use of the axe and the rope was wont to inflict his favourite punishments of blinding and mutilation on a most reckless scale.

The net result of the king's revenge on the rebellious English was that by 1075 the old governing class had almost entirely disappeared, and that their lands, from the Channel to the Tweed, had everywhere been distributed to new holders. To a great extent the same horse of continental adventurers who had obtained the first batch of grants in Wessex and Kent were also the recipients of the later confiscations, so that their newly acquired estates were scattered all over England. Many of them came to own land in ten or a dozen counties remote from each other, a fact which was of the greatest importance in determining the character of English feudalism. While abroad the great vassals of the crown generally held their property in compact blocks, in England their power was weakened by the dispersion of their lands. This tendency was assisted by the fact that even when the king, as was his custom, transferred to a Norman the estates of an English landowner just as they stood, those estates were already for the most part not conterminous. Even before the Conquest the lands of the magnates were to a large extent held in scattered units, not in solid patches. Only in two cases did William establish lordships of compact strength, and these were created for the special purpose of guarding the turbulent Welsh March. The "palatine" earls of Chester and Shrewsbury were not only endowed with special powers and rights of jurisdiction, but were almost the only tenants-in-chief within their respective shires. These rare exceptions prove the general rule: William probably foresaw the dangers of such accumulation of territory in private hands. He made a complete end of the old English system by which great earls ruled many shires: there were to be no Godwines or Leofricst under the Norman rule. This particular feudal danger was avoided: where earls were created, and they were but few, their authority was usually restricted to a single shire.

It remains to speak of the most important change which William's rearrangements made in the polity of England. It was of course untrue to say—as was so often done by early historians—that he "introduced the feudal system into England." In some aspects feudalism was already in the land before he arrived: in others it may be said that it was never introduced at all. He did not introduce the practice by which the small man commended himself to the great man, and in return for his protection divested himself of the full ownership of his own land, and became a customary tenant in what later ages called a "manor." That system was already in full operation in England before the Conquest. In some districts the wholly free small landowner had already disappeared, though in the regions which had formed the Dane-lag he was still to be found in numbers. But William, by the system of great earldoms, passing from father to son, which gave over-great subjects a hereditary grip on the countryside. On the contrary, as has been already said, he did much to check that tendency, which had already developed in England.

What he really did do was to reconstruct society on the essentially feudal theory that the land was a gift from the king, held on conditions of homage and military service. The duties which under the old system were national obligations resting on the individual as a citizen, he made into duties depending on the relation between the king as supreme landowner and the subject as tenant of the land. Military service and the paying of the feudal taxes—aid, relief, &c.—are incidents of the bargain between the crown and the grantees to whom land has been given. That grantee, the tenant-in-chief, has the right to demand from his sub-tenants, to whom he has given out fractions of his estate, the same dues that the king exacts from himself. As at least four-fifths of the land of England had fallen into the king's hands between 1066 and 1074, and had been actually regranted to new owners—foreigners to whom the feudal system was the only conceivable organization of political existence—the change was not only easy but natural. The decline of English landholders had to fall into line with the newcomers. England, in short, was reorganized into a state of the continental type, but one differing from France or Germany in that the crown had not lost so many of its regularities as abroad, and that even the greater earls had less power than the ordinary continental tenant-in-chief.

The English people became aware of this transformation in the "theory of the state" mainly through the fact that the new tenants-in-chief, bringing with them the ideas in which they had been reared, failed to comprehend the rather complicated status of the rural population on this side of the Channel. To the French or Norman knight all peasants on his manor seemed to be villeins, and he failed to understand the distinction between freemen who had personally commended themselves to his English predecessor but still owned their land, and the mass of ordinary servile tenants. There can be no doubt that the first effect of the Conquest was that the upper strata of the agricultural classes lost the comparative independence which they had hitherto enjoyed, and were in many cases depressed to the level of their inferiors. The number of freemen began to decrease, from the encroachments of the landowner, and continued to dwindle for many years: even in districts where Domesday Book shows them surviving in considerable numbers, it is clear that a generation or two later they had largely disappeared, and became merged in the villein class.

In this sense, therefore, England was turned into a feudal state by the results of the work of William the Conqueror. But it would be wrong to assert that all traces of the ancient social organization of the realm were swept away. The old Saxon customs were not forgotten, though they might in many cases be twisted to fit new surroundings. Indeed William and his successors not infrequently caused them to be collected and put on record. The familiar Domesday Book (canonically, and in its essence not a new institution) records the state of England at the moment of the Conquest, compiled in order that the king may have a full knowledge of the rights that he possesses as the heir of King Edward. Being primarily intended to facilitate the levy of taxation, it dwells more on the details of the actual wealth and resources of the country in 1066 and 1086, and less on the laws and customs that governed the distribution of that wealth, than could have been wished. But it is nevertheless a monument of the permanence of the old English institutions, even after the ownership of four-fifths of the soil has been changed. The king inquires into the state of things in 1066 because it is on that state of things that his rights of taxation depend. He does not claim to have rearranged the whole realm on a new basis, or to be levying his revenue on a new assessment made at his own pleasure. Nor is it in the sphere of taxation alone that William's organization of the realm stands on the old foundation.

In the military sphere, though his normal army is the feudal force of the great earls and the knights whom they have enfeofled, he retains the power to call out the fyrd, the old national leade en masse, without regard to whether its members are freemen or villeins of some lord. And in judicial matters the higher rights of royal justice remain intact, except in the few cases where special privileges have been granted to one or two palatine earls. The villein must sue in his lord's manorial courts, but he is also subject to the royal courts of hundred and shire. The machinery of the local courts survives for the most part intact.

William's dealings with the Church of England were no less important than his dealings with social organization. In the earlier years of his reign he set himself to get rid of the whole of the upper hierarchy, in order to replace them by Normans. In 1070 Archbishop Stigand was deposed as having been uncanonically chosen, and six or seven other bishops after him. All the vacancies, as well as those which kept occurring during the next few years, were immediately filled up with foreigners. By the time that William
had been ten years on the throne there were only three English bishops left. At his death there was only one—the saintly Wulfstan of Worcester. The same process was carried out with regard to abbacies, and indeed with all important places of ecclesiastical preferment. By 1085 the English Church was offi
cially not entirely by aliens. Just as with the lay landholders, the change of personnel made a vast difference, not so much in the legal position of the new-comers as in the way in which they regarded their office. The outlook of a Norman bishop was as unlike that of his English predecessor as that of a Norman baron. The English Church had got out of touch with the ideals and the spiritual movements of the other Western churches. In especial the great monastic revival which had started from the abbey of Cluny and spread all over France, Italy and Germany had hardly touched this island. The continental churchmen of the 11th century were brimming over with ascetic zeal and militant energy, while the majority of the English hierarchy were slack and easy-going. The typical faults of the dark ages, pluralism, simony, lax observation of the clerical rules, tolerated ignorance, worldliness in every aspect, were all too prevalent in England. There can be no doubt that the greater part of William's nominees were better men than those who preceded them; his great archbishop, Lanfranc, though a busy statesman, was also an energetic reformer and a man of holy life. Osmund, Remigius and others of the first post-Conquest bishops were in some respects better men than those who preceded them, though the effect of the church alike in the matter of spiritual zeal, of hard work and of learning was much improved. But there was a danger behind this revival; for the reformers of the 11th century, in their zeal for establishing the Kingdom of God on earth, were not content with raising the moral and intellectual standards prevailing in Christendom, but sought to bring the whole scheme of life under the church, by asserting the absolute supremacy of the spiritual over the temporal power, wherever the two came in contact or overlapped. The result, since the feudal and ecclesiastical systems had become closely interwoven, and the frontier between the religious and secular spheres must ever be vague and undefined, was the conflict between the spiritual and temporal powers which, for two centuries to come, was to tear Europe into warring factions (see the articles CHURCH HISTORY; PAPACY; INVESTITURE). The Norman Conquest of England was contemporaneous with the suprime influence of the greatest exponent of the theory of ecclesiastical supremacy, the archiepiscopal Hildebrand, who in 1073 mounted the papal throne as Gregory VII. (q.v.). William was no less than his successor, though his relations with the temporal powers were more cordial. He had acquiesced in the new developments of the religious reformation which he had done his best to forward. Hence we find a divided purpose in the policy which he pursued with regard to church affairs. He endeavoured to keep on the best terms with the papacy: he welcomed legates and frequently consulted the pope on purely spiritual matters. He even took the hazardous step of separating ecclesiastical courts and lay courts, giving the church leave to establish separate tribunals of her own, a right which she had never possessed in Saxon England. The spiritual jurisdiction of the bishop had hitherto been exercised in the ordinary national courts, with lay assessors frequently taking part in the proceedings, and mixing their dooms with the clergy's canonical decisions. William in 1076 granted the church a completely independent set of courts, a step which his successors were to regret for many a generation.

At the same time, however, he was not blind to the possibilities of papal interference in domestic matters, and of the danger of conflict between the temporal and ecclesiastical powers. To guard against them he laid down three general rules: (1) that no one should be recognized as pope in England till he had himself taken cognizance of the papal election, and that no papal letters should be brought into the realm without his leave; (2) that no decisions of the English ecclesiastical synods should be held valid till he had examined and sanctioned them; (3) that none of his barons or ministers should be communicated unless he approved of such punishment being inflicted on them. These rules seem to have argued a deeply rooted distrust of the possible encroachments of the papacy on the power of the state. The question of ecclesiastic patronage, which was to be the source of the first great quarrel between the crown and the church in the next generation, is not touched upon. William retained in his own hands the choice of bishops and abbots, and Alexander II. and Gregory VII. seem to have made no objection to his doing so, in spite of the claim that free election was the only canonical way of filling vacancies. The Conqueror was allowed for his lifetime to do as he pleased, since he was recognized as a true friend of the church. But the question was only deferred and not settled.

The political history of William's later years is unimportant; his main energy was absorbed in the task of holding down and organizing his new kingdom. His rather precarious conquest of the county of Maine, his long quarrels with Philip I. of France, who suborned against him his undutiful and rebellious eldest son Robert, his negotiation with Flanders and Germany, deserve no more than a mention. It is more necessary to point out that he reasserted on at least one occasion (when King Malcolm Canmore did him homage) the old suzerainty of the English kings over Scotland. He also began that encroachment on the borders of Wales which was to continue with small interruptions for the next two centuries. The advance was begun by the great wars in the early years of Chester, Shrewsbury and Hereford, all of whom occupied new districts on the edge of the mountains of Powys and Gwynedd. William himself led an expedition as far as St. Davids in 1081, and founded Cardiff Castle to mark the boundary of his realm north of the Bristol Channel.

Perhaps the most noteworthy event of the second portion of the Conqueror's reign was a rebellion which, though it made no head and was easily suppressed, marks the commencement of that feudal danger which was to be the constant trouble of the English kings for the next three generations. Two of the greatest of his foreign magnates, Roger, earl of Hereford, and Ralph, earl of Norfolk, rose against him in 1075, with no better cause than personal grievances and ambitions. They put them down with ease; the one was imprisoned for life, the other driven into exile, while Waltheof, the last of the English earls, who had dabbled in a hesitating way in this plot, was executed. There was never any serious danger, but the fact that under the new régime baronial rebellion was possible, despite of all William's advantages, marks us a stage in the development of feudalism, which was hardly yet formed, and was to become a sinister import for the future of England. With the new monarchy there had come into England the anarchic spirit of continental feudalism. If such a man as the Conqueror did not overawe it, what was to be expected in the reigns of his successors? William had introduced into his new realm alike the barons, with their personal ambition, and the clerics of the school of Hildebrand, with their intense jealousy for the rights of the church. The tale of the dealings of his descendants with these two classes of opponents constitutes the greater part of English history for a full century.

William Rufus. William died at Rouen on the 7th of September 1087; on his death-bed he expressed his wish that Normandy should pass to his elder son, Robert, in spite of all his rebellions, but gave his second son William (known by the nickname of Rufus) the crown of England, and sent him thither with communicatory letters to archbishop Lanfranc and his other ministers. There was at first no sign of opposition to the will of the late king, and William Rufus was crowned within three weeks of his father's decease. But the results of the Conquest had made it hard to tear England and Normandy apart. Almost every baron in the duchy was now the possessor of a smaller or a greater grant of lands in the kingdom, and the possibility of serving two masters was as small in 1087 as at any other period of the world's history. By dividing his two states between his sons the Conqueror undid his own work, and left to his subjects the certainty of civil war. For the brothers Robert and William were, and always had been, enemies, and
ever intriguing baron had before him the tempting prospect of aggrandizing himself, by making his allegiance to one of the brothers serve as an excuse for betraying the other. Robert was thrifty, volatile and easy-going, a good knight but a most incompetent sovereign. These very facts commended him to the more turbulent section of the baronage; if he succeeded to the whole of the Conqueror's heritage they would have every opportunity of enjoying freedom from all governance. William's private character was detestable: he was cruel, lascivious, greedy of gain, a habitual breaker of oaths and promises, ungrateful and irreligious. But he was cunning, strong-handed and energetic; clearly the "Red King" would be an undesirable master to those who loved feudal anarchy. Hence every turbulent baron in England soon came to the conclusion that Robert was the sovereign whom his heart desired.

The greater part of the reign of William II. was taken up with his fight against the feudal danger. Before he had been six months on the throne he was attacked by a league comprising more than half the baronage, and headed by his uncles, bishop Odo of Bayeux and Robert of Mortain. They used the name of the duke of Normandy and had secured his promise to cross the Channel for their assistance. A less capable and unscrupulous king than Rufus might have been swept away, for the rising heresy of bad kings was not the only strength of the realm. But he made head against it with the aid of mercenary bands, the loyal minority of the barons, and the shire-levies of his English subjects. When he summoned out the fyrd they came in great force to his aid, not so much because they trusted in the promises of good governance and reduced taxation which he made, but because they saw that a horde of greedy barons would be worse to serve than a single king, however hard and selfish he might be. With their assistance William fought down the rebels, expelled his uncle Odo and several other leaders from the realm, confiscated a certain amount of estates, and then pardoned the remainder of the rebels. Such mercy, as he was to discover, was misplaced. In 1095 the same body of barons made a second and a more formidable rising, headed by the earls of Shrewsbury, Eu and Northumberland. It was put down with the same decisive energy that William had shown in 1088, and this time he was merciless; he blinded and mutilated William of Eu, shut up Mowbray of Northumberland for life in a monastery, and hanged many men of lesser rank. Of the other rebels some were made bishops and abbots in England, and others were allowed to part of them after paying crushing fines. This second feudal rebellion was only a distraction to William from his war with his brother Robert, which continued intermittently all through the earlier years of his reign. It was raging from 1088 to 1091, and again from 1093 to 1096, when Robert tired of the losing game, pawned his duchy to his brother and went off on the First Crusade. Down to this moment William's position had been somewhat precarious; with the Norman war generally on hand, feudal rebellion always imminent, and Scottish invasions occasionally to be repelled, he had no easy life. But he fought through his troubles, conquered Cumberland from the Scots (1092), in dealing with his domestic enemies used cunning where force failed, and generally got his will in the end. His rule was expensive, and he made himself hated by every class of his subjects, baronage, clergy and people alike, by his ingenuous and oppressive taxation. His chosen instrument, a clerical lawyer named Ranulf Flambard (q.v.), whom he presently made bishop of Durham, was shameless in his methods of seizing feudal or national law to the detriment of the king. William supported him in every device, however unjust, with a cynical frankness which was the distinguishing trait of his character; for he loved to display openly all the vices and meannesses which most men take care to disguise. In dealing with the baronage Ranulf and his master extorted excessive and arbitrary "reliefs" whenever land passed in succession to heirs. When the church was a landholder their conduct was even more unwarrantable; every clerk installed in a new preceptory was forced to pay a large sum down—which in that age was considered a clear case of simony by all conscientious men. But in addition the king kept all wealthy posts, such as bishoprics and abbacies, vacant for years at a time and appropriated the revenue meanwhile.

This policy, when pursued with regard to the archbishopric of Canterbury, brought on Rufus the most triumphant of his quarrels. When the wise primate Lanfranc, his father's friend, died in 1086, he made no appointment till 1093, extracting meanwhile great plunder from the see. In a moment of sickness, when his conscience was for a space troubling him or his will was weak, he nominated the saintly Anselm (q.v.) to the archbishopric. When enthroned the new primate refused to make the enormous gift which the king expected from every recipient of prebend. Soon after he began to press for leave to hold a national synod, and when it was denied him, spoke out boldly on the personal vices as well as the immoral policy of the king. From this time William and Anselm became open enemies. They fought first upon the question of acknowledging Urban II. as pope—for the king, taking advantage of the fact that there was an antipope in existence, refused to allow that there was any certain and legitimate head of the Western church at the moment. Then, after William had reluctantly yielded on this point, the far more important question of lay investitures cropped up. The council of Clermont (Nov. 1095) had just issued its famous decree to the effect that bishops must be chosen freely by the clergy, not by the king. William, who was invested with their episcopal insignia, then put an end to this gift of benefices or enfeoffed with their estates by the hands of a secular prince. Anselm felt himself obliged to accept this decision, and refused to accept his own pallium from William when Urban sent it across the sea by the hands of a legate. The king replied by harrying him on charges of having failed in his feudal obligation to provide well-equipped knights for a Welsh expedition, and imposed ruinous fines on him. It was even said that his life was threatened, and he fled to Rome in 1097, not to return till his adversary was dead. There was much to be said for the theory of the king as to the relations between church and state; he was indeed only carrying on in a harsh form his father's old policy. But the fact that he was a tyrant and an evil-liver, while Anselm was a saint, so much influenced public opinion that William was universally regarded as in the wrong, and the sympathy of the laity no less than the clergy was with the archbishop. For the remaining three years of his life the Red King was considered to be in a state of repudiation and at open strife with righteousness. Yet so far as secular affairs went William seemed prosperous enough. Since his brother Robert had lost his life he was the most powerful man in England, and there appeared to be no reason why he should not reign on in his place. But on the 2nd of August 1097 he was suddenly cut off in the midst of his sins. While hunting with some of his godless companions in the New Forest, he was struck by an arrow, unskilfully shot by one of the party. The knight Walter Tyrrell, who was persistently accused of being the author of his master's death, as persistently denied his responsibility for it; and whether the arrow was his or no, it was not alleged that malice guided it. William's favourites had all to lose by his death.

The king's death was not expected: he was only in his fortieth year, and men's minds had not even begun to ponder over the question of who would succeed him. The crown of England was left vacant for the boldest kinsman to snatch at, if he dared. William had two surviving brothers, beside several nephews. Robert's claim seemed the more likely to succeed, for not only was he the elder, but England was full of barons who desired his accession, and had already taken up arms for him in 1087 or 1095. But he was far away—being at the moment on his return journey from Jerusalem—while on the spot was his brother Henry, an ambitious
This minor official nobility was the strength of the crown, and was sharply divided in spirit and ambition from the older feudal aristocracy which descended from the original adventurers who had followed William the Conqueror. Yet the latter still remained strong enough to constitute a danger to the crown whenever it should fall to a king less wary and resolute than Henry himself.

Henry was by nature more of an administrator and organizer than of a fighting man. He was a competent soldier, but his wish was rather to be a strong king at home than a great conqueror abroad. Nevertheless he was driven by the logic of events to attack Normandy, for as long as his brother reigned there, and as long as many English barons retained great holdings on both sides of the Channel and were subjects of the duke as well as of the king, intrigues and plots never ceased. The Norman war ended in the battle of Tenchebrai (Sept. 28, 1106), where Duke Robert was taken prisoner. His brother shut him up in honourable confinement for the rest of his life, though otherwise he was not ill-treated. For the rest of his reign Henry was ruler of all the old dominions of the Conqueror, and none of his subjects could claim disloyalty by the pretence of owning a divided allegiance to the English crown. With his crown thus secured, and made no great effort to extend his dominions farther; his desire was to reign a true king in England and Normandy, rather than to build up a loosely compacted empire around them.

Throughout the time of Henry's Norman war, he was engaged in a tiresome controversy with the primate on the question of lay investitures, the continuation of the struggle which had begun in his brother's reign. Every English king for five generations had to face the danger from the church, no less than the danger from the barons. Anselm had come back from Rome confirmed in the theories for which he had contended with Rufus—nay, taught to extend them to a further extreme. He now maintained not only that it was a sin that kings should invest prelates with their spiritual insignia, the pallium, the staff, the ring, but claimed that no clerk ought to do homage to the king for the lands of his benefice, though he himself seven years before had not scrupled to make his oath to his earlier master. He now refused to swear allegiance to the new monarch, though he had recalled him and had restored him to the possession of his see. He also refused to consecrate Henry's nominees to certain bishoprics and abbacies on the ground that they had not been chosen by free election by their chapters or their monks. The king was loath to take up the quarrel, for he highly respected the archbishop; yet he was still more loath to surrender the ancient claims and privileges of the crown. Anselm was equally reluctant to force matters to an open breach, yet would not shift from his position. There followed an interminable series of arguments, interrupted by truces, till at last Anselm, at the king's suggestion, went to Rome to see if the pope could arrange some modus vivendi. Paschal II. for some time refused to withdraw from his fixed theory of the relation of church and state, and Anselm, in despair, preferred to remain abroad rather than to press matters to the rupture that seemed the only logical issue of the controversy. But in 1107 the pope consented to a compromise, which satisfied the king, and left the cathedral churches and abbeys of the realm intact. The church was thus saved from the spectre of a new civil war; but the king, recognizing his mistake, ordered the abbots and abbes for the future to be canonically elected by the clergy, and no longer to receive the ring and staff from lay hands. But they were loath to do homage to the king for their lands, and since they thus acknowledged him as their temporal lord Henry was content. Moreover, he retained in practice, if not in theory, his power to nominate to the vacant offices; chapters and monasteries seldom dared to resist the pressure which the sovereign could bring to bear upon them in favour of the candidate whom he had selected. The arrangement was satisfactory, and served as the model for the similar compromise arrived at between Pope Callixtus II. and the emperor Henry V. fifteen years later.

From 1107 onward Henry was freed from both the dangers which had threatened him in his earlier years, and was free to develop his policy as he pleased. He had yet twenty-eight years to reign, for he survived to the age of sixty-seven, an age...
unparalleled by any of his predecessors, and by all his successors till Edward I.

It is to Henry, aided by his great justiciar, Roger, bishop of Salisbury, that England owed the institution of the machinery of government by which it was to be ruled during the earlier middle ages. This may be described as a primitive kind of bureaucracy, which gradually developed into a much more complicated system of courts and offices. Around the sovereign was his Curia Regis or body of councilors, of whom the most important were the justiciar, the chancellor and the treasurer, though the feudal officers, the constable and marshal, were also to be found there. The bulk of the council, however, was composed of knights and clerks selected by the king for their administrative or financial ability. The Curia, besides advising the king on ordinary matters of state, had two special functions. It sat, or certain members of it sat, under the presidency of the king or the justiciar, as the supreme court of justice of the realm. In this capacity it tried the suits of tenants-in-chief, and all appeals from the local courts. But Henry, not contented with this, adopted the custom of sending forth certain members of the Curia throughout the realm at intervals, to sit in the shire court, along with or in place of the sheriff, and to hear and judge all the cases of which the court had cognizance. From these itinerant commissioners (justices in eyre) descend the modern justices of assize. The sheriff, the original president of the shire court, was gradually extruded by them from all important business.

But there were other developments of the Curia. The justiciar, chancellor and treasurer sat with certain other members of the council as the court of exchequer, not only to receive and audit the accounts of the royal revenue, but to give legal decisions on all questions connected with finance. Twice in every year the sheriffs and other royal officials came up to the exchequer court, which originally sat at Winchester, with their bags of money and their shaves of accounts. Their figures were subjected to a severe scrutiny, and the law was laid down on all points in which the interests of the sheriff and the king, or the sheriff and the taxpayer, came into conflict. In this way the exchequer grew into a law court of primary importance, instead of remaining merely a court of receipt. Though its members were originally the same men who sat in the Curia Regis, the character of the question to be tried settled the capacity in which they should sit, and two separate courts were evolved. (See EXCHEQUER.)

Under the superintendence of the Curia Regis and the exchequer, the sheriff still remained the king's factotum in local affairs. He led the shire-levis, collected the royal revenues both feudal and non-feudal, and presided in the shire-court as judge, till in the course of years his functions in that sphere were gradually taken over by the itinerant justices. On his fidelity the king had to rely both for military aid in times of baronial revolt and for the collection of the money which formed the sinews of war. Hence the position was one of the highest importance, and Henry's new nobility, the men of ability whom he selected and promoted, found their special occupation in holding the office of sheriff. It was they who had to see that the shire court, and in minor affairs the hundred court, did not allow cases to slip away into the jurisdiction of the feudal courts of the barony.

Henry I. must count not merely as the father of the English bureaucracy, but as a founder of the municipal independence of the towns. He gave charters of a very liberal character to many places, and in especial to London, where the citizens were allowed to choose their own sheriff, and to deal directly with the exchequer in matters of revenue. He even farmed out to them the charge of the taxes of the whole shire of Middlesex, outside the city walls. Such a grant was exceptional—though Lincoln also seems to have been granted the privilege of dealing directly with the exchequer. But in many other smaller towns the first grants —the smaller beginnings of autonomy—may be traced back to this period (see BOROUGH).

Though Henry was an autocrat, and governed through bureaucratic officials who were entirely under his hand, yet a reign of law and order such as his was indirectly favourable to the growth of constitutional liberty. It was equally favourable to the growth of national unity: it was in his time that Norman and English began to melt together: intermarriage in all classes became common, and only thirty years after his death a contemporary writer could remark that it was hard for any man to call himself either Norman or English, so much had blood been intermingled.

It is unnecessary to go into the very uninteresting and unimportant history of Henry's later years. A long war with France, prosecuted without much energy, led to no results, for the French king's attempts to stir up rebellions in the name of William the Clito (q.v.), the son of Duke Robert, came to an end with that prince's death in 1129. But the extension of the English borders in South Wales by the conquests of the lords marcher as far as Pembroke and Cardigan deserves a word of notice.

The question of the succession was the main thing which occupied the mind of the king and the whole nation in Henry's later years. It had a real interest for every man in an age when any doubt as to the heir meant the outbreak of civil war such as had occurred at the death of the Conqueror and of Rufus. There was now a problem of some difficulty to be solved. Henry's only son William had been drowned at sea in 1120. He had no other child born in wedlock save a daughter, Matilda, who married the emperor Henry V., but had no issue by him. On the emperor's decease she wedded as her second husband Geoffrey of Anjou (1127), to whom during her father's last years she bore two sons. But the succession of a woman to the crown was as unfamiliar to English as to Norman ideas, nor did it seem natural to either to place a young child on the throne. Moreover, Matilda's husband Geoffrey was unpopular among the Normans; the Angevins had been the chief enemies of the duchy for several generations, and the idea that one of them might become its practical ruler was deeply resented. The old king, as was but natural, had determined that his successor should be his successor; he made the great council do homage to her in 1126, and always kept her before the eyes of his people as his destined heir. But though he had forced or cajoled every leading man in England and Normandy to take his oath to serve her, he must have been conscious that there was a large chance that such pledges would be forgotten at his death. The prejudice against a female heir was strong, and there were too many turbulent magnates to whom the anarchy which would follow a disputed succession presented temptations which could not be resisted.

Henry died suddenly on the 25th of November 1135, while he was on a visit to his duchy of Normandy. The moment that his death was reported the futility of oaths became apparent. A majority of the Norman barons appealed to Theobald, count of Blois, son of the Conqueror's daughter Adela, to be their duke, and to save them from the yoke of the hated Angevin. His supporters and those of Matilda were soon at blows all along the frontier of Normandy. Meanwhile in England another pretender had appeared. Stephen, count of Boulogne, the youngest brother of Theobald, had landed at Dover within a few days of Henry's death, determined to make a snatch at the crown, though he had been one of the first who had taken the oath to his cousin a few years before. The citizens of London welcomed him, but he was not secure of his success till by a swift swoop on Winchester he obtained possession of the royal treasure—an all-important factor in a crisis, as Henry I. had shown in 1100. At Winchester he was acknowledged as king by the bishop, his own brother Henry of Blois, and by the great justiciar, Roger, bishop of Salisbury, and the archbishop, William of Corbeil. The allegiance of these prelates was bought by an unwise promise to grant all the demands of the church party, which his predecessor had denied, or conceded only in part. He would permit free election to all benefices, and free legislation by ecclesiastical synods, and would surrender all claims of the royal courts to ...
have jurisdiction over clerks or the property of clerks. It then remained necessary to buy the baronage, of which only a few members had as yet committed themselves to Matilda. It was done by grants of lands and privileges, the first instalment of a never-ending crop of ruinous concessions which Stephen continued to make from the day of his accession down to the day of his death.

The pretender was crowned at Westminster on the 22nd of December 1135—less than a month after his uncle’s death. No one yet openly withstood him, but he was well aware that his position was precarious, and that the claims of Matilda would be brought forward ere long by the section of the baronage which had not yet got from him all they desired. Meanwhile, however, he was encouraged to persevere by the fact that his brother Theobald had withdrawn his claim to the dukedom of Normandy, and retired in his favour. For a space he was to be duke as well as king; but this meant merely that he would have two wars, not one, in hand ere long. Matilda’s adherents were already in the field in Normandy; in England their rising was only delayed for a few months.

Stephen, though he had shown some enterprise and capacity in his successful snatch at the crown, was a man far below his three predecessors on the throne in the matter of perseverance and foresight. He was a good fighter, a liberal giver, a faithful friend, but he lacked wisdom, caution, and the power to organize. Starting his career as a perjurer, it is curious that he was most slowly to suspect perjury in others; he was the most systematically betrayed of all English kings, because he was the least suspicious, and the most ready to buy off and to forgive rebels. His troubles began in 1136, when sporadic rebellions, raised in the name of Matilda, began to appear; they grew steadily worse, though Stephen showed no lack of energy, posting about his realm with a band of mercenary knights whenever trouble broke out. But in 1138 the crisis came; the baronage had tried the capacity of their new master and found him wanting. The outbreak was now widespread and systematic civil war. —caused not by the turbulence of a few wild spirits, but by the deliberate conspiracy of all who saw their advantage in anarchy. Matilda had a few genuine partisans, such as her half-brother Robert, earl of Gloucester, the illegitimate son of Henry I., but the large majority of those who took arms in her name were ready to sell their allegiance to either cause in return for lands and privileges promised. A long list of doubly and triply forsworn nobles, led by Geoffrey de Mandeville, Aubrey de Vere and Ralph of Chester, made the balance of war sway alternately from side to side, as they transferred themselves to the camp of the highest bidder. It is hard to trace any meaning in the civil war—it was not a contest between the principle of hereditary succession and the principle of elective kingship, as might be supposed. It was rather, if some explanation must be found for it, a strife between the kingly power and feudal anarchy. Unfortunately for England the kingly power was in the hands of an incapable lord, and feudal anarchy found a plausible mask by adopting the disguise of loyalty to the rightful heirs.

The civil war was not Stephen’s only trouble; foreign invasion was added. David I., king of Scotland, was the uncle of Matilda, and used her wrongs as the plea for thirve invading northern England, which he ravaged with great cruelty. His most formidable raid was checked by the Yorkshire shire levies, at the battle of the Standard (Aug. 22, 1138). Yet in the following year he had to be bought off by a voluntary gift of all Northumberland (savings from the income of his Castles in Carlisle) to his son Earl Henry. Carlisle and Cumberland were already in his hands. Some years later the Scottish prince also got possession of the great “ Honour of Lancaster.” It was not Stephen’s fault that the boundary of England did not permanently recede from the Tweed and the Solway to the Tyne and the Ribble.

But the affairs of the North attracted little attention while the civil war was at its height in the South. In 1139 Stephen had wrought himself fatal damage by quarrelling with the ecclesiastical bureaucrats, the kinsmen and allies of Roger of Salisbury, who had been among his earliest adherents. Jealous of their power and their arrogance, and doubting their loyalty, he imprisoned them and confiscated their lands. This threw the whole church party on to the side of Matilda; even Henry, bishop of Winchester, the king’s own brother, divorced him and passed over to the other side. Moreover, the whole machinery of local government in the realm fell out of gear, when the experienced ministers who were wont to control it were removed from power.

Matilda had landed in England in the winter of 1139-1140; for a year her partisans made steady progress against the king, and on the 2nd of February 1141 Stephen was defeated and taken prisoner at the battle of Lincoln. All England, save the county of Kent and a few isolated castles elsewhere, submitted to Matilda. She was bailed as a sovereign by a great assembly at Winchester, over which Stephen’s own brother Bishop Henry presided (April 7, 1141) and entered London in triumph in June. It is doubtful whether she would have obtained complete possession of the realm if she had played her cards well, for there were too many powerful personages who were interested in the perpetuation of the civil war. But she certainly did her best to ruin her own king, for her indignation to resume at once all the powers that her father had possessed. When she annulled all the royal grants of the last six years, declared charters forfeited and lands confiscated, and began to raise heavy and arbitrary taxes, she made the partisans of Stephen desperate, and estranged many of her own supporters. A sudden rising of the citizens drove her out of London, while she was making preparations for her coronation. The party of the imprisoned king rallied under the wise guidance of his wife Matilda of Boulogne and his brother Henry, and many of the late deserters adhered to it. Their army drove the lately triumphant party out of Winchester, and captured its military chief, Robert, earl of Gloucester. So much was his loss felt that his sister exchanged him a few months later for King Stephen.

After this the war went on interminably, without complete advantage to either side, Stephen for the most part dominating the eastern and Matilda the western shires. It was the zenith of the power of the baronial anarchists, who moved from camp to camp with shameless rapidity, wreaking from one or other of the two rival sovereigns some royal castle, or some dangerous grant of feudal baronage, on any affair which attracted their interest. The kingdom was in the desperate state described in the last melancholy pages of the Anglo-Saxon Chronicle, when life and property were nowhere safe from the objectless ferocity of feudal tyrants —when “every shire was full of castles and every castle filled with devils and evil men,” and the people murmured that “Christ and his saints slept.”

Such was England’s fate till 1153, when Matilda had retired from the strife in favour of her son, Henry of Anjou, and Stephen was grown an old man, and had just lost his heir, Eustace, to whom he had desired to pass on the crown. Both parties were exhausted, both were sick of the incessant treachery of their more unscrupulous barons, and at last they came to the compromise of Wallingford (October 1153), by which it was agreed that Stephen should reign for the remainder of his life, but that on his death the crown should pass to Henry. Both sides promised to lay down their arms, to dismiss their mercenaries, and to acquiesce in the destruction of unlicensed castles, of which it is said, with no very great exaggeration, that there were at the moment over 1000 in the realm. Henry then returned to Normandy, of which his mother had been in possession since 1145, while Stephen turned his small remaining strength to the weighty task of endeavouring to restore the foundations of law and order. But he had accomplished little when he died in October 1154. The task of reconstruction was to be left to Henry of Anjou: his predecessor was only remembered as an example of the evil that may be done by a weak man who has been reckless enough to seize a throne which he is incapable of defending. England has had many worse kings, but never one who wrought her more harm. If his successor had been like him, feudal anarchy might have become as permanent in England as in Poland.
Fortunately the young king to whom Stephen's battered crown now fell was energetic and capable, if somewhat self-willed and hasty. He was inferior in caution and self-control to his grandfather Henry I, though he resembled him in his love of strong and systematic government. From the point of view of his English subjects his main achievement was that he restored in almost every detail the well-organized bureaucracy which his ancestor had created, and with it the law and order that had disappeared during Stephen's unhappy reign. But there was this essential difference between the position of the two Henries, that the elder aspired to be no more than king of England and duke of Normandy, while the younger strove all his life for an imperial position in western Europe. Such an ambition was almost forced upon him by the consequences of his descent and his marriage. Besides his grandfather's Anglo-Norman inheritance, he had received from his father Geoffrey's inheritance in Poitou and Touraine, and the possessions in the valley of the Lower Loire which he had married into. His marriage to Eleanor of Aquitaine, two years before his accession to the English throne, which gave him the right to dream of greatness such as his Norman forebears had never enjoyed. This lady, the divorced wife of Louis VII. of France, brought to his second husband the whole of the lands from Poitou to the Pyrenees, the accumulated gains of many warlike ancestors. In wealth and fighting strength the duchy of Aquitaine was a full third of France. Added to Anjou and Normandy it made a realm far more important than England. Hence it came that Henry's ambitions and interests were continental more than English. Unlike his grandfather he dwelt for the greater part of his time beyond seas. It must be remembered, too, that his youth had been spent abroad, and that England only came to him when he was already a grown man. The concerns of his island realm were a matter of high importance to him, but only formed a part of his ambitions. Essentially he was an Angevin, neither a Norman nor an Englishman, and his primary ambition was to make the house of Anjou supreme in France. Nor did this seem impossible; he owned a far broader and wealthier domain beyond the Channel than did his nominal suzerain King Louis VII. — and what was of more importance — he far excelled that prince both in vigour and in capacity.

On succeeding to the English crown, however, he came over at once to take possession of the realm, and abode there for over a year, displaying the most restless energy in setting to rights the government of the realm. He expelled all Stephen's mercenaries, took back into his hands the royal lands and castles which his predecessor had granted away, and destroyed hundreds of the "adulterine" castles which the barons and knights had built without leave during the years of the anarchy. Hardly a single man was as much as to oppose him — Bridgnorth, now a castle of the Mortimers, was the only place which he and his force failed to take by force. His next care was to restore the bureaucracy by which Henry I had been wont to govern. He handed over the exchequer to Nigel, bishop of Ely, the nephew of the old justiciar Roger of Salisbury, and the heir of his traditions. His chancellor was a young clerk, Thomas Becket, who was recommended to him by archbishop Theobald as the most capable official in the realm. A short experience of his work convinced the king that his merits had not been exaggerated. He proved a zealous and capable minister, and such a strong exponent of the claims of the crown that no one could have foreseen the later developments by which he was to become their greatest enemy.

The machine of government was beginning to work in a satisfactory fashion, and the realm was already settling down into order, when Henry was called abroad by a rebellion raised in Anjou by his brother Geoffrey — the first of the innumerable dynastic troubles abroad which continued throughout his reign. It distracted his attention from his duties as an English king. He did not return for fifteen months; but when he did reappear it was to complete the work which he had begun in 1155, to extort from the greater barons the last of the royal forfeitures which still remained in their hands, and to restore the northern baronies of the realm. Malcolm IV., the young king of Scotland, was compelled to give up the earldoms of Northumberland and Cumberland, which his father Henry had received from Stephen. He received instead only the earldom of Huntingdon, but far from the border to be a dangerous possession, to which he had a hereditary right as descending from Earl Waltheof. He did homage to the king of England, and actually followed him with a great retinue on his next continental expedition. In the same year (1157) Henry made an expedition into North Wales, and forced its prince Owen to become his vassal, not without some fighting, in which the English army received several sharp checks at the commencement of the campaign. Yet once more Henry's stay on the English side of the Channel was but for a year. In 1158 he again departed to plunge into schemes of continental conquest. This time it was an attempt to annex the great county of Toulouse, and so to carry the borders of Aquitaine to the Mediterranean, which distracted him. Naturally Louis of France was unwilling to see his great rival.easing all across his realm, and did what he could to hinder him. Into the endless skirmishes and negotiations which followed the raising of the question of Toulouse it would be fruitless to enter. Henry did not achieve his purpose, indeed he seems to have failed to use his strength to its best advantage, and allowed himself to be bought off by a futile marriage treaty by which his eldest son was to marry the French king's daughter (1160). This was to be but the first of many disappointments in this direction; there was apparently some fatal scruple, both in Henry's own mind and in that of his continental subjects, as to pressing their suzerain too hard. But it must also be remembered that a feudal army was an inefficient weapon for long wars, and that the mercenaries, by whom alone it could be replaced, were both expensive and untrustworthy. Henry developed as far as he was able the system of "scutage" (q.v.) which his grandfather had apparently invented; by this the vassals compounded for their feudal duties by paying money, with which the king could hire professional soldiers. But even with this help he could never keep a large enough army together.

Meanwhile England, though somewhat heavily taxed, was at least enjoying quiet and strong government. There is every sign that Henry's early years were a time of returning prosperity. But there was also much friction between the crown and its subjects. The more turbulent part of the baronage, looking back to the boisterous times of Stephen with regret, was reserved itself for a favourable opportunity. The danger of feudal rebellion was not yet past, as was to be shown ten years later. The towns did not find Henry an easy master. He took away from London some of the exceptional privileges which his grandfather had granted, such as the free election of sheriffs of Middlesex, and the right of farming the ship tax at a fixed rent. He asserted his power to raise "tallages" — arbitrary taxation — from the citizens on occasion. Yet he left the foundations of municipal liberty untouched, and he was fairly liberal in granting charters which contained moderate privileges to smaller towns. His most difficult task, however, was to come to a settlement with the Church. The lavish grants of Stephen had made an end of the old authority which the Conqueror and Henry I. had exercised over the clergy. Their successor was well aware of the fact, and was resolved to put back the clock, so far as it was in his power. It was not, however, on the old problems of free election, of lay investiture, that his quarrel with the clerical body broke out, but on the comparatively new question of the conflicting claims of ecclesiastical and secular courts. The separate tribunals of the church, whose erection William I. had favoured, had developed in power ever since, and had begun to encroach on the sphere of the courts of the state. This was more than ever the case since Stephen had formally granted personal jurisdictions over all suits concerning clerics and clerical property. During the first few years of his reign Henry had already been in collision with the ecclesiastical authorities over several such cases; he had chafed at seeing two clerks accused of murder and blackmailing claimed by and acquitted in the church courts; and
most of all at the frequency of unlicensed appeals to Rome—a flagrant breach of one of the three rules laid down by William the Conqueror. Being comparatively at leisure after the pacification with France, he resolved to turn his whole attention to the arrangement of a new modus vivendi with the church. As a preliminary move he appointed his able chancellor Thomas Becket to the archbishopric of Canterbury, which fell vacant in 1162. This was the greatest mistake of his reign.

Becket was one of those men who, without being either hypocrites or consciously ambitious, live only to magnify their office. While chancellor he was the most zealous servant of the crown, and had seemed rather secular than clerical in his habits and his outlook on life. But no sooner had he been promoted to the archbishopric than he put away his former manners, became the most formal and austere of men, and set himself to be the champion of the church party in all its claims, reasonable or unreasonable, against the state. The king's astonishment was even greater than his indignation when he saw the late chancellor setting himself to oppose him in all things. Their first quarrel was about a proposed change in some details of taxation, which seems to have had no specially ecclesiastical bearing at all. But Becket vehemently opposed it, and got so much support when the great council met at Woodstock the king withdrew his schemes. This was only a preliminary skirmish; the main battle opened in the following year, when the king, quite aware that he must for the future look to Thomas as his enemy, brought forward the famous Constitutions of Clarendon, of which the main purport was to assert the jurisdiction of the state over clerical offenders by a rather complicated procedure, while other clauses provided that appeals to Rome must not be made without the king's leave, that suits about land or the presentation to benefices, in which clerics were concerned, should be tried before the royal courts, and that bishops should not quit the realm unless they had obtained permission to do so from the king (see CLARENDON, CONSTITUTIONS OF). Some what to the king's surprise, Becket yielded for a moment to his pressure, and declared his assent to the constitutions. But he had no sooner left the court than he proclaimed that he had grievously sinned in giving way, suspended himself from his archiepiscopal functions, and wrote to the pope to beg for pardon and absolution. He then made a clandestine attempt to escape from the realm, but was detected on the seashore and forced to return.

Incensed with Becket for his repudiation of his original submission, Henry proceeded to open a campaign of lawsuits against him, in order to force him to plead in secular courts. He also took the very mean step of declaring that he should call him to account for all the moneys that had passed through his hands when he was chancellor, though Becket had been given a quittance for them when he resigned the office more than two years before. The business came up at the council of Northampton (October 1164), when the archbishop was tried for refusing to recognize the jurisdiction of the king's courts, and declared to have forfeited his movable goods. The sentence was passed by the lay members of the Curia Regis alone, the bishops having been forbidden to sit, and threatened with excommunication if they did so, by the accused primate. When Becket was visited by the juridicar who came to rehearse the judgment, he started to his feet, refused to listen to a word, declared his repudiation of all lay courts and left the hall. That same night he made a second attempt to escape from England and this time succeeded in getting off to Flanders. From thence he fled to the court of the pope, where he received less support than he had expected. Alexander III. privately approved of all that he had done, and regarded him as the champion of the Church, but he did not wish to quarrel with King Henry. He had lately been driven from Rome by the emperor Frederick I., who had installed an antipope in his place, and had been forced to retire to France. If he sired with Becket and thundered against his persecutor, there was small doubt that the king of England would adhere to the schism. Accordingly he endeavoured to temporize and to avoid a rupture, to the archbishop's great disgust. But since he also declared the Constitutions of Clarendon uncanonical and invalid, Henry was equally offended, and opened negotiations with the emperor and the anti pope. This conduct forced Alexander's hand, and he gave Becket leave to excommunicate his enemies. The exile, who had taken refuge in a French abbey, placed the justiciar and six other of the king's chief councillors under the ban of the Church, and intimated that he should add Henry himself to the list unless he showed speedy signs of repentance (April 1166).

Thus the quarrel had come to a head. Church and State were at open war. Henry soon found that Becket's threats had more effect than he liked. Many of the English clergy were naturally on the side of the primate in a dispute which touched their loyalty to the Church and their class feeling. Several bishops declared to the king that, since his ministers had been duly excommunicated, they did not see how they could avoid regarding them as men placed outside the pale of Christendom. Fortunately the pope interfered for a moment to lighten the friction; being threatened with a new invasion by the emperor Frederick, he suspended the sentences and sent legates to patch up a peace. They failed, for neither the king nor the archbishop would give way. At this juncture Henry was desirous of getting his eldest son and namesake crowned as his colleague, the best mode that he could devise for avoiding the dangers of a disputed succession in England. He induced the archbishop of York, assisted by the bishops of London and Salisbury, to perform the ceremony. This was a clear invasion of the ancient rights of the primate, and Becket took it more to heart than any other of his grievances.

Yet the next move in the struggle was a hollow reconciliation between the combatants—a most inexplicable act on both sides. The king offered to allow Becket to return from exile, and to restore him to his possessions, without exacting from him any promise of submission, or even a pledge that he would not reopen the dispute on his return. Apparently he had made a wrong interpretation of the primate's mental attitude, and thought him desirous of a truce, if not ready for a compromise. He had wholly misjudged the situation; Becket made neither promises nor threats, but three weeks after he reached Canterbury publicly excommunicated the bishops of London and Salisbury for the part that they had taken in the coronation of the young king, and suspended from their functions the other prelates who had been present at the ceremony. He then proceeded to excommunicate a number of his minor lay enemies.

The news was carried overseas to Henry, who was then in Normandy. It roused one of the fits of wild rage to which he was not unfrequently liable; he burst out into ejaculations of wrath, and cursed "the cowardly idle servants who suffered their master to be made the laughing-stock of a low-born priest." Among those who stood about him were four knights, some of whom had personal grudges against Becket, and all of whom were reckless ruffians, who were eager to win their master's favour by fair means or foul. They crossed the Channel with astonishing speed; two days after the king's outbreak they stood before Becket at Canterbury and threatened him with death unless he should remove the excommunications and submit to his master. The archbishop answered with words as scornful as their own, and took his way to the minster to attend vespers. The knights went out to seek their weapons, and when armed followed him into the north transept, where they fell upon him and brutally slew him with many sword-strokes (December 29, 1170). Thomas had been given time to fly, and his followers had endeavoured to persuade him to do so. It seems that he deliberately courted martyrdom, anxious apparently that his death should deal the king the bitterest blow that it was in his power to inflict (see BECKET).

Nothing could have put Henry in such an evil plight; the whole world held him responsible for the murder, and he was forced to buy pardon for it by surrendering many of the advantages over the Church which he had hoped to gain by enforcing the Constitutions of Clarendon. Especially the immunity of clerical offenders from the jurisdiction of lay courts had to be conceded; for the rest of the
middle ages the clerk guilty of theft or assault, riot or murder, could plead his orders, and escape the harsh justice of the king's officers to the milder penalties of the bishop's tribunal. "Benefit of clergy" became an intolerable anomaly, all the more so because the privilege was extended in practice not only to all persons actually in minor orders, but to all who claimed them; any criminal who could read had a fair chance of being reckoned a clerk. Another concession which Henry was forced to make was that the appeals to Rome of litigants in ecclesiastical suits should be freely permitted, provided that they made an oath that they were not contemplating any wrong to the English crown or the English church, a sufficiently easy condition. Such appeals became, and remained, innumerable and vexatious.

Pope Alexander also extorted from the king a pledge that he would relinquish any customs prejudicial to the rights of the Church which had been introduced since his accession. To the pope this meant that the Constitutions of Clarendon were disavowed; to the king, who maintained that they were in the main a mere restatement of the customs of William I, it bore no such general interpretation. The points were fought out in detail, and not settled for many years. Practically it became the rule that "ecclesiastical" land, or presentations to benefices, as pertaining to the king's court, while those regarding probate, marriage and divorce fell to the ecclesiastical tribunal. The question of election to bishoprics and abbeys went back to the stage which it had reached in the time of Henry I; the choice was made in canonical form, by the chapters or the monasteries, but the king's recommendation was a primary factor in that choice. When the electors disregarded it, as was sometimes the case, there was friction; a weak king was sometimes overruled; a strong one generally got his way in the end.

Becket's death, then, gave a qualified triumph to the church party, and he was rightly regarded as the successful champion of his cause. Hence they held his death in grateful remembrance; the pope canonized him in 1173, and more churches were dedicated to him during the next two centuries than to any other English saint. In the eyes of most men his martyrdom had put the king so much in the wrong that the obstinacy and provocative conduct which had brought it about passed out of memory. His life of ostentatious austerity, and the courage with which he met his death, had caused all his faults to be forgotten. Henry himself felt so much the invidious position in which he was placed that even after making his submission to the pope's legates at Avranches in 1172, he thought it necessary to do penance before Becket's tomb in 1174, on which occasion he allowed himself to be publicly scourged by the monks of Canterbury, who inflicted on him three cuts apiece.

Between the outbreak of the king's quarrel with Becket at the council of Woodstock and the compromise of Avranches no less than ten years had elapsed—the best years of Henry's manhood. During this period his struggle with the Church had been but one of his distractions. His policy of imperial aggrandisement had been in progress. In 1163 he had completed the conquest of South Wales; the marcher lords were now in possession of the greater part of the land; the surviving Welsh princes did homage for the rest. In 1166 Henry got practical possession of the duchy of Brittany, the only remaining large district of western France which was not already under English suzerainty. Count Maurice, the last prince of the old Breton house, recognized him as his lord, and gave the hand of his heiress Constance to Geoffrey, the king's third son. When the count died in 1171 Henry did not transfer the administration of the land to the young pair, who were still but children, but retained it for himself, and clung to it jealously long after his son came of age. Intermittent wars with France during these years were of small importance; Henry never pushed his suzerain to extremity. But the Angevin dominions were extended in a new direction, where no English king had yet made his power felt.

The distressful island of Ireland was at this moment enjoying the anarchy which had reigned therein since the dawn of history. Its state had grown even more unhappy than before since the Danish invasions of the 10th century, which had not welded the native kingdoms into unity by pressure from without—as had been the case in England—but had simply complicated affairs, by setting up two or three alien principalities on the coastline. As in England, the vikings had destroyed much of the old civilization; but they had neither succeeded in occupying the whole country nor had they been absorbed by the natives. The state of the island was much like that of England in the days of the Heptarchy: occasionally a "High King" succeeded in forcing his rivals into a precarious submission; more usually there was not even a pretense of a central authority in the island, and the annals of objectless tribal wars formed its sole history. King Henry's eyes had been fixed on the faction-ridden land since the first years of his reign. As early as 1153 he had asked and obtained the approval of Pope Adrian IV., the only Englishman who ever sat upon the papal throne, for a scheme for the conquest of Ireland. The Holy See had always regarded with distaste the existence in the West of a nation who repudiated the Roman obedience, and lived in schismatical independence, under local ecclesiastical customs which dated back to the 5th century, and had never been brought into line with the decrees of Christendom. Hence, it was natural to sanction an invasion which might bring the Irish within the fold. But Henry made no endeavour for many years to utilize the papal grant of Ireland, which seems to have been made under the preposterous "Donation of Constantine," the forged document which gave the bishop of Rome authority over all islands. It was conveniently forgotten that Ireland had never been in the Roman empire, and so had not even been Constantine's to give away.

Not till 1168, thirteen years after the agreement with Pope Adrian, did the interference of the English king in Ireland actually begin. Even then he did not take the conquest in hand himself, but merely sanctioned a private adventure of some of his subjects. Dermot MacMorrough, king of Leinster, an unquiet Irish prince who for good reasons had been expelled by his neighbours, came to Henry's court in Normandy, proffering his allegiance in return for restoration to his lost dominions. The quarrel with Becket, and the French war, were both distracting the English king at the moment. He could not spare attention for the matter, but gave Dermot leave to enlist auxiliaries among the turbulent barons of the South Welsh Marches. The Irish exile enlisted first the services of Maurice Fitzgerald and Robert Fitzstephen, two half-brothers, both noted fighting men, and afterwards those of Richard de Clare, earl of Pembroke, an ambitious and imperious magnate of broken fortunes. The two barons were promised lands, the earl a greater bribe—the land of Dermot's only daughter Eva and the inheritance of the kingdom of Leinster. Fitzgerald and Fitzstephen crossed to Ireland in 1169 with a mere handful of followers. But they achieved victories of an almost incredible completeness over Dermot's enemies. The undisciplined hordes of the king of Osory and the Danes of Wexford could not stand before the Anglo-Norman tactics—the charge of the knights and the arrow-flight of the archers, skilfully combined by the adventurous invaders. Dermot was triumphant, and sent for more auxiliaries, aspiring to evict Roderic O'Conor of Connaught from the precarious throne of High King of Ireland. In 1170 the earl of Pembroke came to Ireland with a larger force, celebrated his marriage, with Dermot's daughter, and commenced a series of conquests. He took Waterford and Dublin from the Danes, and scattered the hosts of the native princes. Early in the next spring Dermot died, and Earl Richard, in virtue of his marriage, claimed the kingship of Leinster. He held his own, despite the assaults of a great army gathered by Roderic the High King, and of a Viking fleet which came to help the conquered jarls of Waterford and Dublin. At this moment King Henry thought it necessary to interfere; if he let more time slip away, Earl Richard would become a powerful king and forget his English allegiance. Accordingly, with a large army at his back, he landed at Waterford in 1171 and marched on Dublin. Richard did him homage for Leinster, engaging to hold it as a palatine earldom, and not to claim the name or rights of a king. The other adventurers
followed his example, as did, after an interval, most of the native Irish princes. Only Roderic of Connaught held aloof in his western dominions, asserting his independence. The clergy, almost without a murmur, submitted themselves to the Roman Church.

Such was the first conquest of Ireland, a conquest too facile to be secured. Four years later it appeared to be completed by the submission of the king of Connaught, who did homage like the rest of the island. But, with other signs, the Anglo-Norman conquest of the native chief was not to be completed for 400 years. What happened was that the Anglo-Norman invaders pushed gradually west, occupying the best of the land and holding it down by the castle, by the engravings of boroughs and mountains, by the local princes. The king's writ only ran in and about Dublin and a few other harbour strongholds. Inland, the warring barons and the Irish chiefs fought perpetually, with varying fortunes. The conquer could hardly touch them or their western Ulster, and left half Connaught unsubdued: even in the immediate vicinity of Dublin the tribes of the Wicklow Hills were never properly tamed. The English conquest was incomplete; it failed to introduce either unity or strong government. A century and a half began to recede rather than to advance. Many of the districts which had been overrun in the time of the Angevin kings were lost; many of the Anglo-Norman family intermarried with and became absorbed by the Irish; they grew as careless of their allegiance to the crown as any of the native chiefs. The "lordship of Ireland" was now a reality till the times of the Tudors. But as long as Henry II lived this could not have been foreseen. The first generation of the conquerors pushed their advance with such vigour that it seemed likely that they would complete the adventure. (See Ireland: History.)

It was in 1173, the year after his return from Ireland and his submission to the papal legates at Avranches, that King Henry became involved in the first of a series of troubles which were to pursue him for the rest of his life—the rebellion of his graceless sons. His wife Eleanor of Aquitaine had borne him many children. Henry, the eldest surviving son, had already been crowned in 1140 as his father's colleague and successor; not only he, but Richard the second, and Geoffrey the third, were now old enough to challenge for the estates imposed upon them by their father, a wise, strong, and strong-willed father. The old king very naturally preferred to keep his dominions united under his own immediate government, but he had designated his eldest son as his successor in England and Normandy, while Richard was to have his mother's inheritance of Aquitaine, and Geoffrey's wife's dowry, the duchy of Brittany, was due to him, now that he had reached the verge of manhood. The princes were shamelessly eager to enter upon their inheritance, the king was loath to understand that by conferring a titular sovereignty on his sons he had given them a sort of right to expect some share of real power. Their grudge against their father was sedulously fostered by their mother Eleanor, a clever and venomous woman, who could never forgive her husband for keeping her in the background in political matters and insulting her by his frequent amours. Her old subjects in Aquitaine were secretly encouraged by her to follow her son Richard against his father, whom the barons of the south always regarded as an alien and an intruder. The Bretons were equally willing to rise in the name of Geoffrey and Constance against the guardian who was keeping them too long waiting for their inheritance. In England the younger Henry had built himself up a party among the most turbulent section of the baronage, who remembered with hatred and longing the carnival of licence which their fathers had enjoyed under King Stephen. Secret agreements had also been made with the kings of France and Scotland, who were eager to take advantage of the troubles which were about to break out.

In 1173 the plot was complete, and Henry's three eldest sons all took arms against him, collecting Norman, Breton and Gascon rebels in great numbers, and being backed by a French army. At the same moment the king of Scots invaded Northumberland, and the earls of Norfolk, Chester and Leicester rose in the name of the younger Henry. This was in all essentials a feudal rebellion of the old type. The English barons were simply desirous of getting rid of the strong and effective governance of the king, and the alleged wrongs of his sons were an empty excuse. For precisely the same reason all classes in England, save the more turbulent section of the baronage, remained faithful to the elder king. The bureaucracy, the minor landholders, the towns, and the clergy refused to join in the rising, and lent their aid for its suppression, because they were unwilling to see anarchy commence. Hence, though the rebellious princes made head for a time against their father abroad, the inscription of their partisans in England was suppressed without much difficulty. The justiciar, Richard de Lucy, routed the army of the earl of Leicester at Forthorn in Suffolk, the castles of the rebel earls were subdue one after another, and William of Scotland was surprised and captured by a force of northern loyalists while he was besieging Alnwick (1173-1174). The war lingered on for a space on the continent; but Henry raised the siege of Rouen, which was being attacked by his eldest son and the king of France; captured Richard's castles in Poitou, and then received the submission of his undutiful children. Showing considerable magnanimity, he promised to grant to each of them all the revenues of the lands in which they were his destined heirs, and a certain number of castles to hold as their own. Their allies fared even less; the rebel earls were subjected to heavy fines, and their strongholds were demolished. The king of Scots was forced to buy his liberty by doing homage to Henry for the whole of his kingdom. Queen Eleanor, whom her husband regarded as responsible for the whole rebellion, was placed in a sort of honourable captivity, or retirement, and denied her royal state.

Henry appeared completely triumphant; but the fourteen years which he had yet to live were for the most part to be times of trouble and frustrated hopes. He was growing old; the indomitable energy of his early career was beginning to slacken; his dreams of extended empire were ofering. In the last period of his life he was more set on defending what he already enjoyed, and perfecting the details of administration in his realms, than on taking new adventures in hand. Probably the truest index of his dominions would be broken up among his sons after his death had a disheartening effect upon him. At any rate his later years bear a considerable resemblance to the corresponding period of his grandfather's reign. The machinery of government which he did not have sketched out the other completed. Under Henry II, the courts of the itinerant justices became regular instead of intermittent; the judicial functions of the Curia Regis were delegated to a permanent committee of that body which took form as the court of king's bench (Curia Regis in Banco). The sheriffs were kept very tightly in hand, and under incessant supervision; once in 1170 nearly the whole body of them were dismissed for misuse of their office. The shire levies which had served the king so well against the feudal rebels of 1173 were reorganized, with uniformity of weapons and armour, by the Assise of Arms of 1181. There was also a considerable amount of new legislation with the object of protecting the minor subjects of the crown, and the system of trial by juries was advanced to the development of the ancient system of trial by the king and trial by wager of battle. The 13th-century jury was a rough and primitive institution, which acted at once as accused, witness and judge—but it was at any rate preferable to the chances of the red-hot iron, or the club of the duelst.

The best proof that King Henry's orderly if autocratic régime was appreciated at its true value by his English subjects, is that when the second series of rebellions raised by his undutiful sons began in 1182, there was no stir whatever in England, though in Normandy, Brittany and Aquitaine the barons rose in full force to support the young princes, whose success would mean the triumph of particularism and the destruction of the Angevin empire. Among the many troubles which broke down Henry's strong will and great bodily vigour in those unhappy
years, rebellion in England was not one. For this reason he was almost constantly abroad, leaving the administration of the one loyal section of his realm to his great justiciar. Hence the story of the unnatural war between father and sons has no part in English history. It is but necessary to note that the younger Henry died in 1183, that Geoffrey perished by accident at a tournament in 1186, and that in 1189, when the old king's strength finally gave out, it was Richard who was leading the rebellion, to which John, the youngest and least worthy of the four undutiful sons, was giving secret countenance. It was the discovery of the treachery of this one child whom he had deemed faithful, and loved over well, that broke Henry's heart. "Let things go as they will; I have nothing to care for in the world now," he murmured on his death-bed, and turned his face to the wall to breathe his last.

The death of the younger Henry had made Richard heir to all his father's lands from the Tweed to the Billusaoa save Brittany, which had fallen to Arthur, the infant son of the unlucky Geoffrey. John, the new king's only surviving brother, had been declared "Lord of Ireland" by his father; in 1185, but Henry had been forced to remove him for persistent misconduct, and had left him nothing more than a titular sovereignty in the newly conquered island. Richard confirmed him at his accession, and gave him a more tangible endowment by allowing him to marry Isabella, the heiress of the earldom of Gloucester, and by bestowing on him the honour of Lancaster and the shires of Derby, Devon, Cornwall and Somerset. The gift was over-liberal and the recipient was thankless; but John was distinctly treated as a vassal, not granted the position of an independent sovereign.

Of all the medieval kings of England, Richard I. (known as Cœur de Lion) cared least for his realm on the English side of the Channel, and spent least time within it. Though he had been born in Oxford, he was far more of a foreigner than his father; his soul was that of a south French baron, not that of an English king. Indeed he looked upon England more as a rich area for taxation than as the centre of a possible empire. His ambitions were continental: so far as he had a policy at all it was Angevin—he would gladly have increased his dominions on the side of the upper Loire and Garonne, and was set on keeping it. The fall of Philip Augustus, though the latter had been his ally during his long struggle with his father. Naturally the policy of Richard as a newly crowned king was bound to differ from that which he had pursued as a rebellious prince. As regards his personal character he has been described, not without truth, as a typical man of his time and nothing more. He was at heart a chivalrous adventurer delighting in war for war's sake; he was not destitute of a conscience—his undutiful conduct to his father sat heavily on his soul when that father was once dead; he had a strong sense of knightly honour and a certain magnanimity of soul in times of crisis; but he was harsh, thriftless, often cruel, generally lacking in firmness and continuity of purpose, always careless of his subjects' welfare when it interfered with his pleasure or his ambitions of the moment. If he had stayed long in England he would have made himself hated, but he was nearly always absent; it was only as a reckless and spasmodic extortioner of taxation, not as a personal tyrant, that he was known on the English side of the Channel.

At the opening of his reign Richard had one all-engrossing desire; he was set on going forth to the Crusade for the recovery of Jerusalem which had been proclaimed in 1187, partly from chivalrous instincts, partly as a penance for his misconduct to his father. He visited England in 1189 only in order to be crowned, and to raise as much money for the expedition as he could procure. He obtained enormous sums, by the most unwise and iniquitous expedients, mainly by selling to any buyer that he could find valuable pieces of crown property, high offices and dangerous rights and privileges. The king of Scotland bought for 15,000 marks a release from the homage to the English crown which had been imposed upon him by Henry II. The chancellorship, one of the two chief offices in the realm, was sold to William Longchamp, bishop of Ely, for 3,000, though he was well known as a tactless, arrogant and incapable person. The earldom of Northumberland, with palatine rights, was bought by Hugh Pulset, bishop of Durham. Countless other instances of unwise bargains could be quoted. Having raised every penny that he could procure by legal or illegal means, Richard crossed the Channel, and embarked at Marseilles with a great army on the 7th of August 1190. The only security which he had for the safety of his dominions in his absence was that his most dangerous neighbour, the king of France, was also setting out on the Crusade, and that his brother John, whose shifty and treacherous character gave sure promise of trouble, enjoyed a well-merited unpopularity both in England and in the continental dominions of the crown.

Richard's crusading exploits have no connexion with the history of England. He showed himself a good knight and a capable general—the capture of Acre and the victory of Arsuf were highly to his credit as a soldier. But he quarrelled with all the other princes of the Crusade, and showed himself as lacking in tact and diplomatic ability as he was full of military capacity. The king of France departed in wrath, to raise trouble at home; the army gradually melted away, the prospect of recovering castles and dominions that had disappeared, and finally Richard must be reckoned fortunate in that he obtained a place in the Crusade, in which the coastland of Palestine was preserved for the Christians, while the Holy City and the inland was sacrificed (Sept. 2, 1192). While returning to his dominions by the way of the Adriatic, the king was shipwrecked, and found himself obliged to enter the dominions of Leopold, duke of Austria, a prince whom he had offended at Acre during the Crusade. Though he disguised himself, he was detected by his old enemy and imprisoned. The duke then sold him to the emperor Henry VI., who found pretexts for forcing him to buy his freedom by the promise of a ransom of 150,000 marks. It was not till February 1194 that he got loose, after paying a considerable instalment of this vast sum. The main bulk of it, as was to be expected, was never made over; indeed it could not have been raised, as Richard was well aware. But, once free, he had no scruple in cheating the imperial brigand of his blackmail.

For five years Richard was away from his dominions as a crusader or a captive. There was plenty of trouble during his absence, and might have been expected.

The strong government set up by John was not competent to maintain itself, even when Richard's ministers were tactless and his brother treacherous. A generation before it is certain that England would have been convulsed by a great feudal rising when such an opportunity was granted to the barons. Nothing of the kind happened between 1190 and 1194. The chancellor William Longchamp made himself odious by his vanity and autocratic behaviour, and was overthrown in 1191 by a general rising, which was headed by Prince John, and approved by Walter, archbishop of Rouen, whom Richard had sent to England with a commission to assume the justiciar-ship if William should prove impossible as an administrator. Longchamp fled to the continent, and John then hoped to seize on supreme power, even perhaps to grasp the crown. But he was bitterly disappointed to find that he could gather few supporters; the justiciar and the bureaucrats of the Curia Regis would give him no assistance; they worked on honestly in the name of the absent king. Among the baronage hardly a man came forward to make him believe to treason. In vain John hired foreign mercenaries, garrisoned his castles, and left a garrison of men with the king of France when the latter returned from the Crusade. It was only the news of his brother's captivity in Austria which gave the intriguing prince a transient hope of success. Boldly asserting that Richard would never be seen alive again he went to France, and did homage to King Philip for Normandy and Aquitaine, as if they were already his own. Then he crossed to England with a band of mercenaries, and seized Windsor and Wallingford castles. But no one rose to aid him, and his garrisons were soon being besieged by loyal levies, headed by the justiciar and by Hubert Walter, the newly elected archbishop of Canterbury.
At the same time King Philip's invasion of Normandy was repulsed by the barons of the duchy. Richard's faithful ministers, exiled of all their distractions, succeeded in raising the first instalment of his ransom by grinding taxation—a fourth part of the revenue of all lay persons, a tithe from ecclesiastical land, was raised, and in addition much church plate was seized, though the officials who exacted it were themselves prelates. John and Philip wrote to the emperor to beg him to detain his captives at all costs, but Henry VI. pocketed the ransom money and set Richard free. He reached England in March 1194, just in time to receive the surrender of the last two castles which were holding out in his treacherous brother's name. With astonishing, and indeed misplaced, magnanimity, Richard pardoned his brother, when he made a grovelling submission, and restored him to his lordship of Ireland and to a great part of his English lands. The king abode for no more than three months in England; he got himself recrowned at Winchester, apparently to wipe out the stain of his German captivity and of an enforced homage which the emperor had extorted from him. Then he raised a heavy tax from his already impoverished subjects, sold a number of official posts and departed to France—never to return, though he had still five years to live. He left behind Archbishop Hubert Walter as justiciar, a faithful if somewhat high-handed minister, skilled in ordering the state, and made Hubert's brother Richard, the bishop of Bayeux, answer for his unfriendly conduct during his absence. He plunged into a war with this clever and shifty prince, which lasted—with certain short breaks of truces and treaties—till his death. He wasted his considerable military talents in a series of skirmishes and sieges which had no great results, and after spending countless treasures and harrying many regions, perished obscurely by a wound from a cross-bow-bolt, received while beleaguering Châtillon, a castle of a rebellious lord of Aquitaine, the viscount of Limoges (April 6, 1199).

During these years of petty strife England was only reminded at intervals of her king's existence by his intermittent demands for money, which his ministers did their best to satisfy. The machine of government continued to work without his supervision. It has been observed that, from one point of view, England's worst kings have been her best; that is to say, a sovereign like Richard, who persistently neglected his duties, was unconsciously the foster father of constitutional liberty. For his ministers, bureaucrats of a sort, self-satisfied by the prior success of their handing, relied on rules and customs which became permanent, and could be cited against those later kings who interfered more actively in the details of domestic governance. We may trace back some small beginnings of a constitution to the time of Henry II.—himself an absentee though not on the scale of his son. But the ten years of Richard's reign were much more fruitful in the growth of institutions which were destined to curb the power of the crown. His justiciars, and especially Hubert Walter, were responsible for several innovations which were to have far-spreading results. The most important was an extension of the use of juries into the province of taxation. When the government employs committees chosen by the taxpayers to estimate and assess the details of taxation, it will find it hard to go back to arbitrary exactions. Such a practice had been first seen when Henry II., in his last year, allowed the celebrated "Saladin Tithe" for the service of the crusade to be assessed by local jurors. In Richard's reign the practice became regular. In especial when England was measured out anew for the great carucage of 1197—a tax on every piece of land. Richard made the rough calculation of Domesday Book—knights elected by the shires shone through the calculations then made for the new impost. Another constitutional advance was that which substituted "coronors," knights chosen by the county court, for the king's old factotum the sheriff in the duty of holding the "pleas of the crown," i.e. in making the preliminary investigations into such offences as riot, murder or injury to the king's rights or property. The sheriff's natural impulse was to indict every man from whom money could be got; the new coronors were influenced by other motives than financial capacity, and so were much more likely to deal equitably with accusations. The towns also profited in a small degree from Richard's absence and impecuniosity. One of the most important charters to London, that which granted the city the right of constituting itself a "community," and choosing itself a mayor, goes back to October 1191, the troubled month of Longchamp's expulsion from England. It was given by Prince John and the ministers, who were then supporting him against the arrogant chancellor, to secure the adherence of London. Richard on his return seems to have allowed it to stand. Lincoln was also given the right of electing its own magistrates in 1194, and many smaller places owe grants of more or less of municipal privilege to Hubert Walter acting in the name of the absent king. The English nation began to have some conception of a régime of fixed custom, in which its rights depended on some other source than the sovereign's personal caprice. The times, it may be remembered, were not unprosperous. There had been no serious civil war since the baronial rising of 1173. Prince John's turbulence had only affected the neighbourhood of a few royal castles. Despite of the frequent and heavy demands for money for the king's service, wealth seems to have been increasing, and prosperity to have been widespread. Strong and regular government had on the whole prevailed ever since Henry II. triumphed over baronial anarchy.

III. THE STRUGGLE FOR CONSTITUTIONAL LIBERTY (1190-1337)

Richard's queen, Berengaria of Navarre, had borne him no children. At the moment of his premature death his nearest kinsmen were his worthless brother John, and the boy Arthur of Brittany, the heir of Geoffrey, the third son of Henry II. On his death-bed the king had designated John as his successor, holding apparently that a bad ruler who was at least a grown man was preferable to a child. John's claim prevailed both in Normandy and in England, though in each, as we are told, there were those who considered it a doubtful point whether an elder brother's son had not a better right than a younger brother. But the ministers recognized John, and the baronage and nation acquiesced, though with little enthusiasm. In the lands farther south, however, matters went otherwise. The dowager duchess Constance of Brittany raised her son's claim, and sent an army into Anjou, and all down the Loire many of the nobles adhered to his cause. The king of France asserted that he should support them, and allowed Arthur to do him homage for Anjou, Maine and Touraine. These would have been trouble in Aquitaine also, if the aged Queen Eleanor had not asserted her own primary and indefeasible right to her ancestral duchy, and then declared that she transferred it to her best loved son John. Most of her subjects accepted her decision, and Arthur's faction made no head in this quarter. It seemed for a space as if the new king would succeed in retaining the whole of his brother's inheritance, for King Philip very meanly allowed himself to be bought off by the cession of the county of Evreux, and, when his troops were withdrawn, the Angevin rebels were beaten down, and the duchess of Brittany had to ask for peace for her son. But it had not long been granted, when John proceeded to throw away his advantage by acts of reckless policy. Though cunning, he was destitute alike of foresight and of self-control; he could never discern the way in which his conduct would be judged by other men, because he lacked even the rudiments of a conscience. He had been many months on the throne when he divorced his wife, Isabella of Gloucester, alleging that their marriage had been illegal because they were within the prohibited degrees. This act offended the English church, but in choosing a new queen John gave much greater offence abroad; he carried off Isabella of Angoulême from her afflicted husband, Hugh of Lusignan, the son of the count of la Marche, his greatest vassal in northern Aquitaine, and married her despite the precontract. This seems to have been an amorous freak, not the result of any deep-laid policy. Roused by the insult the Lusignans took arms, and a great part of the barons of Poitou joined them. They appealed for aid to Philip of France, who judged it opportune to intervene once
more. He summoned John to appear before him as suzerain, to answer the complaints of his Poitevin subjects, and when he failed to plead declared war on him and declared his domiciles escheated to the French crown for non-fulfilment of his feudal allegiance. He enlisted Arthur of Brittany in his cause by recognizing him once more as the rightful owner of all John's continental fiefs save Normandy, which he intended to take for himself. Philip then entered Normandy, while Arthur led a Breton force into Anjou and Poitou to aid the Logicen. The fortune of war at first turned in favour of the English king. He surprised his nephew while he was besieging the castle of Mirebeau in Poitou, where the old Queen Eleanor was residing. The young duke and most of his chief supporters were taken prisoners (August 1120). Instead of using his advantage aright, John put Arthur in secret confinement, and after some months caused him to be murdered. He is said also to have starved to death twenty-two knights of Poitou who had been among his captives. The assassination of his nearest kinsman, a mere boy of sixteen, was as unwise as it was cruel. It estranged from the king the hearts of all his French subjects, who were already sufficiently disgusted by many minor acts of brutality, as well as by incessant arbitrary taxation and by the reckless ravages in which John's mercenary troops had been indulging. The French armies met what was a triumphant resistance when they entered Normandy, Anjou and Touraine. John sat inert at Rouen, pretending to take his misfortunes lightly, and boasting that "what was easily lost could be as easily won back." Meanwhile Philip Augustus conquered all western Normandy, without having to fight a battle. The great castle of Château Gaillard, which guards the Lower Seine, was the only place which made a strenuous resistance. It was finally taken by assault, despite of the efforts of the gallant castellan, Roger de Lacy, constable of Chester, who had made head against the besiegers for six months (September 1203–March 1204) without receiving any assistance from his master. John finally absconded to England in December 1203; he failed to return with an army of relief, as he had promised, and before the summer of 1204 was over, Caen, Bayeux and Rouen, the last places that held out for him, had been forced to open their gates. The Norman barons had refused to strike a blow for John, and the cities had shown but a very passive and precarious loyalty to him. He had made himself so well hated by his cruelty and vices that the Normans, forgetting their old hatred of France, had acquis ed in the chapter. Two ties alone had for the last century held the duchy to the English crown: one was that many Norman baronial families held lands on this side of the Channel; the second was the national pride which looked upon England as a conquered appenage of Normandy. But the first had grown weaker as the custom arose of dividing family estates between brothers, on the principle that one should take the Norman, the other the English parts of a paternal heritage. By John's time there were comparatively few landholders whose interests were fairly divided between the duchy and the kingdom. Such as had survived had now to choose between losing the one or the other section of their lands; those whose holding was mainly Norman adhered to Philip; those who had more land in England sacrificed their transmarine estates. For each of the two kings declared the property of the barons who did not support him confiscated to the crown. As to the old Norman theory that England was a conquered land, it had gradually ceased to exist as an operative force, under kings who, like Henry II. or Richard I., were neither Norman nor English in feeling, but Angevin. John did not, and could not, appeal as a Norman prince to Norman patriotism.

The successes of Philip Augustus did not cease with the conquest of Normandy. His armies pushed forward in the south ahead of Anjou, Touraine and nearly all Poitou submitted to him. Only Guienne and southern Aquitaine held out for King John, partly because they preferred a weak and distant master to such a strenuous and grasping prince as King Philip, partly because they were far more alien in blood and language to their French neighbours than were Normans or Angevins. The Gascons were practically a separate nationality, and the house of Capet had no ancient connexion with them. The kings of England were yet to reign at Bordeaux and Bayonne for two hundred and fifty years. But the connexion with Gascony meant little compared with the now vanished connexion with Normandy. Henry I. or Henry II. could run over to his continental dominions in a day or two days; Dieppe and Harfleur were close to Portsmouth and Hastings. It was a different thing for John and his successors to undertake the long voyage to Bordeaux, around the stormy headlands of Brittany and across the Bay of Biscay. Visits to their continental dominions had to be few and far between; they were long, costly and dangerous when a French fleet—a thing never seen before Philip Augustus conquered Normandy—might be roving in the Channel. The kings of England became perforce much more home-keeping sovereigns after 1204.

It was certainly not a boon for England that her present sovereign was destined to remain within her borders for the greater part of her remaining years. To know John well was to loathe him, as every contemporary chronicle bears witness. The two years that followed the loss of Normandy were a time of growing discontent and incessant disputes about taxation. The king kept collecting scutages and tallages, yet barons and towns complained that nothing seemed to be done with the money he collected. At last, however, in 1206, the king did make an expedition to Poitou, and recovered some of its southern borders. Yet, with his usual inconsequence, he did not follow up his success, but made a two years' truce with Philip of France on the basis of ut possidetis—which left Normandy and all the territories on and about the Loire in the hands of the conqueror.

It is probable that this pacification was the result of a new quarrel which John had just taken up with a new enemy—the Papacy. The dispute on the question of free election, which was to range over all the central years of his reign, had just begun. In the end of 1205 Hubert Walter, archbishop of Canterbury, had died. The king announced his intention of procuring the election of John de Gray, bishop of Norwich, as his successor; but, though his purpose was well known, the chapter (i.e. the monks of Christ Church, Canterbury) met secretly and elected their sub-prior Reginald as archbishop. They sent him to Rome at once, to receive confirmation from Pope Innocent III. whom the king kept collecting scutages and tallages, and who had expressed the intention of the rights of the Church. But John descended upon them in great wrath, and by threats compelled them to hold a second meeting, and to elect his nominee Gray, in whose name application for confirmation was also made to the pope. Innocent, however, seeing a splendid chance of asserting his authority, declared both the elections that had taken place invalid, the first because it had been clandestine, the second because it had been held under force majeure, and proceeded to nominate a friend of his own—Cardinal Stephen Langton, an Englishman of proved capacity and blameless life, then resident in Rome. He was far the worthiest of the three candidates, but it was an intolerable invasion of the rights of the English crown and the English Church that an archbishop should be foisted on them in this fashion. The representatives of the chapter who had been sent to Rome were persuaded or compelled to elect him in the pope's presence (Dec. 1206).

King John was furious, and not without good reason; he refused to accept Langton, whom he declared (quite unjustly) to be a secret friend of Philip of France, and sequestrated the lands of the monks of Canterbury. On this the pope threatened to excommunicate himself and his realm. The king replied by issuing a proclamation to the effect that he would outlaw any clerk who should accept the validity of such an interdict and would confiscate his lands. Despising such threats Innocent carried out his threat, and put England under the ban of the Church on the 23rd of March 1208.

In obedience to the pope's orders the large majority of the English clergy closed their churches, and suspended the ordinary course of the services and celebration of the sacraments. Baptism
and extreme mutiny only were continued, lest souls should be lost; and marriages were permitted but not inside the walls of churches. Foreseeing the wrath of the king against all who obeyed the mandate from Rome, the larger number of the bishops and many others of the higher clergy fled overseas to escape the storm. Those who were bold enough to remain behind had much to endure. John, openly rejoicing at the plunder that lay before him, declared the temporalities of all who had accepted the interdict, whether they had exiled themselves or no, to be confiscated. His treasury was soon so well filled that he could dispense with ordinary taxation. He also outlawed the whole body of the clergy, save the timid remnant who promised to disregard the papal commands.

Nothing proves more conclusively the strength of the Angevin monarchy, and the decreasing power of feudalism, than that an unpopular king like John could maintain his strife with the pope, and suppress the discontent of his subjects, for nearly five years before the inevitable explosion came. Probably his long immunity was due in the main to the capacity of his strong-handed justiciar Geoffrey Fitz-Peter; the king hated him bitterly, but generally took his advice. John came to power when Geoffrey died in 1213; his ungrateful master only expressed joy. “Now by God’s feet am I for the first time king of England,” he exclaimed, when the news reached him. He proceeded to fill the vacancy with a mere Poitevin adventurer, Peter des Roches, whom he had made bishop of Winchester some time before. Indeed John’s few trusted confidants were nearly all foreigners, such men as the mercenary captains Gerard of Athies and Engelhart of Cigogné, whom he made sheriffs and castellans to the discontent of all Englishmen. He spent all his money in maintaining bands of hired bravanzons and roviers, by whose aid he for some time succeeded in terrorizing the countryside. There were a few preliminary outbreaks of rebellion, which were suppressed with vigour and punished with horrible cruelty. Johnstarved to death the wife and son of William de Braose, the first baron who took arms against him, and hanged in a row twenty-eight young boys, hostages for the fidelity of their fathers, Welsh princes who had dabbled in treason. Such acts provoked rage as well as fear, yet the measure of John’s iniquities was not fully till 1212. Indeed for some time his persistent prosperity provoked the indignant surprise of those who believed him to be under a curse. If his renewed war with Philip of France was generally unsuccessful, yet at home he held his own. The most astounding instance of his success is that in 1210 he found leisure for a hasty expedition to Ireland, where he compelled rebellious barons to do homage, and received the submission of more than twenty of the local kinglets. It is strange that he came back to find England undisturbed behind him.

His long-deserved humiliation only began in the winter of 1212–1213, when Innocent III., finding him so utterly callous as to the interdict, took the further step of declaring him deposed from the throne for contumacy, and handing over the execution of the penalty to the king of France. This act provoked a certain amount of indignation in England, and in the spring of 1213 the king was able to collect a large army on Barham Down to resist the threatened French invasion. Yet so many of his subjects were discontented that he dared not trust himself to the chances of war, and, when the fleet of King Philip was ready to sail, he surprised the world by making a sudden and galling submission to the pope. Not only did he agree to receive Stephen Langton as archbishop, to restore all the exiled clergy to their benefices, and to pay them handsome compensation for all their losses during the last five years, but he took the strange and ignominious step of declaring that he ceded his whole kingdom to the pope, to hold as his vassal. He formally resigned his crown into the hands of the legate Cardinal Pandulf, and took it back as the pope’s vassal, engaging at the same time to pay a tribute of 1000 marks a year for England and Ireland. This was felt to be a humiliating transaction by many of John’s subjects, though to others the joy at reconciliation with the Church caused all else to be forgotten. The political effect of the device was all that John had desired. His new suzerain took him under his protection, and forbade Philip of France to proceed with his projected invasion, though ships and men were all ready (May 1213). John’s safety, however, was secured in a more practical way when his bastard brother, William Longsword, earl of Salisbury, made a descent on the port of Damme and burnt or sunk a whole squadron of the French transports. After this John’s spirits rose, and he talked of crossing the seas himself to recover Normandy and Anjou. But he soon found that his subjects were not inclined to follow him; they were resigned to the loss of the Angevin heritage, whose union with England brought no profit to them, however much it might interest their king. The barons expressed their wish for a peace with France, and when summoned to produce their feudal contingents pleaded poverty, and raised a rather shallow theory to the effect that their services could not be asked for wars beyond seas—against which there were conclusive precedents in the reigns of Henry I. and Henry II. But any plea can be raised against an unpopular king. John found himself obliged to turn back, since hardly a man save his mercenaries had rallied to his standard at Portsmouth. In great anger and indignation he gathered a force of farmers, and even had such as had been unwilling to punish the barons who had taken the lead in the “strike” which had defeated his purpose. But the outbreak of war was to be deferred for a space. Archbishop Langton, who on assuming possession of his see had shown at once that he was a patriotic English statesman, and not the mere delegate of the pope, besought his master to hold back, and, when he refused, threatened to renew the excommunication which had so lately been removed. The old justiciar Geoffrey Fitz-Peter, now on his death-bed, had also refused to pronounce sentence on the defaulters. John hesitated, and meanwhile his enemies began to organize their resistance.

A great landmark in the constitutional history of England was reached when Langton assembled the leading barons, rehearsed to them the charter issued by Henry I. on his accession, and pointed out to them the rights and liberties therein promised by the crown to the nation. For the future they agreed to take this document as their paramount law and principle of demands. It was the first of the many occasions in English history when the demand for reform took the shape of a reference back to old precedents, and now (as on all subsequent occasions) the party which opposed the crown read back into the ancient grants which they quoted a good deal more than had been actually conceded in them. To Langton and the barons the charter of Henry I. seemed to cover all the customs and practices which had grown up under the rule of the bureaucracy which had served Henry II. and Richard I. A correct historical perspective could hardly be expected from men whose constitutional knowledge only ran back as far as the memory of themselves and their fathers. The Great Charter of 1215 was a commentary on, rather than a reproduction of, the old accession pledges of Henry I.

Meanwhile John, leaving his barons to discuss and formulate their grievances, pushed on with a great scheme of foreign alliances, by which he hoped to crush Philip of France. Through the influence of the feudal view of England John was inspired. He reconciled himself with his nephew, the emperor Otto IV. (his sister’s son), and the counts of Flanders and Boulogne, with many other princes of the Netherlands. Their plan was that John should land in Poitou and distract the attention of the French by a raid up the Loire, while the emperor and his vassals should secretly mobilize a great army in Brabant and make a sudden dash at Paris. The scheme was not destitute of practical ability, and if it had been duly carried out would have placed France in such a crisis of danger as she has seldom known. It was not John’s fault that the campaign failed. He sent the earl of Salisbury with some of his mercenaries to join the confederates in Flanders, while he sailed with the main body of them to La Rochelle, whence he marched northward, devastating the land before him. Philip came out
to meet him with the whole levy of France (April 1214), and Paris would have been left exposed if Otto and his Netherlands vassals had struck promptly in. But the emperor was late, and by the time that he was approaching the French frontier Philip Augustus had discovered that John's invasion was but a feint, executed by an army too weak to do much harm. Leaving a small containing force on the Loire in face of the English king, Philip hurried to the north with his main army, and on the 27th of July 1214 inflicted a crushing defeat on the emperor and his allies at Bouvines near Lille. This was the greatest victory of the French medieval monarchy. It broke up the Anglo-German alliance, and gave the conqueror undisturbed possession of all that he had won from the Angevin house and his other enemies.

- Indirectly Bouvines was as important in the history of England as in that of France. John returned to England foiled, and in great anger; he resolved to give up the French war, secured a truce with King Philip by abandoning his attempt to reconquer his lost lands on the Loire, and turned to attack the recalcitrant subjects who had refused to join him in his late campaign beyond the Channel. Matters soon came to a head: on hearing that the king was mobilizing his mercenary bands, the barons met at Bury St Edmunds, and leagued themselves by an oath to obtain from the king a confirmation of the charter of Henry I. (November 1214.) At the New Year they sent him a formal ultimatum, to which he would not assent, though he opened up futile negotiation with them through the channel of the archbishop, who did not take an open part in the rising. At Easter, nothing having been yet obtained from the king, an army headed by five earls, forty barons, and Giles Braose, bishop of Hereford, mustered at Stamford and marched on London. Their captain was Robert FitzWalter, whom they had named "marshal of the army of God and Holy Church." When they reached the capital its gates were thrown open to them, and the mayor and citizens adhered to their cause (May 17). The king, who now tried to turn them back, was taking the cross and declaring himself a crusader, and by making loud appeals for the arbitration of the pope, was forced to retire to Windsor. He found that he had no supporters save a handful of courtiers and officials and the leaders of his mercenary bands; wherefore in despair he accepted the terms forced upon him by the insurgents. On the 15th of June 1215 he sealed at Runnymede, close to Windsor, the famous Magna Carta, in face of a vast assembly among which he had hardly a single friend. It is a long document of 63 clauses, in which Archbishop Langton and a committee of the barons had endeavoured to recapitulate all their grievances, and to obtain redress for them. Some of the clauses are unimportant concessions to individuals, or deal with matters of trifling importance—such as the celebrated weirs or "kiddles" on Thames and Medway, or the expulsion of the condottieri chiefs Gerard d' Athies and Engelhard de Cigogné. But many of them are among the primary imporant in the history of England. The Great Charter must not, however, be overrated as an expression of general constitutional rights; to a large extent it is a mere recapitulation of the claims of the baronage, and gives redress for their feudal grievances in the matters of aids, reliefs, wardships, &c., its object being the repression of arbitrary exactions by the king on his tenants-in-chief. One section, that which provides against the further encroachments of the king's courts on the private manorial courts of the landowners, might even be regarded as retrograde in character from the point of view of administrative efficacy. But it is most noteworthy that the barons, while providing for the abolition of abuses which affect themselves, show an unselfish and patriotic spirit in laying down the rule that all the concessions which the king makes to them shall also be extended by themselves to their own sub-tenants. The clauses dealing with the general govern-ance of the realm are also as enlightened as could be expected from the character of the committee which drafted the charter. There is to be no taxation without the consent of the Great Council of the Realm—which is to consist of all barons, who are to be summoned by individual units, and of all smaller tenants-in-chief, who are to be called not by separate letters, but by a general notice published by the sheriff. It has been pointed out that this provides no representation for sub-tenants or the rest of the nation, so that we are still far from the ideal of a representative parliament. John himself had gone a step farther on the road towards that ideal when in 1215 he had summoned four "discreet men" from every shire to a council at Oxford, which (as it appears) was never held. But this would seem to have been a vain bid for popularity with the middle classes, which had no result at the time, and the barons preferred to keep things in their own hands, and to abide by ancient precedents. It was to be some forty years later that the first appearance of elected shire representatives at the Great Council took place. In 1215 the control of the subjects over the crown in the matter of taxation is reserved entirely for the tenants-in-chief, great and small.

There is less qualified praise to be bestowed on the clauses of Magna Carta which deal with justice. The royal courts are no longer to attend the king's person—a vexatious practice when sovereigns were always on the move, and litigants and witnesses had to follow them from manor to manor—but are to be fixed at Westminster. General rules of indissoluble equity are fixed for the conduct of the courts—no man is to be tried or punished more than once for the same offence; no one is to be arrested and kept in prison without trial; all arrested persons are to be sent before the courts within a reasonable time, and to be tried by a jury of their peers. Fines imposed on unsuccessful litigants are to be calculated according to the measure of their offence, and are not to be arbitrary penalties raised or lowered at the king's good pleasure according to the sum that he imagined that the offender could be induced to pay. No foreigners or other persons ignorant of the laws of England are to be entrusted with judicial or administrative offices.

There is only a single clause dealing with the grievances of the English Church, although Archbishop Langton had been the principal adviser in the drafting of the whole document. This clause, "that the English church shall be free," was, however, sufficiently broad to cover all demands. The reason that Langton did not descend to details was that the king had already conceded the right of free canonical election and the other claims of the clerical order in a separate charter, so that there was no need to discuss them at length.

The special clauses for the benefit of the city of London were undoubtedly inserted as a tribute of gratitude on the part of the barons for the readiness which the citizens had shown in adhering to their cause. There are other sections for the benefit of the commons in general, such as that which gives merchants full right of leaving or entering the realm with their goods on payment of the fixed ancient customs duties. But these clauses are less numerous than might have been expected—the framers of the document were, after all, barons and not burghers.

The most surprising part of the Great Charter to modern eyes is its sixty-first paragraph, that which openly states the king's intention to abide by his promise, and appoints a committee of twenty-five guardians of the charter (twenty-four barons and the mayor of London), who are to coerce their master, by force of arms if necessary, to observe every one of its clauses. The twenty-five were to hear and decide upon any claims and complaints preferred against the king, and to keep up their numbers by co-optation, so that it would seem that the barons intended to keep a permanent watch upon the crown. The clause seems unnecessarily harsh and violent in its wording; but it must be remembered that John's character was well known, and that it was useless to stand on forms of politeness when dealing with him. It seems certain that the drafters of the charter were honest in their intentions, and did not purpose to set up a feudal oligarchy in the place of a royal autocracy. They were only insisting on the maintenance of what they believed to be the ancient and laudable customs of the realm.
promise lasted less than two months; by August 1215 he was already secretly collecting money and hiring more mercenaries. He wrote to Rome to beg the pope to annul the charter, stating that all his troubles had come upon him in consequence of his dutiful conduct to the Holy See. He also stated that he had taken the cross as a crusader, but could not sail to Palestine as long as his subjects were putting him in restraint. Innocent III, at once took the hint; in September Archbishop Langton was suspended for disobedience to papal commands, and the charter was declared uncanonical, null and void. The "troubles of the king and kingdom" were declared excommunicate.

Langton departed at once to Rome, to endeavour to turn the heart of his former patron, a task in which he utterly failed.

Civil War. Many of the clergy who had hitherto supported the baronial cause drew back in dismay at the pope's attitude. But the laymen were resolute, and prepared for open war, which broke out in October 1215. The king, who had already gathered in many mercenaries, gained the first advantage by capturing Rochester Castle before the army of the barons was assembled. So formidable did he appear to them for the moment that they took the deplorable step of inviting the foreign foe to join in the struggle. Declaring John deposed because he had broken his oath to observe the charter, they entrusted the defense of the kingdom to Louis, the son of Philip, because he had married John's niece Blanche of Castile and could assert in her right a claim to the throne. This was most unhappy inspiration, and drove into neutrality or even into the king's camp many who had previously inclined to the party of reform. "But John did his best to disgust his followers by adopting the policy of carrying out fierce and purposeless raids of devastation all through the countryside, while refusing to face his enemies in a pitched battle. He bore himself like a captain of banditti rather than a king in his own country. Presently, when the French prince came over with a considerable army to join the insurgent barons, he retired northward, leaving London and the home counties to his rival. In all the south country only Dover and Windsor castles held out for him. His sole success was that he raised the siege of Lincoln by driving off a detachment of the baronial army which was besieging it.

Death of John. Soon after, while marching from Lynn towards Wisbeach, he was surprised by the tide in the fords of the Wash and lost part of his army and all his baggage and treasure. Next day he fell ill of rage and vexation of spirit, contracted a dysenteric ailment, and died. His successor (Sept. 21) was the best hope that he could do his kingdom. Owing to the unwise and unpatriotic conduct of the barons in summoning over Louis of France to their aid, John had become in some sort the representative of national independence. Yet he was so frankly insolent as a ruler that, save the earls of Pembroke and Chester, all his English followers had left him, and he had no one to back him but the papal legate Gualo and a band of foreign mercenaries. When once he was dead, and his heritage fell to his nine-year-old son Henry III., whom none could make responsible for his father's doings, the whole aspect of affairs was changed.

The aged William Marshal, earl of Pembroke, by far the most important and respectable personage who had adhered to John's cause, assumed the position of regent. He at once offered in the name of the young king pardon and obli
gion of offences to all the insurgent barons. At the same time he reissued the Great Charter, containing all the important concessions which John had made at Runnymede, save that which gave the control of taxation to the tenants-in-chief. Despite this and certain other smaller omissions, it was a document which would satisfy most subjects of the crown, if only it were faithfully observed. The youth of the king and the good reputation of the earl marshal were a sufficient guarantee that, for some years at any rate, an honest attempt would be made to redeem the pledge. Very soon the barons began to return to their allegiance, or at least to slacken in their support of Louis, who had given much offence by his openly displayed distrust of his partisans and his undisguised preference for his French followers. The papal influence was at the same time employed in the cause of King Henry, and Philip of France was forced to abandon open support of his son, though he naturally continued to give him secret help and to send him succours of men and money.

The fortune of war, however, did not turn without a battle. At Lincoln, on the 20th of May 1217, the king, with the help of an Anglo-French army commanded by the count of Perche and the earls of Winchester and Hereford, the former was slain, the other two taken prisoners, with more than 300 knights and barons. This was the death-blow to the cause of Louis of France; when it was followed up by the defeat in the Dover Straits of a fleet which was bringing him reinforcements (Aug. 17), he despaired of success and asked for terms. By the treaty of Lambeth (Sept. 11, 1217) he secured an amnesty for all his followers and an indemnity of 10,000 marks for himself. Less than a month later he quitted England; the victorious royalists celebrated his departure by a second reissue of the Great Charter, which contained some new clauses favourable to the baronial interest.

After the departure of Prince Louis and his foreigners, the earl marshal had to take up much of the same task that had fallen to Henry II. in 1254. Now, as at the death of Stephen, the realm was in the form of "a divided state"; King Henry, who had cloaked his plundering under the pretence of loyal service to the king or the French prince, and of local magnates who had usurped the prerogatives of royalty, each in his own district. It was some years before peace and order were restored in the realm, and the aged Pembroke died in 1219 before his work was completed. After his decease the conduct of the government passed into the hands of the justiciar Hubert de Burgh, and the papal legate Pandulf, to whom the marshal had specially recommended the young king. Their worst enemies were those who during the civil war had been their best friends, the mercenary captains and upstart knights whom John had made sheriffs and castellans. From 1219 to 1224 de Burgh was constantly occupied in evicting the old loyalists from castles which they had seized or offices which they had disgraced. In several cases it was necessary to mobilize an army against a recalcitrant magnate.

The most troublesome of them was Falkes de Breauté, the most famous of King John's foreign condottieri, whose minions held Bedford Castle against the justiciar and the whole shire levy of eastern England for nearly two months in 1224. The castle was taken by the prince at arms hanging on the walls and Falkes escaped with his life and fled to France. It was not till this severe lesson had been inflicted on the faction of disorder that the pacification of England could be considered complete.

The fifty-six years' reign of Henry III. forms one of the periods during which the mere chronicle of events may seem tedious and trivial, yet the movement of national life and constitutional progress was very important. Except during the stirring epoch 1258-1265 there was little that was dramatic or striking in the events of the reign. Yet the England of 1272 was widely different from the England of 1216. The futile and thriftless yet busy and self-important king was one of those sovereigns who irritate their subjects into opposition by injudicious activity. He was not a ruffian or a tyrant like his father, and had indeed not a few of the domestic virtues. But he was constitutionally incapable of keeping a promise or paying a debt. Not being strong-handed or capable, he could never face criticism nor suppress discontent by force, as a king of the type of Henry I. or Henry II. would do. He generally gave way when pressed, without attempting to make any appeal to the commons, but to observe the Great Charter, and be detected in violating it again within a few months. His greatest fault in the eyes of the subjects was his love of foreigners; since John had lost Normandy the English baronage had become as national in spirit as the commons. The old Anglo-Norman houses had forgotten the tradition of their origin, and now formed but a small section of the aristocracy; the newer families, sprung from the officials of the first two Henries, had always been English in spirit.
ENGLISH HISTORY

491

Unfortunately for himself, the third Henry inherited the continental cosmopolitanism of his Angevin ancestors, and found himself confronted with a nation which was growing ever more and more insular in its ideals. He had all the ambitions of his grandfather Henry II.; his dreams were of shattering the newly-formed kingdom of France, the creation of Philip Augustus, and of recovering all the lost lands of his forefathers on the Seine and Loire. Occasionally his views grew yet wider—he would knout up alliances all over Christendom and dominate the West. Nothing could have been wilder and more unpractical than the scheme on which he set his heart in 1255-1257, a plan for conquering Naples and Sicily for his second son. Moreover it was a great hindrance to him that he was a consistent friend and supporter of the papacy. He had never forgotten the services of the legates Pandulf and Guado to himself and his father, and was always ready to lend his aid to the political schemes of the popes, even when it was difficult to see that any English interests were involved in them. His designs, which were always shifting from point to point of the continent, did not appeal in the least to his subjects, who took little interest in Poitou or Touraine, and now whatsoever in Italy. After the troubled times which had lasted from 1214 to 1224 they desired nothing more than peace, quietness and good government. They had no wish to furnish their master with taxation for French wars, or to follow his banner to distant Aquitaine. But most of all did they dislike his practice of flooding England with strangers from beyond seas, for whom offices and endowments had to be found. The moment that he had got rid of the honest and capable old justiciar Hubert de Burgh, who had pacified the country during his minority, and set the machinery of government once more in regular order, Henry gave himself over to fostering horde after horde of foreign favourites. There was first his Poitevin chancellor, Peter des Roches, bishop of Winchester, with a numerous band of his relations and dependents. As a sample of the king's methods it may be mentioned that he once made over nineteen of the thirty-five sheriffsdoms, within a fortnight, to Peter of Rivaux, a nephew of the chancellor. Des Roches was driven from office after two years (1234), and his friends and relatives fell with him. But they were only the earliest of the king's alien favourites; quite as greedy were the second family of his mother, Isabella of Angoulême, who after King John's death had married her old betrothed, Hugh of Lusignan. Henry secured great English marriages for three of them, and made the fourth, Aymer, bishop of Winchester. Their kinsmen and dependents were equally welcomed. Even more numerous and no less expensive to the realm were the Provencal and Savoyard relatives of Henry's queen, Eleanor of Provence. The king made one of her uncles, Boniface of Savoy, archbishop of Canterbury—it was three years before he desisted to come over to take up the post, and then he was discovered to be illiterate and unclerical in his habits, an unworthy successor for Langton and Edmund of Abingdon, the great primates who went before him. Peter of Savoy, another uncle, was perhaps the most shameless of all the beggars for the king's bounty; not only was he made earl of Richmond, but his debts were repeatedly paid and great sums were given him to help his continental adventures. King Henry's personal rule lasted from 1233, the year in which he deprived Hubert de Burgh of his justiciarship and confiscated most of his lands, down to 1258. It was thriftless, arbitrary, and lacking in continuity of policy, yet not tyrannical or cruel. If he had been a worse man he would have been put under control long before by his irritated subjects. All through these twenty-six years he was being opposed and criticised by a party which embraced the wisest and most patriotic section of the baronage and the hierarchy. It numbered among its leaders the good archbishop, Edmund of Abingdon, and Robert Grosseteste, the active and learned bishop of Lincoln; it was not infrequently aided by the king's brother Richard, earl of Cornwall, who did not share Henry's blind admiration for his foreign relatives. But it only found its permanent guiding spirit somewhat late in the reign, when Simon de Montfort, earl of Leicester, became the habitual mouthpiece of the grievances of the nation. The great earl had, oddly enough, commenced his career as one of the king's foreign favourites. He was the grandson of Amelia, countess of Leicester, but his father, Simon the Elder, a magnate whose French interests were greater than his English, had adhered to the cause of Philip Augustus in the days of King John and the Leicester estates had been confiscated. Simon, reared as a Frenchman, came over in 1230 to petition for their restoration. He not only obtained it, but to the great indignation of the English baronage married the king's sister Eleanor in 1238. For some time he was in high favour with his brother-in-law, and was looked upon by the English as no better than Aymer de Valence or Peter of Savoy. But he quarrelled with the sickle king, and adhered long to the party of opposition. A long experience of his character and actions convinced barons and commons alike that he was a just and sincere man, a friend of good governance, and an honest opponent of arbitrary and unconstitutional rule. He had become such a thorough Englishman in his views and prejudices, that by 1250 he was esteemed the natural exponent of all the wrongs of the realm. He was austere and religious; many of his closest friends were among the more serious of the monkish party. In life the man who had started as the king's unpopular minion was known as "Earl Simon the Righteous," and had become the respected leader of the national opposition to his royal brother-in-law.

Though Henry's taxes were vexatious and never-ending, though his subservience to the pope and his flighty interference in foreign politics were ever irritating the magnates and the people, and though outbreaks of turbulence were not unknown during his long period of personal rule, it would yet be a mistake to regard the central years of the 13th century as an unprosperous period for England. Indeed it would be more correct to regard the period as one of steady national development in wealth, culture and unity. The towns were growing fast, and extending their municipal liberties; the necessities of John and the facile carelessness of Henry led to the grant of innumerable charters and privileges. As was to be seen again during the first period of the reign of Charles I., political irritation is not incompatible either with increasing material prosperity or with great intellectual development. The king's futile activity led to ever more frequent gatherings of the Great Council, in which the theory of the constitution was gradually hammered out by countless debates between the sovereign and his subjects. Every time that Henry confirmed the Great Charter, the fact that England was already a limited monarchy became more evident. It is curious to find that—like his father John—he himself contributed unconsciously to advances towards representative government. John's writ of 1213, bidding "discreet men" from each shire to present themselves at Oxford, found its parallel in another writ of 1253 which bids four knightly delegates from each county to appear along with the tenants-in-chief, for the purpose of discussing the king's needs. When county members begin to present themselves along with the barons at the national assembly, the conception of parliament is already reached. And indeed we may note that the precise "parliamentary" first appears in official documents and in official documents about the life of Henry's reign. By its end the term is universally acknowledged and employed.

We may discern during these same years a great intellectual activity. This was the time of rapid development in the universities, where not only were the scholastic philosophy and systematic theology eagerly studied, but figures appear like that of the great Roger Bacon, a scientific researcher of the first rank, whose discoveries in optics and chemistry caused his contemporaries to suspect him of magical arts. His teaching at Oxford in 1250-1257 fell precisely into the years of the worst misgovernance of Henry III. It was the same with law, an essentially 13th-century study; it was just in this age that the conception of law as something not depending on the pleasure of the king, nor compiled from mere collected ancestral customs, but existing as a logical entity, became
which met at Oxford, 1258, the barons informed their master that his misgovernment had grown so hopeless that they were resolved to put him under constitutional restraints. They appointed a committee of twenty-four, in which Simon de Montfort was the leading spirit, and entrusted it with the duty, not only of formulating lists of grievances, but of seeing that they were re-
dressed. Henry found that he had practically no supporters save his unpopular foreign relatives and favourites, and yielded perforce. To keep him in bounds the celebrated “Provisions of Oxford” were framed. They provided that he was to do nothing without the consent of a permanent council of fifteen barons and bishops, and that all his finances were to be controlled by another committee of twenty-four persons. All aliens were to be expelled from the realm, and even the king’s household was to be “reformed” by his self-appointed guardians. The inevitable oath to observe honestly all the conditions of the Great Charter of 1215 was, as usual, extorted from him with special formalities. Though Montfort and the barons voiced the public discontent, the constitution which they thus imposed on the king had nothing popular about it. The royal functions of which Henry was stripped were to be exercised by a series of barons and councils, not always in accordance with the provisions, for there was nothing which would be called a central executive; the three bodies (two of twenty-four members each, the third of fifteen) were interdependent, and none of them possessed efficient control over the others. It was small wonder that the constitution established by the Provisions of Oxford was found unworkable. They were not even popular—the small landholders and subtenants discovered that their interests had not been sufficiently regarded, and lent themselves to an agitation against the provisional government, which was got up by Edward, the king’s eldest son, who now appeared prominently in history for the first time. Toconciliate them the barons allowed the “Provisions of Westminster” to be enacted in 1259, in which the power of feudal courts was considerably restricted, and many classes of suit were transferred to the royal tribunals, a sufficient proof that the king’s judges did not share in the odium which appertained to their master, and were regarded as honest and impartial.

The limited monarchy established by the Provisions of Oxford lasted only three years. Seeing the barons quarrelling among themselves, and that the royal finances were still in a bad way, the king took heart again. Copying the example of his father in 1213, he obtained from the pope a bull, which declared the new constitution irregular and illegal, and absolved him from his oath to abide by it. He then began to recall his foreign friends and relatives, and to assemble mercenaries. De Montfort answered by raising an army, arresting prominent aliens, and seizing the lands which the king had given them. Henry thereupon, finding his forces too weak to face the earl, took refuge in the Tower of London and proposed an arbitration. He offered to submit his case to Louis IX., the saintly king of France, whose virtues were known and respected all over Europe, if the baronial party would do the same. An appeal to the pope they would have laughed to scorn; but the confidence felt in the probity of the French king was so great that Montfort advised his friends to accede to the proposal. This was an unwise step. Louis was a saint, but he was also an autocratic king, and had no knowledge of the constitutional customs of England. Having heard the claims of the king and the barons, he issued the mise of Amiens (Jan. 23, 1264), so called from the place where it was drawn up, a document which stated that:

King Henry ought to abide by the terms of Magna Carta, to which he had so often given his assent, but that the Provisions of Oxford were wholly invalid and derogatory to the royal dignity. “We ordain,” he wrote, “that the king shall have full power and free jurisdiction over his realm, as in the days before the said Provisions.” The pope shortly afterwards confirmed the French king’s award.

Simon de Montfort and his friends were put in an awkward position by this decision, to which they had so unwisely
committed themselves. But they did not hesitate to declare that they must repudiate the mise. Simon declared that it would be a worse perjury to abandon his oath to keep the Provisions of Oxford than his oath to abide by the French king's word. He took arms again at the head of the Londoners and his personal adherents and allies. But many of the barons stood neutral, not seeing how they could refuse to accept the arbitration they had courted, while a number not inconsiderable joined the king, deciding that Leicester had passed the limits of reasonable loyalty, and that their first duty was to the crown.

Hence it came to pass that in the campaign of 1264 Simon was supported by a minority only of the baronial class, and the king's army was the larger. The fortune of war inclined at first in favour of the royalists, who captured Northampton and Nottingham. But when it came to open battle, the military skill of the earl sufficed to compensate for the inferiority of his numbers. At Lewes, on the 14th of May, he inflicted a crushing defeat on the king's army. Henry himself, his brother Richard of Cornwall, and many hundreds of his chief supporters were taken prisoners. His son Prince Edward, who had been victorious on his own flank of the battle, and had not been caught in the rout, gave himself up next morning, wishing to share his father's fate, and not to prolong a civil war which seemed to have become hopeless.

On the day that followed his victory Leicester extorted from the captive king the document called the "mise of Lewes," in which Henry promised to abide by all the terms of the Provisions of Oxford, as well as to uphold the Great Charter and the old customs of the realm. Montfort was determined to put his master under political tutelage for the rest of his life. He summoned a parliament, in which four knights elected by each shire were present, to establish the new constitution. It appointed Simon, with his closest allies, the young earl of Gloucester and the bishop of Chichester, as electors who were to choose a privy council for the king and fill up all offices which the king was to exercise no act of sovereignty save by the consent of the councillors, of whom three were to follow his person wherever he went. This was a far simpler constitution than that framed at Oxford in 1258, but it was even more liable to criticism. For if the "Provisions" had established a government by baronial committees, the parliament of 1264 created one which was a mere party administration. For the victorious faction, naturally but unwisely, took all power for themselves, and filled every sheriffdom, castellany and judicial office with their own firm friends. Simon's care to commit the commons to his cause by summoning them to his parliament did not suffice to disguise the fact that the government which he had set up was not representative of the whole nation. He himself was too much like a dictator; even his own followers complained that he was over-masterful, and the most important of them, the young earl of Gloucester, was gradually estranged from him by finding his requests often refused and his friends and retainers, as had been those of Henry, now sent on a commission. The fact that this government lasted less than two years, and was slowly losing prestige all the time. Its first failure was in the repression of the surviving royalists. Isolated castles in several districts held out in the king's name, and the whole March of Wales was never properly subdued. When Simon turned the native Welsh prince Llewelyn against the marcher barons, he gave great offence; he was accused of sacrificing Englishmen to a foreign enemy. The new régime did not give England the peace which it had promised; its enemies maintained that it did not even give the good governance of which Simon had made so many promises. It certainly appears that some of his followers, and notably his three rebellious sons, had given good cause for offence by high-handed and selfish acts. Much indignation was provoked by the sight of the king kept continually in ward by his privy councillors and treated with systematic neglect; but the treatment of his son was even more resented. Edward, though he had given little cause of offence, and had behaved admirably in refusing to continue the civil war, was deprived of his earldom of Chester; and put under the same restraint as his father.

There was no good reason for treating him so harshly, and his state was much pitied.

Montfort attempted to strengthen his position, and to show his confidence in the commons, by summoning to his second and last parliament, that of 1265, a new element—two citizens from each city and two burgesses from each borough in the realm. It must be confessed that his object was probably not to introduce a great constitutional improvement, and to make parliament more representative, but rather to compensate for the great gaps upon the baronial benches by showing a multitude of lesser adherents, for the towns were his firm supporters. The actual proceedings of this particular assembly had no great importance.

Two months later Prince Edward escaped from his confinement, and fled to the earl of Gloucester, who now declared himself a royalist. They raised an army, which seized the fords of the Severn, in order to prevent de Montfort—who was then at Hereford with the captive king—from getting back to London or the Midlands. The earl, who could only raise a trifling force in the Marches, where the barons were all his enemies, failed in several attempts to force a passage eastward. But his friends raised a considerable host, which marched under his son Simon the Younger and the earl of Oxford, to fall on the rear of the royalists. Prince Edward now displayed skilful generalship—hastily turning backward he surprised and scattered the army of relief at Kenilworth (Aug. 1); he was then free to deal with the earl, who had at last succeeded in passing the Severn during his absence. On the 4th of August he beset Montfort's little force with five-fold numbers, and absolutely exterminated it at Evesham. Simon fought most gallantly, and was left dead on the field along with his eldest son Henry, his justiciar Hugh Despenser, and the flower of his party. The king fell into the hands of his son's followers, and was once more free.

It might have been expected that the victorious party would now introduce a policy of reaction and autocratic government. But the king was old and broken by his late misfortunes; his son the prince was wise beyond his years, and Gloucester and many other of the present supporters of the crown had originally been friends of reform, and had not abandoned their old views. They had deserted Montfort because he was autocratic and masterful, not because they had altogether disapproved of his policy. Hence we find Gloucester insisting that the remnant of the vanquished party should not be subjected to over heavy punishment, and even making an armed demonstration, in the spring of 1267, to demand the re-enactment of the Provisions of Oxford. Ultimately the troubles of the realm were ended by the Dictum of Kenilworth (Oct. 31, 1266) and the Statute of Marlborough (Nov. 1267). The former allowed nearly all of Montfort's faction to obtain amnesty and regain their estates on the payment of heavy fines; only Simon's own Leicesters and those of Ferrers, earl of Derby, were confiscated. The latter established a form of constitution in which many, if not all, of the innovations of the Provisions of Oxford were embodied. The only unsatisfactory part of the pacification was that Llewelyn of Wales, who had ravaged the whole March while he was Montfort's ally, was allowed to keep a broad region (the greater part of the modern shire of Denbigh) which he had won back from its English holders. His power in a more indirect fashion extended itself over much of Mid-Wales. The line of the March was distinctly moved backward by the treaty of 1267.

King Henry survived his restoration to nominal, if not to actual, authority for seven years. He was now too feeble to indulge in any of his former freaks of foreign policy, and allowed the realm to be governed under his son's eye by veteran bureaucrats, who kept to the old customs of the land. Everything settled down so peacefully that when the prince took the cross, and went off to the Crusades in 1270, no trouble followed. Edward was still absent in Palestine when his father died, on the 16th of November 1272. For the first time in English history there was no form of election of the new king, whose accession was quietly acknowledged by the
officials and the nation. It was nearly two years after his father's death that he reached England, yet absolutely no trouble had occurred during his absence. He had taken advantage of his leisurely journey home to pacify the turbulent GASCONY, and to visit Paris and make a treaty with King Philip III, by which the frontiers of his duchy of Aquitaine were rectified, to some slight extent, in his favour. He, of course, did homage for the holding, as his father had done before him.

The reign which began with this unwonted quietness was perhaps the most important epoch of all English medieval history in the way of the definition and settlement of the constitution. Edward I. was a remarkable figure, by far the ablest of all the kings of the house of Plantagenet. He understood the problem that was before him, the construction of a working constitution from the old ancestral customs of the English monarchy plus the newer ideas that had been embodied in the Great Charter, the Provisions of Oxford, and the scanty legislation of Simon de Montfort. Edward loved royal power, but he was wise in his generation, and saw that he could best secure the loyalty of his subjects by assenting to so many of the new constitutional restraints as were compatible with his own practical control of the policy of the realm. He was prepared to refer all important matters to his parliament, and (as we shall see) he improved the shape of that body by reintroducing into it the borough members who had appeared for the first time in Montfort's assembly of 1265. He would have liked to make parliament, no doubt, a mere meeting for the voting of taxation with the smallest possible friction. But he fully realized that this dream was impossible, and was wise enough to give way, whenever opposition grew too strong and bitter. He had not fought through the civil wars of 1263-66 without learning his lesson. There was a point beyond which it was unwise to provoke the baronage or the commons, and, unlike his flighty and thriftless father, he knew where that point came. The constitutional quarrels of his reign were conducted with decency and temper because the king knew his own limitations, and was able to dispose of his subjects' trust in his wisdom and moderation in times of crisis. Edward indeed was a man worthy of respect, if not of affection. His private life was grave and seemly, his court did not sin by luxury or extravagance. His chosen ministers were wise and experienced officials, whom no man could call favourites or accuse of maladministration. He was sincerely religious, self-restrained and courteous, though occasionally, under provocation, he could burst out into a royal rage. He was a good master and a firm friend. Moreover, he had a genuine regard for the sanctity of a promise, the one thing in which his father had been most wanting. It is true that sometimes he kept his oaths or carried out his pledges with the literal punctuality of a lawyer, rather than with the chivalrous generosity of a knight. But at any rate he always endeavoured to discharge an obligation, even if he sometimes interpreted it by the strict letter of the law and not with liberality.

As a natural consequence of his rights, he took as his device the motto PACTUM serva, "keep troth," which was afterwards inscribed on his tomb, and did his best to live up to it. Naturally he expected the same accuracy from other men, and when he did not meet it he could be harsh and unrelenting in the punishment that he inflicted. To sum up his character it must be added that he was a very great soldier. The headlong courage which he showed at Lewes, his first battle, was soon tempered by caution, and already in 1265 he had shown that he could plan a campaign with skill. In his later military career he was the first general who showed on a large scale how the national English weapon, the bow, could win fights when properly combined with the charge of the mailed cavalry. He inaugurated the tactics by which his grandson and great-grandson were to win epoch-making victories abroad.

Edward's reign lasted for thirty-five years, and was equally important in constitutional development and in imperial policy. The first period of it, 1272-1300, may be defined as mainly notable for his great series of legislative enactments and his conquest of Wales. The second, 1290-1307, contains his long and ultimately unsuccessful attempt to incorporate Scotland into his realm, and his quarrels with his parliament. The changes made by Edward in constitutional law by his great series of statutes commenced very soon after his return to his kingdom in 1274. We may trace in all of them the same purpose of strengthening the power of the crown by judicial and orderly definition of its privileges. The great enactments start with the First Statute of Westminster (1275), a measure directed to the improvement of administrative details, which was accompanied by a grant to the king of a permanent customs-revenue on imports and exports, which soon became more valuable to the royal exchequer than the old feudal taxes on land. In 1278 followed the Statute of Gloucester, an act empowering the king to make inquiry as to the right by which old royal estates, or exceptional franchises which infringed on the royal prerogative of justice or taxation, had passed into the hands of their present owners. This inquest was made by the writ Quo Warranto, by which each landholder was invited to show the charter or warrant in which his claims rested. The baronage were angry and suspicious, for many of their customary rights rested on immemorial and unchartered antiquity, while others were usurpations from the weakness of John or Henry III. They showed signs of an intention to make open resistance; but to their surprise the king contented himself with making complete lists of all franchises then existing, and did no more; this being his method of preventing the growth of any further trespasses on his prerogative.

Edward's next move was against clerical encroachments. In 1279 he compelled Archbishop Peckham to withdraw some legislation made in a synod called without the royal permission—a breach of one of the three great canons of William the Conqueror. Then he took the offensive himself, by persuading his parliament to pass the Statute of Mortmain to curb and harass the monks and nuns who were gathering land by the accumulation of landed property in the "dead hand " of religious persons and communities. The more land the church acquired, the less feudal taxation came into the royal exchequer. For undying corporations paid the king neither "reliefs" (death duties) nor fees on wardship and marriage, and their property would never escheat to the crown for want of an heir. The Statute of Mortmain forbade any man to alienate land to the church without royal licence. It was very acceptable to the baronage, who had suffered, on a smaller scale, the same grievance as the king, for when their subtenants transferred estates to the church, they (like their masters) suffered a permanent loss of feudal revenue. A distinct check in the hitherto steady growth of clerical endowments began from this time, though licences in mortmain were by no means impossible to obtain.

The great group of statutes that date from Edward's earlier years ends with the legislative enactments of 1285, the Second Statute of Westminster and the Statute of Winchester. The former contains the clause De Donis Conditionalibus, a notable landmark in the history of English law, since it favoured the system of entailing estates. Hitherto life-owners of land, holding as subtenants, had possessed large powers of alienating it, to the detriment of their superior lords, who would otherwise have recovered it, when their vassals died heirless, as an "escheat." This custom was primarily harmful to the king—the greatest territorial magnate and the one most prone to distribute rewards in land to his servants. But it was also prejudicial to all tenants-in-chief. By De Donis the tenant for life was prevented from selling his estate, which could only pass to his lawful heir; if he had none, it fell back to his feudal superior. Five years later this legislation was supplemented by the statute Quia Emptores, equally beneficial to king and barons, which provided that subtenants should not be allowed to make over land to other persons, retaining the nominal possession and feudal rights over it, but should be compelled to sell it out and out, so that their successor in title stood to the overlord exactly as the seller had done. Hitherto
they had been wont to dispose of the whole or parts of their estates while maintaining their feudal rights over it, so that the ultimate landlord could not deal directly with the new occupant, whose rights, warship, &c., fell to the intermediate holder who had sold away the land. The main result of this was that, when a house was purchased with any one of his estates, the acquirer became a tenant-in-chief directly dependent on the king, instead of being left a vassal of the person who had passed over the land to him. Subtenure came to a complete stop, and whenever great family estates broke up the king obtained new tenants-in-chief. The number of persons holding immediately of the crown began at once to multiply by leaps and bounds. As the process of the partition of lands continued, the fractions grew smaller and smaller, and many of the tenants-in-chief were ere long very small and unimportant persons. These, of course, would not form part of the baronial interest, and could not be distinguished from any other subjects of the crown.

The Statute of Winchester, the other great legislative act of 1285, was mainly concerned with the keeping of the peace of the realm. It revised the arming and organization of the national militia, the lineal descendant of the old fyrd, and provided a useful police force for the repression of disorder and robbery by the reorganization of watch and ward. This was, of course, one more device for strengthening the power of the crown.

In the intervals of the legislation which formed the main feature of the first half of his reign, Edward was often distracted by external matters. He was, on the whole, very good terms with his first cousin, Philip III. of France; the trouble did not come from this direction, though there was the usual crop of feudal rebellions in Gascony. Nor did Edward's relations with the more remote states of the continent lead to any important results, though he had many treaties and alliances in hand. It was with Wales that his most troublesome relations occurred. Llewelyn-ap-Gruffydd, the old ally of de Montfort, had come with profit out of the civil wars of 1263–66, and having won much land and more influence during the evil days of Henry III., was reluctant to see that his time of prosperity had come to an end, now that a king of a very different character sat on the English throne.

Frustration began the moment that Edward returned to his kingdom from the crusade. Llewelyn would not deign to appear before him to render the customary homage due from Wales to the English crown, but sent a servant to the king, who evaded him by his sly duplicity and drove his recalcitrant vassal up into the fastnesses of Snowden, where famine compelled him to surrender as winter was beginning. Llewelyn was pardoned, but deprived of all the lands he had gained during the days of the civil war, and restricted to his own North Welsh dominions. He remained quiescent for five years, but busied himself in knitting up secret alliances with the Welsh of the South, who were resenting the introduction of English laws and customs by the strong-handed king. In 1282 there was a sudden and well-planned rising, which extended from the gates of Chester to those of Carmarthen; several castles were captured by the insurgents, and Edward had to come to the rescue of the lords-marchers at the head of a very large army. After much checkered fighting Llewelyn was slain at the skirmish of Owain Bridge near Builth on the 11th of December 1282. On his death the southern rebels submitted, but David his brother continued the struggle for three months longer in the Snowdon district, till his last bands were scattered and he himself taken prisoner. He beheaded him at Shrewsbury as a traitor, having the assurance that David had submitted once before, had been endowed with lands in the Marches, and had nevertheless joined his brother in rebellion. After this the king abode for more than a year in Wales, organizing the newly conquered principality into a group of counties, and founding many castles, with dependent towns, within its limits. The "statute of Wales," issued at Rhuddlan in 1284, provided for the introduction of English law into the country, though a certain amount of Celtic customs was allowed to survive. For the next two centuries and a half the lands west of Dee and Wye were divided between the new counties, forming the "principality" of Wales, and the "marches" where the old feudal franchises continued, till the marcher-lordships gradually fell by forfeiture or marriage to the crown. Edward's grip on the land was strong, and it had need to be so, for in 1287 and 1294–1295 there were desperate and widespread revolts, which were only checked by the existence of the new castles, and subdued by the concentration of large royal armies. In 1301 the king's eldest surviving son Edward, who had been born at Carnarvon in 1284, was created "prince of Wales," and invested with the principality, which henceforth became the regular appanage of the heirs of the English crown. This device was apparently intended to soothe Welsh national pride, by reviving in form, if not in reality, the separate existence of the old Cymric state. For four generations the land was comparatively quiet, but the great rebellion of Owen Glendower in the reign of Henry IV. was to show how far the spirit of particularism was from extinction.

Some two years after his long sojourn in Wales Edward made an even longer stay in a more remote corner of his dominions. Greatly vexed as usual, out of hand, he crossed to Bordeaux in 1286, and abode in Guienne for no less than three years, reducing the duchy to such order as it had never known before, settling all disputed border questions with the new king of France, Philip IV., founding many new towns, and issuing many useful statutes and ordinances. He returned suddenly in 1289, called home by complaints that reached him as to the administration of justice by his officials, who were slighting the authority of his cousin Edmund of Cornwall, whom he had left behind as regent. He dismissed almost the whole bench of judges, and made other changes among his ministers. At the same time he fell fiercely upon the great lords of the Welsh Marches, who had been indulging in private wars; when they returned to their evil practice he imprisoned the chief offenders, the earls of Hereford and Gloucester, forfeited their estates, and only gave them back when they had paid vast fines (1291). Another act of this period was Edward's celebrated expulsion of the Jews from England (1290). This was the continuation of a policy which he had already carried out in Guienne. It would seem that his reasons were partly religious, but partly economic. No earlier king could have afforded to drive forth a race who had been so useful to the crown as bankers and money-lenders; but by the end of the 13th century the financial monopoly of the Jews had been broken by the great Italian banking firms, whom Edward had been already employing during his Welsh wars. Finding them no less accommodating than their rivals, he gratified the prejudices of his subjects and himself by forcing the Hebrews to quit England. The Italians in a few years became as unpopular as their predecessors in the trade of usury, their practices being the same, if their creed was not.

Meanwhile in the same year that saw the expulsion of the Jews, King Edward's good fortune began to wane, with the rise of the Scottish question, which was to overshadow the latter half of his reign. Alexander III., the last male in direct descent of the old Scottish royal house, had died in 1286. His heir was his only living descendant, a little girl, the child of his deceased daughter Margaret and Eric, king of Norway, his father. After much discussion, for both the Scottish nobles and the Norse king were somewhat suspicious, Edward had succeeded in obtaining from them a promise that the young queen should marry his heir, Edward of Carnarvon. This wedlock would have led to a permanent union of the English and Scottish crowns, but not to an absorption of the lesser in the greater state, for the rights of Scotland were carefully guarded in the marriage-treaty. But the scheme was wrecked by the premature death of the bride, who expired by the way, while being brought over from Norway to her own kingdom, owing to privations and fatigue suffered on a tempestuous voyage.
English History

[1286-1295]

She had no near relatives, and more than a dozen Scottish or Anglo-Scottish nobles, distantly related to the royal line, put in had one out of the crown, and thus to a part of the royal heritage. The board of six regents, who had been ruling Scotland for the young king, seeing their own power at an end and civil war likely to break out, begged Edward of England to arbitrate between the claimants. The history of the next twenty years turned on the legal point whether the arbitrator acted—as he himself contended—in the capacity of suzerain, or—as the Scots maintained—in that of a neighbour of acknowledged wisdom and repute, invited to settle a domestic problem. This question of the relations between the English and the Scottish crowns had been raised a dozen times between the days of Edward the Elder and those of Henry III. There was no denying the fact that the northern kings had repeatedly done homage to their greater neighbours. But, save during the years when William the Lion, after his capitulation, had owned himself the vassal of Henry II. for all his dominions, there was considerable uncertainty as to the exact scope of the allegiance which had been demanded and given. And William's complete submission had apparently been cancelled, when Richard I sold him in 1189 to the Pope as a hostage for the execution of the peace of Falaise. Since that date Alexander II and Alexander III had repeatedly owned themselves vassals to the English crown, and had even sat in English parliaments. But it was possible for patriotic Scots to contend that they had done so only in their capacity as English barons—for they held much land south of Tweed—and to point to the similarity of their position to that of the English king when he did homage for his duchy of Guinevere at Paris, without thereby admitting any suzerainty of the French crown over England or Ireland. On the last occasion when Alexander III had owned himself the vassal of Edward I, there had been considerable fencing on both sides as to the form of the oath, and, as neither sovereign at the moment had wished to push matters to a rupture, the words used had been intentionally vague, and both parties had kept their private interpretations to themselves. But now, when Edward met the Scottish magnates, who had asked for his services as arbitrator, he demanded that they should acknowledge that he was acting in suzerain and overlord of the whole kingdom of Scotland. After some delay, and with manifest reluctance, the Scots complied; their band was forced by the fact that most of the claimants to the crown had hastened to make the acknowledgment, each hoping thereby to prejudice the English king in his own favour.

This submission having been made, Edward acted with honesty and fairness, handing over the adjudication to a body of eighty Scottish and twenty-four English barons, knights and bishops. These commissioners, after ample discussion and taking of evidence, adjudged the crown to John Baliol, the grandson of the eldest daughter of Earl David, younger brother of William the Lion. They ruled out the claim of Robert Bruce, the son of David's second daughter, who had raised the plea that his descent was superior because he was a generation nearer than Baliol to their common ancestor. This theory of affinity had been well known in the 12th century, and had been urged in favour of King John when he was contending with his nephew Arthur. But by 1291 it had been definitely settled by the most important of the Angevin expeditions, and the case of the Scottish succession was decided in declaring Baliol their rightful king. Edward at once gave him seizin of Scotland, and handed over to him the royal castles, which had been placed in his hands as a pledge during the arbitration. In return Baliol did him homage as overlord of the whole kingdom of Scotland.

This, unfortunately, turned out to be the beginning, not the end, of troubles. Edward was determined to exact all the ordinary feudal rights of an overlord—whatever might have been the former relations of the English and Scottish crowns. The Scots, on the other hand, were resolved not to allow of the introduction of usages which had not prevailed in earlier times, and to keep the tie as vague and loose as possible. Before Baliol had been many months on the throne there was grave friction on the question of legal appeals. Scottish litigants defeated in the local courts began to appeal to the courts of Westminster, just as Gascon litigants were wont to appeal from Bordeaux to Paris. King John and his baronage, relying on the fact that such a practice on the part of the English was unknown, refused to allow that it was valid. King Edward insisted that by common feudal usage it was perfectly regular, and announced his intention of permitting it. Grave friction had already begun when external events precipitated an open rupture between the king of England and his new vassal.

Philip III. of France, who had always pursued a friendly policy with his cousin of England, had died in 1285, and had been succeeded by his son Philip IV., a prince of a very different type, the most able and unscrupulous of all the dynasty of Capet. In 1294 he played a most dishonourable trick upon King Edward. There had been some irregular and piratical fighting at sea between English and Norman sailors, in which the latter had been worsted. When called to account for the doings of his subjects, as well as for certain disputes in Gascony, the English king promised redress, and, on the suggestion of Philip, surrendered, as a formal act of apology, the six chief fortresses of Guienne, which were to be restored when reparation had been made. Having been imprisoned, Philip suddenly changed his mind, refused to continue the negotiations, and declared the whole duchy forfeited. Edward was forced into war, after having been tricked out of his strongholds. Just after his first successes had sailed for the Gironde, the great Welsh rebellion of 1294 broke out, and the king was compelled to turn aside to repress it. This he accomplished in the next spring, but meanwhile hardly a foot- hold remained to him in Gascony. He was then preparing to cross the Channel in person, when Scottish affairs began to become threatening. King John declared himself unable to restrain the indignation of his subjects at the attempt to enforce English suzerainty over Scotland, and in July 1295 leagued himself with Philip of France, and expelled from his realm the chief supporters of the English alliance. Finding himself involved in two wars at once, Edward made an earnest appeal to his subjects to rise to the occasion and "because that which touches all should be approved of all" summoned the celebrated "model parliament" of November 1295, which exactly copied in its constitution Montfort's parliament of 1265, members from all cities and boroughs being summoned along with the knights of the shires, and the inferior clergy being also represented by their proctors. This system henceforth became the normal one, and the English parliament assumed its regular form, though the differentiation of the two houses was not fully completed till the next century. Edward was voted liberal grants by the laity, though the clergy gave less than he had hoped; but enough money was obtained to fit out two armies, one destined for the invasion of Scotland, the other for that of Gascony.

The French expedition, which was led by the king's brother Edmund, earl of Lancaster, failed to recover Gascony, and came to an ignominious end. But Edward's own army achieved complete success in Scotland. Berwick was stormed, the Scottish army was routed at Dunbar, and the king was captured. In the same year a large part of the kingdom of Scotland was taken, and at last John Baliol, deserted by most of his adherents, surrendered at Brechin. Edward pursued his triumphant march as far as Aberdeen and Elgin, without meeting further resistance. He then summoned a parliament at Berwick, and announced to the assembled Scots that he had determined to depose King John, and to assume the crown himself. The ease with which he had subdued the realm misled him; he fancied that the slack resistance, which was mainly due to the incapacity and unpopularity of Baliol, implied the indifferance of the Scots to the idea of annexation. The alacrity with which the greater part of the baronage flocked in to do him homage confirmed him in the mistaken notion. He appointed John, earl Warenne, lieutenant of the realm, with Hugh Cressingham, an English clerk, as treasurer, but left nearly all the minor offices in Scottish hands, and announced that Scottish law should be administered.
He then returned to England, and began to make preparations for a great expedition to France in 1297.

His plan was something more ambitious than a mere attempt to recover Bordeaux; succours were to go to Gascony, but he himself and the main army were to invade France from the north with the aid of the count of Flanders. Much money was, of course, needed for the double expedition, and in raising it Edward became involved in two desperate constitutional disputes. Though the barons and the commons voted a liberal grant at the parliament of Bury (Nov. 1296) the clergy would give nothing. This was owing to a bull—the celebrated Clerici Laiici, recently issued by the arrogant and contentious pope Boniface VIII., which forbade the clergy to submit to any taxation by secular princes. Robert Winchelsey, the archbishop of Canterbury, an enthusiastic exponent of clerical rights and grievances, declared himself in conscience bound to obey the pontiff, and persuaded the representatives of the Church in the parliament to refuse supplies. The king, indignant that an attempt should be made to exempt the vast ecclesiastical lands from taxation at a time of national crisis, sequestrated the estates of the see of Canterbury, and copied John’s conduct in 1208 by outlawing the whole body of the clergy. Winchelsey in return excommunicated all those who refused to recognize the authority of the pope’s bull.

Scarcely was this quarrel developed when Edward found himself involved in an equally hot dispute with the commons and the baronage. In his eagerness to collect the sinews of war he had issued orders for the levy of a heavy custom duties on wool, the main export of the land, and in some cases laid hands on the wool itself, which lay ready for shipping; though this had not been granted him by the late parliament. The “mal-tolt”—or illegal tax—as his subjects called it, provoked the anger of the whole body of merchants in England. At the same time the barons, headed by the earls of Norfolk and Hereford, raised the old grievance about feudal service beyond seas, which had been so prominent in the time of King John. Norfolk, who had been designated to lead the expedition to Guinée, declared that though he was ready to follow his master to Flanders in his capacity of marshal, he would not be drafted off to Gascony against his own will. Hereford and a number of other barons gave him hearty support.

Harassed by these domestic troubles, the king could not carry out his intention of sailing for Flanders in the spring, and spent the greater part of the following campaigning season in wrangles with his subjects. He was obliged to come to a compromise. If the clergy would give him a voluntary gift, which was in no way to be considered a tax, he agreed to inlaw them. They did so, and even Winchelsey, after a time, was reconciled to his master. As to the barons, the king took the important constitutional step of concealing that he would not ask them to serve abroad as a feudal obligation, but would pay them for their services, if they would oblige him by joining his banner. Even then Norfolk and Hereford refused to sail; but the greater part of the minor magnates contented to serve as stipendiaries. The commons were conciliated by a promise that the wool which the royal officers had seized should be paid for, when a balance was forthcoming in the exchequer.

By these means Edward succeeded at last in collecting a considerable army, and sailed for Flanders at the end of August. But he was hardly gone when dreadful news reached him from Scotland. An insurrection, to which no great importance was attached at first, had broken out in the summer. Its first leader was none of the great barons, but a Renfrewshire knight, Sir William Wallace, a more long-lasting popular hero, including Robert Bruce, earl of Carrick (grandson of Robert Bruce of Annandale, one of the competitors for the crown of Scotland), and the bishop of Glasgow, were found to be in communication with the rebels. Earl Warenne, the king’s lieutenant in Scotland, mustered his forces to put down the rising. On the 1st of September 1297 he attempted to force the passage of the Forth at Stirling Bridge, and was completely beaten by Wallace, who allowed half the English army to pass the river and then descended upon it and annihilated it, while Warenne looked on helplessly from the other bank. Almost the whole of Scotland rose in arms on hearing of this victory, but the barons showed less zeal than the commons, owing to their jealousy of Wallace. Warenne retired to Berwick and besought his master for aid.

Edward, who was just commencing an autumn campaign in Flanders which was to lead to no results, sent home orders to summon a parliament, which should raise men and money for the Scottish war. It was called, and made a liberal grant for that purpose, but Archbishop Winchelsey and the earls of Norfolk and Hereford took advantage of their master’s needs, and of his absence, to assert themselves. Taking up the position of defenders of the constitution, they induced the parliament to couple its grants of money with the condition that the king should not only confirm Magna Carta—as had been so often done before—but give a specific promise that no “mal-tolt,” or other taxes not legally granted him, should be raised for the future. Edward received the petition at Ghent, and made the required oath. The document to which he gave his assent, the Conformatio Cartarum (essentially the same as the statute De Talloquo non concedendo) marked a distinct advance beyond the theories of Magna Carta; for the latter had been drawn up before England possessed a parliament, and had placed the control of taxation in the hands of the old feudal council of tenants-in-chief, while the Conformatio gave it to the assembly, far more national and representative, which had now superseded the Great Council as the mouthpiece of the whole people of the realm.

The Scottish revolt had become so formidable that Edward was compelled to abandon his unfruitful Flemish campaign; he patched up an unsatisfactory truce with the king of France, which left four-fifths of his lost Gascon lands in the power of the enemy, and returned to England in the spring of 1298. In July he invaded Scotland at the head of a formidable army of 15,000 men, and on the 22nd of that month brought Wallace to action on the moors above Falkirk. The steady Scottish infantry held their own for some time against the charge of the English men-at-arms. But when Edward brought forward his archers to aid his cavalry, as William I. had done at Hastings, Wallace’s columns broke up, and a dreadful slaughter followed.

The impression made on the Scots was so great that for some years they refused to engage in any pitched battle. But the lack of immediate consequences was not all that might have been expected. Edward was able to occupy many towns and castles, but the broken bands of the insurgents lurked in the hills and forests, and the countryside as a whole remained unsubdued. Wallace went to France to seek aid from King Philip, and his place was taken by John Comyn, lord of Badenoch, a nephew of Batiol, who was a more acceptable leader to the Scottish nobles than the vanquished knight of Falkirk. Edward was detained in the south for a year, partly by negotiations with France, partly by a renewed quarrel with his parliament, and during his absence Comyn recovered Stirling and most of the other places which had received English garrisons. It was not till 1300 that the king was able to resume the invasion of Scotland, with an army raised by grants of money that he had only bought by humiliating concessions to the will of his parliament, formulated in the Articulis super cartas which were drawn up in the March of that year. Even then he only succeeded in recovering some border holds, and the succeeding campaign of 1301 only took him as far as Linlithgow. But in the following year his position was suddenly changed by unexpected events abroad; the king of France became involved in a desperate quarrel with the pope, and at the same moment his army received a crushing defeat before Courtrai at the hands of the Flemings. To free himself for these new struggles Philip made up his mind to conclude peace with England, and even at the cost of sacrificing his conquests in Gascony. Bordeaux had already revolted from him, and he gave up the rest of his ill-gotten gains of 1294 by the treaty of Paris (May 20, 1303).
Now that he had only a single war upon his hands Edward's position was entirely changed. There was no more need to conciliate the magnates nor the parliament. His displeasure fell mainly on the archbishop and the earl of Norfolk, who had so long led the opposition. Winchelsea was put in disgrace, and ultimately exiled. Norfolk, who was childless, was forced to sign a grant by which his lands went to the king after his death—a harsh and illegal proceeding, for he had collateral heirs. But the Scots, as was natural, bore the brunt of the king's wrath. In June 1303, a month after the peace of Paris, he advanced from Roxburgh, determined to make a systematic conquest of the realm, and not to return till it was ended. He kept up his campaign throughout the winter, reduced every fortress that held out, and carried his arms as far as Aberdeen and Elgin. In February 1304 the regent Comyn and most of the Scottish baronage submitted, on the promise that they should retain their lands on doing homage. Wallace, who had returned from France, kept up a guerrilla warfare in the hills for a year more, but was captured in July 1305, and sent to London to be executed as a traitor. Even before his capture he seems to have been thoroughly tamed, and it is supposed that before the fate of Wales the arrangements for the administration of the conquered kingdom were wise and liberal, if only the national spirit of the Scots could have tolerated them. The Scottish parliament was to continue, though representatives from beyond Tweed were also to be sent to the English parliament. The sheriffs and most of the ministerial posts were left in the hands of Scots, though the supreme executive authority was put in the hands of John of Brittany, earl of Richmond, the king's nephew. The land seemed for a time to be settling down, and indeed the baronage were to such a large extent English in both blood and feeling, that there was no insuperable difficulty in conciliating them. A considerable fraction of them adhered consistently to the English cause from this time forth, and ultimately lost their lands for refusing to follow the rest of the nation in the next insurrection.

But the delusion that Scotland had been finally subdued was to last only for a year, although in 1305 Edward seemed to have accomplished his task, and stood triumphant, with the northern realm at his feet, his domestic foes humbled, and France and the papacy subdued. His last short interval of peaceful rule was distinguished by the passing of the Statute of Trailblazon in the parliament of 1305. This was a measure for the repression of local riots, empowering justices in every shire to suppress clubs (trailblazons), gangs of marauders who had been rendering the roads unsafe.

In the first month of 1306, however, the weary Scottish war broke out again, with the appearance of a new insurgent chief. Robert Bruce, earl of Carrick, grandson of the claimant to the throne of 1292, had hitherto pursued a shifty policy, waverling between submission and opposition to the English invader. He had been in arms more than once, but had finally adhered to the pacification of 1304, and was now entirely trusted by the king. But he was secretly plotting rebellion, disguised (as it would seem) that Edward had not suffered the crown of Scotland to the line of Bruce when the house of Balliol was found wanting. Though he found himself certain of a considerable amount of support yet he could not that there would be no general rising in his favour, for many of the magnates refused to help in making king a baron whom they regarded as no more important than one of themselves. But the insurrection was precipitated by an unmeditated outrage. Bruce was conferring at Dumfries with John Comyn, the late regent, whom he was endeavouring to tempt into his plots, on the 10th of January 1306. An angry altercation followed, for Comyn would have nothing to do with the scheme, and Bruce and his followers finally slew him before the altar of a church into which he had fled. After this crime, which combined the disgrace of sacrilege with that of murder under stry, Bruce was forced to take arms at once, though his preparations were incomplete. He raised his banner, and was hastily crowned at Scone on the 25th of March; by that time the rising had burst out in many shires of Scotland, but it was neither unanimous nor complete. Edward by no means despaired of crushing it, and had raised a large army, when he was smitten with an illness which prevented him from crossing the border. But his troops, under Aymer de Valence, earl of Pembroke, pressed north, and surprised and routed Bruce at Methven near Perth. The pretender's brother Nigel and many of his chief supporters were taken prisoners, and he himself escaped with a handful of followers and took refuge in the Western islands. Edward ordered young Nigel Bruce and many other captives to be executed; for he was provoked to great wrath by the rebellion of a magnate who had given him every assurance of loyalty. He intended to follow de Valence to Scotland, and to complete the suppression of the rising in person. But this proved beyond his strength; he struggled as far as the border in July, but could not shake off his disease, and was forced to linger, a broken invalid, in the neighbourhood of Carlisle for many months. Meanwhile his lieutenants failed to follow up with energy the victory gained at Methven, and in the next spring Bruce appeared in the Lowlands, gathered new levies, and inflicted a decisive victory on the king. Roused to anger by Edward's refusal to enlarge King Edward rose from his bed, mounted his horse, and started for Scotland. But after struggling on for a few miles he fell by the way, and died at Burgh-on-Sands, just inside the English border, on the 7th of July 1307.

Despite the chequered fortunes of his later years the reign of Edward had been a time of progress and prosperity for England. He had given his realm good and strong governance; according to his lights he had striven to keep faith and truth, and to observe his coronation oath. He had on more than one occasion quarrelled with his subjects, but matters had never been pushed to an open rupture. The king knew how to yield, and even opponents like Winchelsea and the earls of Norfolk and Hereford respected him too much to drive him to an extremity. The nation, however much it might murmur, would never have been willing to rebel against a sovereign whose only fault was that he occasionally pressed his prerogative too far. Edward's rule was seldom or never oppressive, the seizure of the merchants' wool in 1297 was the only one of his acts which caused really fierce and widespread indignation. For his other arbitrary proceedings he had some show of legal justification in every case. It would have been absurd to declare that his rule was tyrannical or his policy disastrous. The realm was on the whole contented and even flourishing. Population was steadily increasing, and with it commerce; the intellectual activity which had marked the reign of Henry III. was still alive; architecture, religious and military, was in its prime. He was himself a great builder, and many of the perfected castles of that concentric style, which later ages have called the "Edwardian type," were of his own planning. In ecclesiastical architecture his reign represents the early flower of the "Decorated" order, perhaps the most beautiful of all the developments of English art. In many respects the reign may be regarded as the culmination and crowning point of the middle ages. It certainly gave a promise of greatness and steady progress which the 14th century was far from justifying. With the great king's death a sudden change for the worse was visible. The individual character of the reigning king was still the main factor in political history, and Edward II. was in every respect a contrast to his father. He was incorrigibly frivolous, idle and apathetic; his father had given him much stern schooling, but this seems only to have inspired him with a deeply rooted dislike for official work of any kind. He has been well described as "the first king since the Conquest who was not a man of business." Even Stephen and Henry III. had been active and bustling princes, though their actions were misguided and inconsequent. But Edward II. hated all kingly duties; he detested war, but he detested even more the routine work of administration. He was most at his ease in low company, his favourite diversion was gambling, his best trait a love for farming and the mechanical arts of the smith and the gardener.
His first acts on coming to the throne caused patriotic Englishmen to despair. His father, on his deathbed, had made him swear to conduct the Scottish expedition to its end. But he marched no further than Dumfries, and then turned back, on the vain pretext that he must conduct his parent's funeral in person. Leaving Bruce to gather fresh strength and to commence the tedious process of reducing the numerous English garrisons in Scotland, he betook himself to London, and was not seen on the border again for more than three years. He then dismissed all his father's old ministers, and replaced them by creatures of his own, for the most part persons of complete incompetence. But his most offensive act was to promote to the position of chief councilor of the crown, and dispenser of the royal favours, a clever but vain and ostentatious Gascon knight, one Piers Gaveston, who had been the companion of his boyhood, and had been banished by Edward I. for encouraging him in his follies and frivolity. Piers was given the royal title of earl of Cornwall, and married to the king's niece; when Edward went over to France to do homage for Gascony, he even made his friend regent during his absence, in preference to any of his kinsmen. It was his regular habit to refer those who came to him on matters of state to "his good brother Piers," and to refuse to discuss them in person.

It was of course impossible that the nation or the barony should accept such a preposterous régime, and Edward was soon involved in a lively struggle with his subjects. Of the leaders of opposition in his father's reign both hereford and norfolk were now dead. But archbishop winchester had returned from exile in a beligerent mood, and the place of Norfolk and Hereford was taken by an ambitious prince of the royal house, thomas, earl of lancaster, the son of the younger brother of Edward I. Thomas was selfish and incompetent, but violent and self-assertive, and for some years was able to pose successfully as a patriot simply because he set himself to oppose every act of the unpopular king. He had several powerful baronial allies—the earls of Warwick, Pembroke and warrene, with Humphrey Bohun of Hereford, who had succeeded to his father's politics, though he had married the king's own sister. The annals of the early years of Edward II. are mainly filled by contemporary chronicles with details of the miserable strife between the king and his barons on the question of Gaveston's unconstitutional position. But the really important feature of the time was the gradual reconquest of Scotland by Robert Bruce, during the continuance of the domestic strife in England. Edward I. had laid such a heavy hand on the northern nation that it required twenty years to undo his work. A very large proportion of the Scottish nobility regarded Bruce as a usurper who had opened his career with murder and sacrilege, and either openly opposed him or denied him help. His resources were small, and it was only by constant effort, often chequered by failures, that he gradually fought down his local adversaries, and reduced the English garrisons one by one. Dunbarton and Linlithgow were only mastered in 1312. Perth did not finally fall into his hands till 1313; edinburgh, Roxburgh and stirling were still holding out in 1314. During all this time the English king only once went north of the border— in 1311—and then with a very small army, for lancaster and his friends had refused to join his banner. Yet even under such conditions Bruce had not to retire to the mountains, and to allow the invaders to range unopposed through lothian and fife, and even beyond the tay. With ordinary capacity and perseverance Edward II. might have mastered his enemy; indeed the comyns and umfravilles and other loyalist barons of Scotland would have carried out the business for him, if only he had given them adequate support. But he spent what small energy he possessed in a wretched strife of chicanery and broken promises with thomas of lancaster and his party, dismissing and recalling Gaveston according to the exigencies of the moment, while he left the Scottish war shift for itself. It must be confessed that the conduct of his adversaries was almost as contemptible and unpatriotic. They refused to aid in the war, as if it was the king's private affair and not that of the nation. And repeatedly, when they had Edward at their mercy and might have dictated what terms they pleased to him, they failed to rise to the situation. This was especially the case in 1311, when the king had completely submitted in face of their armed demonstrations. Instead of introducing any general scheme of reform they contented themselves with putting him under the tutelage of twenty-one "lords ordinaires," a baronial committee like that which had been appointed by the provisions of Oxford, fifty years back. Edward was not to levy an army, appoint an official, raise a tax, or quit the realm without their leave. He had also to swear an obedience to a long string of constitutional limitations of his power, and to promise to remove many practical grievances of administration. But there were two great faults in the proceedings of Thomas of Lancaster and his friends. The first was that they ignored the rights of the commons—save indeed that they got their ordinances confirmed by parliament—and put all power into the hands of a council which represented nothing but the baronial interest. The second, and more fatal, was that this council of " ordinaries," when installed in office, showed energy in nothing save in persecuting the friends of Edward and Gaveston; it neglected the general welfare of the realm, and in particular made no effort whatever to end the Scottish war. It was clearly their duty either to make peace with Robert Bruce, or to exert themselves to crush him; but they would do neither.

Gaveston's unhappy career came to an end in 1312. After he had been twice exiled, and had been twice recalled by the king, he was besieged in scarborough and captured by the earl of Pembroke. He was being conducted to London to be tried in parliament, when his two greatest enemies, thomas of Lancaster and Guy, earl of warwick, took him out of the hands of his escort, and beheaded him by the wayside without any legal authority or justification. The unhappy king was compelled to promise to forget and forgive this offence, and was then restored to a certain amount of freedom and power; the barons believed that when freed from the influence of Gaveston he would prove a less unsatisfactory sovereign. The experiment did not turn out happily. Bruce having at last made an almost complete end of the English garrisons within his realm, laid siege to stirling, the last and strongest of them all, in the spring of 1313. Compelled by the pressure of public opinion to attempt its relief, Edward crossed the border in June 1314, with an army of 20,000 foot and 4000 men-at-arms. He found Bruce prepared to dispute his advance on the hillside of Bannockburn, 2 m. in front of stirling, in a strong position with a stream in front and his flanks covered by rows of pikes, to the top of the hillside, and even actually dug several ditches for its defence. Bruce, as at Falkirk, were ranged in solid clumps of pikemen above the burn, with only a small reserve of horse. The English king, forgetting his father's experiences, endeavoured to ride down the enemy by headlong frontal charges of his men-at-arms, and made practically no attempt to use his archery to advantage. After several attacks had been beaten off with heavy loss, the English host recoiled in disorder and broke up—the king, who had kept in the rear all day, was one of the first to move off. The flower of his knights had fallen, including his nephew, the Earl of Gloucester, who was the only one of the great magnates of the realm who had shown loyalty to him during the last six years. The Scots also made many prisoners; the disaster was complete, and the wrecks of the beaten army dispersed before returning the border. Edward spent the autumn in ravaging Northumberland and Cumberland.

Thomas of Lancaster, who had refused to join in the late campaign, took advantage of its results to place the king once more in complete tutelage. His household was dismissed, he was bidden to live as he could on an allowance of £10 a day, and all his ministers and baronial officials were changed. For more than three years Lancaster practically reigned in his cousin's name; it was soon found that the realm got no profit thereby, for Earl Thomas,
thorough neither so apathetic nor so frivolous as Edward, was
not a whit more competent to conduct either war or domestic
administration. The Scots swept everything before them,
ravaging the north at their will, and capturing Berwick.
They even made a great expedition to Ireland, where Bruce's brother
Edward was proclaimed king by the rebellious Celtic septs, and
rode across the whole island, exterminating the Anglo-Irish
population in many districts (1315-1317). But the colonists
rallied, and cut to pieces a great Irish army at Athyn (1316),
while in the next year Roger Mortimer, a hard-handed baron
of the Welsh march, crossed with reinforcements and drove back
Edward Bruce into the north. Resuming his advance after a
space, the rebel king was routed and slain at Dunclug (Oct. 14,
1318) and the insurrection died out. But it had had the perma-

nent result of weakening the king's grip on the north and west
of Ireland, where the English had been almost exterminated.
From this time forth until the reign of Henry VIII. the limit of
the country in full subjection to the crown was very shrinking,
and the Irish chiefs of the inland continued to pay less and less
attention to orders issued from Dublin or London.

Though the Scottish expedition to Ireland had been beaten
off, this was not in the least to be ascribed to the credit of
Lancaster, who was showing the greatest incompetence as an
administrator. He could neither protect the Border, nor even
prevent private civil wars from breaking out, not only on the
Welsh marches (where they had always been common), but even
in the heart of England. The most extraordinary symptom
of the time was a civic revolt at Bristol (1316), where the towns-
folk expelled the royal judges, and actually stood a siege before
they would submit. Such revolts of great towns were normal
in Germany or Italy, but almost unknown on this side of the
Channel. All this unrest might well be ascribed to Lancaster's
want of ability, but he had also to bear—with less justice—
the discontent caused by two years of famine and pestilence.
In August 1318 he was removed from power by a league formed
by Pembroke, Warenne, Arundel and others of the lords
ordinaries, who put a new council in power, and showed themselves
somewhat less hostile to the king than Earl Thomas had been.
Edward was allowed to raise an army for the siege of Berwick,
and was lying before its walls, when the Scots, turning his flank,
made a fierce foray into Yorkshire, and routed the shire-levy under
Archbishop Melton at the battle of Myton. This so disheartened
the king and the council that controlled him that they concluded
a two years truce with Robert of Scotland, thus for the first time
acknowledging him as a regular enemy and no mere rebel (1319).

The time of comparative quiet that followed was utilized
by the king in an attempt to win back some of his lost authority.

For a short space Edward showed more capacity
and energy than he had ever been supposed to possess.
Probably this was due entirely to the fact that he had
come under the influence of two able men who had
won his confidence and had promised him revenge for
the murdered Gaveston. These were the two Hugh Despensers,
father and son; the elder was an ambitious baron who hated
Lancaster, the younger had been made Edward's chamberlain in
1316 and had become his secret councillor and constant
companion. Finding that the king was ready to back them in
all their enterprises, the Despensers resolved to take the fearful
risk of snatching at supreme power by using their master's
name to oust the barons who were now directing affairs from
their position. The task was the more easy because Lancaster
was at open discord with the men who had supplanted him, so
that the baronial party was divided; while the misadventures of
the last six years had convinced the nation that other rulers could
be incompetent and as unable as their king's half-brother, the earl
of Norfolk, to rule. Edward and the Despensers, after trying in vain to raise an army, fled
into the west. They were all caught by their pursuers;
the two Despensers were executed—the one at Bristol, the other—at Hereford.
Several more of Edward's scanty band of friends—
the earl of Arundel and the bishop of Exeter and others—were
also slain. Their unhappy master was forced to abdicate on
the 20th of January 1327, his fourteen-year old son being proclaimed king in his stead. He was allowed to survive in close prison some eight months longer, but when his robust constitution defied all attempts to kill him by privations, he was murdered by the orders of the queen and Mortimer at Berkeley Castle on the 21st of September.

The three years regency of Isabella, during the minority of Edward III., formed a disgraceful episode in the history of England. She was as much the tool of Mortimer as her husband had been the tool of the Despensers, and their relations became gradually evident to the whole nation. All posts of dignity and emolument were kept for their personal adherents, and a new and formidable dignity was conferred on Mortimer himself, when he was made both justiciar of the principality of Wales, and also earl of March, in which lay both his own broad lands and the estates of Despenser and Arundel, which he had shamelessly appropriated. It is surprising that the adulterous pair succeeded in maintaining themselves in power for so long, since the ignomy of the situation was evident. They were even able to quell the first attempt at a reaction, by seizing and beheading Edmund, earl of Kent, the late king’s half-brother, who was betrayed while organizing a plot for their destruction. The one politic act of Mortimer’s administration, the conclusion of a permanent peace with Scotland by acknowledging Bruce as king (1328), was not one which made him more popular. The people called it “the shameful peace of Northampton,” and firmly believed that he had been bribed by the Scots.

Yet Isabella and her paramour held on to power for two years after the peace, and were only overthrown by a blow from an unexpected quarter. When the young king had reached the age of eighteen he began to understand the disgraceful nature of his own situation. Having secured promise of aid from Henry of Lancaster, his cousin, and other barons, he executed a coup de main, and seized Mortimer in his chambers at midnight. The queen was also put under guard till the parliament could be called. It met, and at the king’s demand passed sentence on the earl for the murder of Edward II. and other crimes. He was hanged at Tyburn (Nov. 1330); the queen suffered nothing worse than complete exclusion from power, and lived for more than twenty years in retirement on the manors of her dowry.

Edward III., who thus commenced his reign ere he was out of his boyhood, was, as might have been foretold from his prompt action against Mortimer, a prince of great vigour and enterprise. He showed none of his father’s weakness and much of his grandfather’s capacity. He fell short of Edward I. in steadiness of character and organizing power, but possessed all his military capacity and his love of work. Unfortunately for England his ambition was to be the mirror of chivalry rather than a model administrator. He took up and abandoned great enterprises with equal levity; he was reckless in the spending of money; and in times of trouble he was faultless of constitutional prudence, and apt to push his prerogative to extremes. Yet like Edward I. he was popular with his subjects, who pardoned him much in consideration of his knightly virtues, his courage, his ready courtesy and his love of adventure. In most respects he was a perfect exponent of the ideals and foibles of his age, and when he broke a promise or repudiated a debt he was but displaying the less satisfactory side of the habitual morality of the 14th century the chivalry of which was often deficient in the less showy virtues. With all his faults Edward during his prime was a capable and vigorous ruler; and it was not without reason that not England only but all western Europe looked up to him as the greatest king of his generation.

His early years were especially fortunate, as his rule contrasted in the most favourable way with that of his infamous mother and his contemptible father. The ministers whom he substituted for the creatures of Mortimer were capable, if not talented administrators. He did much to restore the internal peace of the realm, and put down the local disorders which had been endemic for the last twenty years. Moreover, when the war with Scotland recommenced he gave the English a taste of victory such as they had not enjoyed since Falkirk. Robert Bruce was now dead and his throne was occupied by the young David II., whose factious nobles were occupied in civil strife when, in 1332, a pretender made a snatch at the Scottish throne. This was Edward, the son of John Baliol, an adventurous baron who collected all the “disenherited” Scots lords, the members of the old English faction who had been expelled by Bruce, and invaded the realm at their head. He beat the regent Mar at the battle of Duppin, seized Perth and Edinburgh, and crowned himself at Scone. But knowing that his seat was precarious he did homage to the English king, and made him all the promises that his father had given to Edward I. The temptation was too great for the young king to refuse; he accepted the homage, and offered the aid of his arms. It was soon required, for Baliol was ere long expelled from Scotland. Edward won the battle of Halidon Hill (July 19, 1333)—where he displayed considerable tactical skill—captured Berwick, and reconquered a considerable portion of Scotland for his vassal. Unfortunately for himself he made the mistake of requiring too much from Baliol—forcing him to cede Lothian, Tweeddale and the larger part of Galloway, and to promise a tribute. These terms so irritated the Scots, who had shown signs of submission up to this moment, that they refused to accept the pretender, and kept up a long guerilla warfare which ended in his final expulsion. But the fighting was all on Scottish ground, and Edward repeatedly made incursions, showy if not effective, into the very heart of the northern realm; on one occasion he reached Inverness unopposed. He held Perth till 1339, Edinburgh till 1341, and was actually in possession of much Scottish territory when his attention was called off from this minor war to the greater question of the struggle with France. Meanwhile he had acquired no small military reputation, had collected a large body of professional soldiers whose experience was to be invaluable to him in the continental war, and had taught his army the new tactics which were to win Crecy and Poitiers. For the devices employed against the Scottish “schiltron” of pikemen at Duplin and Halidon, were the same as those which won all the great battles of the Hundred Years’ War—the combination of archery, not with cavalry (the old system of Hastings and Falkirk), but with dismounted men-at-arms. The nation, meanwhile prosperous, not vexed by overmuch taxation, and proud of its young king, was ready and willing to follow him into any adventure that he might indicate.

IV. THE HUNDRED YEARS’ WAR (1337-1453)

Wars between England and France had been many, since William the Conqueror first linked their fortunes together by adding his English kingdom to his Norman duchy. They were bound to recur as long as the kings who ruled on this side of the Channel were possessed of continental dominions, which lay as near, or nearer, to their hearts than their insular realm. When the kingdom of France was weak, monarchs like Henry II. and Richard I. might dream of extending their transmarine possessions to the detriment of their suzerain at Paris. When France had grown strong, under Philip Augustus, the house of Plantagenet still retained a broad territory in Gascony and Guienne, and the house of Capet could not but covet the possession of the largest surviving feudal appanage which marrèd the solidarity of their kingdom. There had been a long interval of peace in the 13th century, because Henry III. of England was weak, and Louis IX. of France an idealist, much more set on forwarding the welfare of Christendom than the expansion of France. But the inevitable struggle had recommenced with the accession of the unscrupulous Philip IV. Its cause was simple; France was incomplete as long as the English king ruled at Bordeaux and Bayonne, and far up the valleys of the Garonne and the Adour. From 1295 onward Philip and his sons had been striving to make an end of the power of the Plantagenets in Aquitaine, sometimes by the simple argument of war, more frequently by the insidious process of encroaching on ducal rights, summoning
litigants to Paris, and encouraging local magnates and cities alike to play off their allegiance to their suzerain against that to their imperator. Both in the time of Edward II. and in that of his son active violence had several times been called in to aid legal chicanery. Fortunately for the duke of Guinée the majority of his subjects had no desire to become Frenchmen; the Gascons felt no national sympathy with their neighbours of the north, and the towns in especial were linked to England by close ties of commerce, and had no wish whatever to break off their allegiance to the house of Plantagenet. The English rule, if often weak, had never proved tyrannical, and they had a great dread of French taxes and French officialism. But there were always individuals, more numerous among the noblesse than among the citizens, whose private interests impelled them to seek the aid of France.

The root of the Hundred Years' War, now just about to commence, must be sought in the affairs of Guinée, and not in any of the other causes which complicated and obscured the outbreak of hostilities. These, however, were sufficiently important in themselves. The most obvious was the aid which Philip VI. had given to the exiled David Bruce, when he was driven out of Scotland by Edward and his ally Balliol. The English king replied by welcoming and harbouring Robert of Artois, a cousin whom Philip VI. had expelled from France. He also made alliances with several of the dukes and counts of the Netherlands, and with the emperor Louis the Bavarian, obviously with the intention of raising trouble for France on her northern and eastern frontiers.

It was Philip, however, who actually began the war, by declaring Guinée and the other continental dominions of Edward III. forfeited to the French crown, and sending out a fleet which ravaged the south coast of England in 1337. In return Edward raised a claim to the throne of France, not that he had any serious intention of pressing it—for throughout his reign he always showed himself ready to barter it away for sufficient territorial gains—but as a claim was in several ways a useful asset to him both in war and in diplomacy. It was first turned to account when the Flemings, who had scruples about opposing their liege lord the king of France, found it convenient to discover that, since Edward was the real king and not Philip, their allegiance was due in the same direction whither their commercial interests drew them. Led by the great demagogue dictator, Jacob van Artevelde, they became the mainstay of the English party in the Netherlands.

Edward's claim—such as it was—rested on the assertion that his mother, Isabella, was nearer of kin to her brother Charles IV., the last king of the main line of the house of Capet, than was Charles's cousin Philip of Valois. The French lawyers ruled that heiresses could not succeed to the crown themselves, but Edward pleaded that they could nevertheless transmit their right to their sons. He found it convenient to forget that the last Capetian king, Charles IV., King Louis X., had left a daughter, whose son, the king of Navarre, had on this theory a title preferable to his own. This prince, he said, had not been born at the time of his grandfather's death, and so lost any rights that might have passed to him had he been alive at that time. A far more fatal bar to Edward's claim than the existence of Charles of Navarre was the fact that the peers of France, when summoned to decide the succession question nine years before, had decided that Philip of Valois had the sole valid claim to the crown, and that Edward had then done homage to him for Guinée. If he pleaded that in 1328 he had been the mere tool of his mother and Mortimer, he could be reminded of the unfortunate fact that in 1331, after he had crushed Mortimer, and taken the power into his own hands, he had deliberately renewed his oath to King Philip.

Edward's claim to the French crown embittered the strife in a most unnecessary fashion. It was an appeal to every discontented French vassal to become a traitor under a plausible show of loyalty, and from first to last many such persons utilized it. It also gave Edward an excuse for treating every loyal Frenchman as guilty of treason, and, to his shame, he did not always refrain from employing such a discernible device. Yet, as has been already said, he showed his consciousness of the fallacy of his claim by offering to barter it again and again during the course of the war for land or money. But he finally passed on the wretched fiction as a heritage of his descendants, to cause untold woes in the 15th century. It is seldom in the world's history that a hollow legal device such as this has had such long enduring and deplorable results.

In the commencement of his continental war Edward took little profit either from his assumption of the French royal title, or from the lengthy list of princes of the Low Countries whom he enrolled beneath his banner. His two land-campaigns of 1339 and 1340 led to no victories or conquests, but cost enormous sums of money. The Netherland allies brought large contingents and took high pay from the king, but they showed neither energy nor enthusiasm in his cause. When Philip of Valois refused battle in the open, and confined his operations to defending fortified towns, or stockading himself in entrenched camps, the allies drifted off leaving the king with his English troops in force too small to accomplish anything. The sole achievement of the early years of the war which was of any profit to Edward or his realm was the great naval triumph of Sluys (June 24, 1340), which gave the English the command of the sea for the next twenty years. The French king had built or hired an enormous fleet, and with it threatened to invade England. Seeing that he could do nothing on land while his communications with the Low Countries were endangered by the existence of this armada, Edward levied every ship that was to be found, and brought the enemy to action in the Flemish harbour of Sluys. After a day of desperate hand to hand fighting—for the vessels grappled and the whole matter was settled by boarding—the French fleet was annihilated. Henceforth England was safe from coast raids, could conduct her commerce with Flanders without danger, and could strike without difficulty any point of the French littoral. But it was not for some years that Edward utilized the advantages that Sluys had given him. As long as he persevered in the attempt to conduct the invasion of the northern frontier of France he achieved nothing.

Such schemes were finally abandoned simply because the king discovered that his allies were worthless and that his money was all spent. On his return from Flanders in 1340 he became involved in an angry controversy with his ministers, whom he accused, quite unjustly, of wasting his revenue and wrecking his campaign thereby. He imprisoned some of them, and wished to try his late chancellor, Archbishop Stratford, for embezzlement, in the court of the exchequer. But the prince contended very vigorously for the right to be tried before his peers, and since the king could get no subsidies from his parliament till he acknowledged the justice of this claim, he was forced to concede it. Stratford was acquitted—the king's thristlessness and the chancellor's maladministration had emptied the treasury. Edward drifted on along the path to financial ruin till he actually went bankrupt in 1345, when he repudiated his debts, and ruined several great Italian banking houses, who had been unwise enough to continue lending him money to the last. The Flemings were also hard hit by this collapse of the king's credit, and very naturally lost their enthusiasm for the English alliance. Van Artevelde, its chief advocate, was murdered by his own towns-people in this same year.

The second act of the Hundred Years' War, after King Edward had abandoned in despair his idea of invading France from the side of the Netherlands, was fought out in another quarter—the duchy of Brittany. Here a war of succession had broken out in which (oddly enough) Edward took up the cause of the pretender who had male descent, while Philip supported the one who represented a female line—each thus backing the theory of hereditary by which his rival claimed the throne of France. By espousing the cause of John of Montfort Edward obtained a good foothold on the
flank of France, for many of the Breton fortresses were put into his hands. But he failed to win any decisive advantage thereby over King Philip. It was not till 1346, when he adopted the new policy of trusting nothing to allies, and striking at the heart of France with a purely English army, that Edward found the fortune of war turning in his favour.

In this year he landed in Normandy, where the English banner had not been seen since the days of King John, and executed a destructive raid through the duchy, and up the Seine, till he almost reached the gates of Paris. This brought out the king of France against him, with a mighty host, before which Edward retreated northward, apparently intending to retire to Flanders. But after crossing the Somme he halted at Crecy, near Abbeville, and offered battle to the pursuing enemy. He fought relying on the tactics which had been tried against the Scots at Dupplin and Halidon Hill, drawing up his army with masses of dismounted men-at-arms flanked on either side by archery. This array proved as effective against the disorderly charges of the French noblesse as it had been against the heavy columns of the Scottish pikemen. Fourteen times the squadrons of King Philip came back to the charge; but mowed down by the arrows, they seldom could get to hand to hand with the English knights. But such was the disorder in his army. The astonishing victory over fourfold numbers was no mere chivalrous feat of arms, it had the solid result of giving the victors a foothold in northern France. For Edward took his army to beleaguer Calais, and after blockading it for nearly a year forced it to surrender. King Philip, after his experience at Crecy, refused to fight again in order to raise the siege. From henceforth the English possessed a secure landing-place in northern France, at the most convenient point possible, immediately opposite Dover. They held it for over two hundred years, to their own inestimable advantage in every recurring war.

The years 1345-1347 saw the zenith of King Edward's prosperity; in them fell not only his own triumphs at Crecy and Calais, but a victory at Auberoche in Périgord won by his cousin Henry of Lancaster, which restored many long-lost regions of Guienne to the English suzerainty (Oct. 21, 1345), and another and more famous battle in the far north. At Neville's Cross, near Durham, the lords of the north fell under the blows of David, King of Scotland (Oct. 17, 1346). The loss of their king and the destruction of a fine army took the heart out of the resistance of the Scots, who for many years to come could give their French allies little assistance.

In 1347 Edward made a short truce with King Philip; even after his late victories he felt his strength much strained, his treasury being empty, and his army exhausted by the year-long siege of Calais. But he would have returned to the struggle without delay had it not been for the dreadful calamity of the "Black Death," which fell upon France and England, as upon all Europe, in the years 1348-1349. The disease, on which the 14th century bestowed this name, was the bubonic plague, still familiar in the East. After devastating western Asia, it reached the Mediterranean ports of Europe in 1347, and spread across the continent in a few months. It was said that in France, Italy and England a third of the population perished, and though this estimate may be somewhat exaggerated, local records of unimpeachable accuracy show that it cannot be far from the truth. The bishop's account of the diocese of Norwich that many parishes had three and some four successive vicars admitted in eighteen months. In the manor rolls it is not uncommon to find whole families swept away, so that no heir can be detected to their holdings. Amongst the monastic orders, whose crowded common life seems to have been particularly favourable to the spread of the plague, there were cases where a whole community, from the abbot down to the novices, perished. The upper classes are said to have suffered less than the poor; but the king's daughter Joan and two archbishops of Canterbury were among the victims. The long continuance of the visitation, which as a rule took six or nine months to work out its virulence in any particular spot, seems to have cowed and demoralized society. Though it first spread from the ports of Bristol and Weymouth in the summer of 1348, it had not finished its destruction in northern England till 1350, and only spread into Scotland in the summer of that year.

When the worst of the plague was over, and panic had died down, it was found that the social conditions of England had been considerably affected by the visitation. The condition of the realm had been stable and prosperous during the earlier years of Edward III., the drain on its resources caused by heavy war-taxation having been more than compensated by the increased wealth that arose from growing commerce and developing industries. The victory of Sluys, which gave England the command of the seas, had been a great landmark in the economic no less than in the naval history of this island. But the basis of society was shaken by the Black Death; the kingdom was still essentially an agricultural community, worked on the manorial system; and the sudden disappearance of a third of the labouring hands by which that system had been maintained threw everything into disorder. The landowners found thousands of the crofts on which their rents were based for years immediately arable and rented out, with new tenants. Even if they exacted the full rigour of service from the survivors, they could not get their broad demesne lands properly tilled. The landless labourers, who might have been hired to supply the deficiency, were so reduced in numbers that they could command, if free competition prevailed, double and triple rates of payment, compared with their earnings in the days before the plague. Hence there arose, almost at once, a bitter strife between the lords of manors and the labouring class, both landholding and landless. The lords wished to exact all possible services from the former, and to pay only the old two or three pence a day to the latter. The villeins, as hard hit as their masters, resented the tightening of old duties, which in some cases had already been commuted for small money rents during the prosperous years preceding the plague. The landless men formed combinations, disputed with the landlords, and asked and often got twice as much as the old rates, despite of the murmurings of the employer.

After a short experience of these difficulties the king and council, whose sympathies were naturally with the landholders, passed two ordinances for the protection of the labourers of any kind that demanded more than they had been wont to receive before 1348. This was followed up by the famous Statute of Labourers, which fixed rates for all wages practically identical with those of the times before the Black Death. Those workmen who refused to accept them were to be imprisoned, while employers who went behind the backs of their fellows and secretly paid higher sums were to be punished by heavy fines. Later additions to the statute were devised to terrorize the labourer, by adding stripes and branding to his punishment, if he still remained recalcitrant or absconded. And landowners were empowered to seize all vagrant able-bodied men, and to compel them to work at the statutory wages. As some compensation for the low pay of the workmen, parliament tried to bring down the price of commodities to their former level, for (like labour) all manufactured articles had gone up immensely in value.

Thirty years of friction followed, while the parliament and the ruling classes tried in a spasmodic way to enforce the statute, and the peasantry strove to evade it. It proved impossible to frame a scheme for the labourers to be too numerous to be well paid. Thus, despite their efforts, the workmen were too many and too cunning to be crushed. If driven over hard they absconded to the towns, where hands were needed as much as in the countryside, or migrated to districts where the statute was laxly administered. Gradually the landowners discovered that the only practical way out of their difficulties was to give up the old custom of working the manorial demesne by the forced labour of their villeins, and to cut it up into farms which were rented out to free tenants, and cultivated by them. In the course of two
generations the "farmers" who paid rent for these holdings became more and more numerous, and demesne land tilled by villein-service grew more and more rare. But enough old-fashioned landlords remained to keep up the struggle with the peasants to the end of the 14th century and beyond, and the number of times that the Statute of Labourers was re-enacted and recast was enormous. Nevertheless the struggle turned gradually to the advantage of the labourer, and ended in the creation of the sturdy and prosperous farming yeomanry who were the strength of the realm for several centuries to come.

One immediate consequence of the "Black Death" was the renewal of the truce between England and France by repeated agreements which lasted from 1347 to 1355. During this interval Philip of France died, in 1350, and was succeeded by his son John. The war did not entirely cease, but became local and spasmodic. In Brittany the factions which supported the two claimants to the ducal title were so embittered that they never laid down their arms. In 1351 the French noblesse of Picardy, apparently without their master's knowledge or consent, made an attempt to surprise Calais, which was beaten off with some difficulty by King Edward in person. There was also constant bickering on the borders of Guienne. But the main forces on both sides were not brought into action till the series of truces ran out in 1355. From that time onward the English took the offensive with great vigour. Edward, prince of Wales, ravaged Languedoc as far as the Mediterranean, while his younger brother John of Gaunt, duke of Lancaster, executed a less ambitious raid in Picardy and Artois. In the south this campaign marked real progress, not mere objectless plunder, for it was followed by the reconquest of great districts in Périgord and the Agenais, which had been lost to England since the 13th century. A similar double invasion of France led to even greater results in the following year, 1356. While Lancaster landed in Normandy, and with the aid of local rebels occupied the greater part of the peninsula of the Cotentin, the prince of Wales accomplished greater things on the borders of Aquitaine. After executing a great circular sweep through Périgord, Limousin and Berry, he was returning to Bordeaux laden with plunder, when he was intercepted by the king of France near Poitiers. The battle that followed was the most astonishing of all the English victories during the Hundred Years' War. The odds against the prince were far heavier than those of Crécy, but by taking up a strong position and using the national tactics which combined the use of archery and dismounted men-at-arms, the younger Edward not merely beat off his assailants in a long defensive fight, but finally charged out upon them, scattered them, and took King John prisoner (Sept. 13, 1356).

This fortunate capture put an enormous advantage in the hands of the English; for John, a facile and selfish prince, was ready to buy his freedom by almost any concessions. He signed two successive treaties which gave such advantageous terms to Edward III. that the dauphin Charles, who was acting as regent, and the French states-general refused to confirm them. This drove the English king to put still further pressure on the enemy; in 1356 he led out from Calais the largest English army that had been seen during the war, devastated all northern France as far as Reims and the borders of Burgundy, and then—continuing the campaign through the heart of the winter—presented himself before the gates of Paris and ravaged the Île de France. This brought the regent Charles and his counsellors to the verge of despair; they yielded on the field of Poitiers (May 13, 1356), signed an armistice, and sent an embassage to Brétigny near Chartres, by which all King Edward's demands were granted. These preliminaries were ratified by the definitive peace of Calais (Oct. 24, 1356), which brought the first stage of the Hundred Years' War to an end.

By this treaty King Edward formally gave up his claim to the French throne, which he had always intended to use merely as an asset for barter, and was to receive in return not only a sum of 3,000,000 gold crowns for King John's personal ransom, but an immense cession of territory which—in southern France at least—almost restored the old boundaries of the time of Henry II. The duchy of Aquitaine was guaranteed to Edward, so as to include not only the lands that Edward had inherited, but also his recent conquests, but all Poitou, Limousin, Angoumois, Quercy, Rouergue and Saintonge—a full half of France south of the Loire. This vast duchy the English king bestowed not long after on his son Edward, the victor of Poitiers, who reigned there as a vassal-sovereign, owing homage to England but administering his possessions in his own right. In northern France, Calais and the county of Guines, and also the isolated county of Ponthieu, the inheritance of the wife of Edward I., were ceded to the English crown. All these regions, it must be noted, were to be held for the future free of any homage or acknowledgment of allegiance to an overlord, "in perpetuity, and in the manner in which the kings of France had held them." There was to be an end to the power of the courts of Paris to harass the duke of Aquitaine, by using the rights of the suzerain to interfere with the vassal's subjects. It was hoped that for the future the insidious legal warfare which had been used with such effect by the French kings would be effectually prevented.

To complete the picture of the triumph of Edward III. at this, the culminating point of his reign, it must be mentioned that some time before the peace of Calais he had made terms with Scotland. David Bruce was to cede Roxburgh and Berwick, but to keep the rest of his dominions on condition of paying a ransom of 100,000 marks. This sum could never be raised, and Edward always had it in his power to bring pressure to bear on the king of Scots by demanding the instalments, which were always in arrear. David gave no further trouble; indeed he became so friendly to England that he offered to proclaim Lionel of Clarence, Edward's second son, as his heir, and would have done so but for the vigorous opposition of his parliament.

The English people had expected that a sort of Golden Age would follow the conclusion of the peace with Scotland and France. Freed from the war-taxes which had vexed them for the last twenty years, they would be able to repair the ravages of the Black Death, and to develop the commercial advantages which had been won at Sluys, and secured by the dominion of the seas which they had held ever since. In some respects this expectation was not deceived; the years that followed 1356 seem to have been prosperous at home, despite the continued friction arising from the Statute of Labourers. The towns would seem to have fared better than the countryside, partly indeed at its expense, for the discontented peasantry migrated in large numbers to the centres of the population where newly-developed manufactures were calling for more hands. The weaving industry, introduced into the eastern counties by the king's invitation to Flemish settlers, was making England something more than a mere producer of raw material for export. The seaports soon recovered from their losses in the Black Death, and English shipping was beginning to appear in the distant seas of Portugal and the Baltic. Nothing illustrates the growth of English wealth better than the fact that the kingdom had, till the time of Edward III., contrived to conduct all its commerce with a currency of small silver, but that within thirty years of his introduction of a gold coinage in 1343, the English "noble" was being struck in enormous quantities. It invaded all the markets of western Europe, and became the prototype of the gold issues of the Netherlands, Scotland, and even parts of Germany. It is in the latter years of Edward III. that we find the first forerunners of the English merchant princes who were to be such a marked feature of the succeeding reigns. The city of Hull, whose descendants rose in three generations to ducal rank, were the earliest specimens of their class. The poet Chaucer may serve as a humbler example of the rise of the burger class—the son of a vintner, he became the father of a knight, and the ancestor, through female descent, of many baronial families. The second half of the 14th century is the first period in English history in which we can detect a distinct rise in the importance
of the commercial as opposed to the landed interest. The latter, hard hit by the manorial difficulties that followed the plague of 1348–1349, found their rents stationary or even diminishing, while the price of the commodities from which the former made their wealth had permanently risen.

As an intellectual vigour, the age that produced two minds of such marked originality in different spheres as Wycliffe and Chaucer must not be despised, even if it failed to carry out all the promise of the 13th century.

For a few years after the peace of 1360 the political influence of Edward III, in western Europe seemed to be supreme. France, prostrated by the results of the English raids, by peasant revolts, and municipal and baronial turbulence, did not begin to recover strength till the thriftless king of Prance, John had died (1364) and had been succeeded by his capible if unchivalrous son Charles V. Yet the state of the English dominions on the continent was not satisfactory; in building up the vast duchy of Aquitaine Edward had made a radical mistake. Instead of contenting himself with creating a homogeneous Gascon state, which might have grown together into a solid unit, he had annexed broad regions which had been for a century and a half united to France, and had been entirely assimilated to her. From the first Poitou, Quercy, Rouergue and the Limousin chafed beneath the English yoke; the noblesse in especial found the comparatively orderly and constitutional governance to which they were subjected most intolerable. They waited for the first opportunity to revolt, and meanwhile murmured against the act of their duke, the prince of Wales, though he did his best to behave as a gracious sovereign.

The younger Edward ended by losing his health and his wealth in an unnecessary war beyond the Pyrenees. He was persuaded by the exiled Peter the Cruel, king of Castile, to restore him to the throne which he had forfeited by his misgovernment. In 1367 he gathered a great army, entered Castile, defeated the usurper Henry of Trastamara at the battle of Najera, and restored his ally. But Peter, when once re-established as king, forgot his obligations and left the prince burdened with the whole expense of the campaign. Edward left Spain with a discontented and unpaid army, and had himself contracted the seeds of a disease which was to leave him an invalid for the rest of his life. To pay his debts he was obliged to resort to heavy taxation in Aquitaine, which gave his discontented subjects in Poitou and the other outlying districts an excuse for the rebellion that they had been for some time meditating. In 1368 his greatest vassals, the counts of Armagnac, Périgord and Comminges, displayed their disloyalty by appealing to the king of France as their suzerain against the levity of Edward's new impost. The Eng and executed coup d'état at eighteen, were often worn out by sixty. The guidance of the war should have fallen into the hands of his eldest son, the victor of Poitiers and Najera, but the younger Edward had never recovered from the fatigues of his Spanish campaign; his disease having developed into a form of dropsy, he had become a confirmed invalid and could no longer take the field. The charge of the military operations of the English armies had to be transferred to John of Gaunt, duke of Lancaster, the king's younger son, a prince far inferior in capacity to his father and brother. Though not destitute of good impulses Lancaster was hasty, improvident and obstinate; he was unfortunate in his choice of friends, for he allied himself to all his father's unscrupulous dependents. He was destitute of military skill, and wrecked army after army by attempting hard tasks at inappropriate times and by mistaken methods. Despite of all checks and disasters he remained active, self-confident and ambitious, and, since he had acquired a complete control over his father, he had ample opportunity to mismanage the political and military affairs of England.

Lancaster's strategy, in the early years of the renewed war, consisted mainly of attempts to wear down the force of France by devastating raids; he hoped to provoke the enemy to battle by striking at the heart of his realm, but never achieved his purpose. Warned by the disasters of Crécy and Poitiers, Charles V. and his great captain Bertrand du Guesclin would never commit themselves to an engagement in the open field. They let the English invaders pass by, garrisoning the towns but abandoning the countryside. Since Lancaster, in his great circular raids, had never the leisure to be drawn to a siege—generally a matter of long months in the 14th century—he repeatedly crossed France leaving a train of ruined villages behind him, but having accomplished nothing else save the exhaustion of his own army. For the French always followed him at a cautious distance, cutting off his stragglers, and restricting the area of his ravages by keeping flying columns all around his path. But while the duke was executing useless marches across France, the outlying lands of Aquitaine were falling away, one after the other, to the enemy. The limit of the territory which still remained loyal was ever shrinking, and what was once lost was hardly ever regained. Almost the only reconquest made was that of the city of Limoges, which was stormed in September 1370 by the troops of the Black Prince, who rose from his sick-bed to strike his last blow at the rebels. His success did almost as much harm as good to his cause, for the deliberate sack of the city was carried out with such ruthless severity that it roused wild wrath rather than terror in the neighbouring regions. Next spring the prince returned to England, feeling himself physically unable to administer or defend his duchy any longer.

The greater part of Poitou, Quercy and Rouergue had been lost, and the English cause was everywhere losing ground, when a turn of disastrous events was about to overtake Stephen. In 1369 he had never disputed the command of the seas; but in 1372 a Spanish fleet joined the French, and destroyed off La Rochelle a squadron which was bringing reinforcements for Guienne. The disaster was the direct result of the campaign of Najera—for Henry of Trastamara, who had long since dechned and slain his brother Peter the Cruel, remained a consistent foe of England. From this date onward Franco-Spanish fleets were perpetually to be met not only in the Bay of Biscay but in the Channel; they made the voyage to Bordeaux unsafe, and often executed descents on the shores of Kent, Sussex, Devon and Cornwall. It was to no effect that, in the year after the battle of La Rochelle, Lancaster carried out the last, the most expensive, and the most fruitless of his great raids across France. He marched from Calais to Bordeaux, inflicted great misery on Picardy, Champagne and Berry, and left half his army dead by the way.

This did not prevent Bertrand du Guesclin from expelling from his dominions John of Brittany, the one ally whom King Edward possessed in France; or from pursuing a consistent career of petty conquest in the heart of Aquitaine. By 1374 little was left of the great possessions which the English had held beyond the Channel save Calais, and the coast slip from Bordeaux to Bayonne, which formed the only loyal part of the duchy of Guienne. Next year King Edward sued for peace—he failed to obtain it, finding the French terms too hard for acceptance—
but a truce at least was signed at Bruges (Jan. 1375) which endured till a few weeks before his death.

These two years of Edward's reign were filled with an episode of domestic strife, which had considerable constitutional importance. The nation ascribed the series of disasters which had filled the space from 1359 to 1375 entirely to the maladministration of Lancaster and the king's favourites, failing to see that it was largely due to the mere fact that England was not strong enough to hold down Aquitaine, when France was administered by a capable king and served by a great general. Hence there arose, both in and out of parliament, a violent agitation for the removal of Lancaster from power and the punishment of the favourites, who were believed, with complete justification, to be misusing the royal name for their own private profit. Among the leaders of this agitation were the clerical ministers whom John of Gaunt had expelled from office in 1371, and chiefly William of Wykeham, bishop of Winchester, the late chancellor; they were helped by Edmund Mortimer, earl of March, a personal enemy of Lancaster, and could count on the assistance of the prince of Wales when he was well enough to take a part in politics. The greater part of the House of Commons was on their side, and on the whole they may be regarded as the party of constitutional protest against the maladministration. But there was another foot at the same time, which cut across this political agitision in the most bewildering fashion. Protests against the corruption of the Church and the interference of the papacy in national affairs had always been rife in England. At this moment they were more prevalent than ever, largely in consequence of the way in which the popes at Avignon had made themselves the allies and tools of the kings of France. The Statutes of Praemunire and Provisions had been passed a few years before (1351-1365) to check papal pretensions. There was a strong anti-clerical party, whose practical aim was to fill the coffers of the state by large measures of disendowment and confiscations of Church property. The intellectual head of this party at the time was John Wycliffe, a famous Oxford teacher, and for some time master of Balliol College.

In his lectures and sermons he was always laying stress on the unsatisfactory state of the national church and the infamous corruption of the papacy. The doctrine which first made him famous, and commended him to all members of the anti-clerical faction, was that unworthy holders of spiritual endowments ought not to be respected, because most honest men should depend on "good" Churchmen, small and great, as he held, had been corrupted, because they had fallen away from the early Christian idea of apostolic poverty. Instead of discharging their proper functions, bishops and abbots had become statesmen or wealthy barons, and took no interest in anything save politics. The monasteries, with their vast possessions, had become corporations of landlords, instead of associations for prayer and good works. The papacy, with its secular ambitions, and its insatiable greed for money, was the worst abuse of all. A bad pope, and most popes were bad, was the true Antichrist, since he was always overrunning the divine law of the scriptures by his human ordinances. Every man, as Wycliffe taught—using the feudal analogies of contemporary society—is God's tenant-in-chief, directly responsible for his acts to his lord; the pope is always thrusting himself in between, like a meene-tenant, and destroying the touch between God and man by his interference. Sometimes his commands are merely presumptuous; sometimes—as when, for example, he preaches crusades against Christians for purely secular reasons—that is an instance of the most wicked form of blasphemy. Wycliffe at a later period of his life developed观点 on doctrinal matters, not connected with his original thesis about the relations between Church and State, and foreshadowed most of the leading tenets of the reformers of the 16th century. But in 1376-1377 he was known merely as the outspoken critic of the "Caesarean clergy" and the papacy. He had a following of enthusiastic disciples at Oxford, and scattered adherents both among the burghers and the knighthood, the nucleus of the party that afterwards became famous as the Lollards. But they had not yet differentiated themselves from the body of those who were merely anti-clerical, without being committed to any theories of religious reform.

Since Wycliffe was, above all things, the enemy of the political clergy of high estate, and since those clergy were precisely the leaders of the attack upon John of Gaunt, it came to pass that hatred of a common foe drew the duke and the doctor together for a space. There was a strange alliance between the advocate of clerical reform, and the practical exponent of secular misgovernment. The only point on which they were agreed was that it would be highly desirable to strip the Church of most of her endowments, in order to fill the exchequer of the state. Lancaster hoped to use Wycliffe as his mouthpiece against his enemies; Wycliffe hoped to see Lancaster disendowing bishops and monasteries and defying the pope. Hence the attempt of the political bishops to get Wycliffe condemned as a heretic became inexplicably mixed with the attempt of the constitutional party, to which the bishops belonged, to evict the duke from his position of first councillor to the king and director of the policy of the realm.

The struggle began in the parliament of 1376, called by the anti-Lancastrian party the "Good Parliament." Headed by the earl of March, William of Wykeham, bishop of London, and Sir Peter de la Mare, the miring operations of the House of Commons, the duke's enemies began their campaign by accusing the king's ministers and favourites of corruption. Here they were on safe ground, for the misdeeds of Lord Latimer—the king's chamberlain, Lord Neville—his steward, Richard Lyons—his financial agent, and Alice Perrers—his greedy and shameless mistress, had been so flagrant that it was hard for Lancaster to defend them. In face of the evidence brought forward the old king and his son had to abandon their friends to the angry parliament. Latimer and Lyons were condemned to imprisonment and forfeiture of their goods, Alice Perrers was banished from court. Encouraged by this victory, the parliament passed on to constitutional reforms, forced on the king a council of twelve peers nominated by themselves, who were to exercise over him much the same control that the lords ordinances had held over his father, and compelled him to assent to a long list of petitions which, if properly carried out, would have removed most of the practical grievances of the nation. Having so done the duke disagreed; mistaking that Lancaster had yielded so easily because he was set on undoing their work the moment that they were gone.
